The Board of Supervisors of any county where the United States has authorized flood control improvements, including channel clearing, cut-offs, levees, and dams is authorized, in relation to such project, to assure the federal government that it will: (1) provide all necessary lands, easements, and rights-of-way; (2) hold the United States free from any damages due to construction; and (3) maintain and operate the works after completion. Additional powers of said counties include the right to: (1) levy and assess taxes; (2) exercise eminent domain; (3) accept conveyances of land; and (4) accept agreements from benefitted landowners to save the county harmless on account of said assurances given by the county. The board of supervisors of any county on the Mississippi in which a national park or cemetery is located may additionally levy a county-wide tax to supplement the construction and maintenance of the project. When the needed land is outside the county, the county is empowered to contribute to the cost of acquiring such land. All moneys paid to the state by the federal government for leases of flood control lands shall be apportioned to the counties in which such lands are located. (Schram-Florida)

SILVER BLUE LAKES APARTMENTS V SILVER BLUE LAKE HOME OWNERS ASS'N INC (UNREASONABLE USE OF ARTIFICIAL WATERBODY).
225 So2d 557-561 (3 DCA Fla 1969).

Descriptors: *Judicial decisions, *Legal aspects, *Florida, *Lakes, Riparian rights, Ownership of beds, Usufructuary right, Relative rights, Remedies, Riparian land, Surface waters.
Identifiers: *Man-made lakes, Injunctions (Prohibitory).

The owners of land underlying a man-made lake sought to enjoin an allegedly unreasonable use of the surface of the lake by tenants of an apartment complex bordering on the lake. The trial court issued the injunction to permanently enjoin the tenants from using the lake and restricting use to owners of the underlying land. The corporate owner of the apartments appealed, alleging that said injunction violated his constitutional rights. The district court of appeal affirmed saying that no rights of the owner were disturbed as he could still use the lake as an owner. The tenants, however, were not owners of underlying land. Therefore, they could be completely enjoined from using the lake because their use was unreasonable and made it impossible for the actual owners to exercise their right to use the lake. The corporate owner would

not be permitted to control the use of this man-made lake by multiplying its right of use by the number of tenants claiming under the corporation. (Darragh-Florida)
W70-01154

SURFACE RUNOFF AND FLOODWATER DIVERSION.

Va Code Ann secs 62.1-105, 62.1-106 (1968).

Descriptors: *Virginia, *Riparian rights, *Surface runoff, *Impounded water, Diversion, Water permits, Floodwater, Water levels, Prior appropriation, Priorities, Administration, Diversion structures, Water control, Water injury, Water law, Water rights, Water storage, Average flow, Damages, Legislation, Impoundments, Legal aspects.
Identifiers: Floodwater diversion.

A landowner may capture surface runoff waters on his land provided the capture does no damage to others. Upon approval, riparian owners may capture or impound water in watercourses which is over and above the average flow of the stream if: (1) the capture or storage will not damage others; (2) the riparian owner owns the land on which the water will be stored; (3) the riparian owner bears all costs of impounding the water; (4) a registered civil or agricultural engineer approves of the construction of the impounding facilities; and (5) the capture of water will not decrease the average flow in the watercourse. Upstream riparian owners have priority to the right to store floodwaters. (McDonough-Florida)
W70-01177

MILLS, DAMS, AND CERTAIN OTHER WORKS ON WATERCOURSES.

Va Code Ann secs 62.1-116, 62.1-119, 62.1-124 (1968).

Descriptors: *Virginia, *Mills, Mill dams, *Canals, Legislation, Public benefits, Public health, Dams, Dam construction, Barriers, Diversion structures, Fish barriers, Overflow, Navigation, Compensation, Riparian rights, Water law, Watercours (Legal), Canal construction, Administrative agencies, Water works, Relative rights.
Identifiers: *Obstructions to navigation.

A person owning a water mill useful to the public and desiring leave to erect a dam across or in the bordering watercourse, or to cut or enlarge a canal through lands above or below, or to raise a dam, or to construct a work on or through the lands of another to confine the watercourse, may apply to the circuit court of the county wherein such mill is located for such permission. Commissioners, appointed to decide such issue, must inquire whether any lands will be overflowed, navigation and the passage of fish will be obstructed, or the health of the neighbors will be annoyed by the stagnation of the waters or otherwise. They must also circumscribe the lands necessary for the canal, dam, or work not being more than one acre for a dam, nor more than one hundred feet in width for a canal, and must ascertain a just compensation. Any lands which will be adversely affected shall likewise be examined and compensation ascertained. These results must be set forth in a report. No person may by means of any such leave draw the water from any millpond of another or do anything in conflict with any vested right in any waterworks erected on such watercourse. (Schram-Florida)

IMPROVEMENT OF NAVIGABILITY OF STREAMS.

Va Code Ann secs 62.1-155 thru 62.1-158 (1968).

Descriptors: *Virginia, *Navigable rivers, *Navigation, *Channel improvement, Legislation, Easements, Right-of-way, Legal aspects, Permits, Pipelines, Transportation, Drainage systems, Bridges, Oysters, Shellfish, Clams, Local governments, Federal government, Water resources development, Utilities, River basin development, Dredging.

All cities situated on navigable streams may cooperate with the United States in the deepening, widening, and straightening of the channels thereof to improve navigability and in making provision for turning basins at terminals and mooring areas thereon. Such cities may assure the United States that they will: (1) furnish lands, easements, and rights-of-way and spoil or dredged material disposal areas; (2) furnish permits for ingress and egress to highways, construction of pipeline trestles across oyster and clamming grounds, and laying dredge pipelines across adjacent lands; (3) hold the United States free from damages; (4) relocate roads, bridges, waterfront structures, sewerage, water supply, and other utility facilities; (5) construct, maintain, expand, and operate terminal facilities; and (6) contribute funds for mooring areas adjacent to river terminals of such cities when necessary because of expansion of such terminal facilities. Such cities have the power to irrevocably bind themselves to do anything necessary to execute the above assurances. Claims for damages to oyster and clamming grounds may be asserted in the courts having jurisdiction in the county or city in which such damages occur. (Schram-Florida)

DUTIES OF DIRECTOR OF PUBLIC WORKS.
R I Gen Laws Ann secs 46-1-1, 46-1-2 (1956)

Descriptors: *Rhode Island, *Administrative agencies, *Harbors, *Supervisory control (Power), Tidal waters, Utilities, Public rights, Surveys, Navigation, State governments, State jurisdiction, Legislation, Water law, Legal aspects, Regulation, Administration.
Identifiers: Obstructions.

The Director of Public Works has control and supervisory power over all harbors and tidewaters in the state. The Director may order the removal of unauthorized obstructions and encroachments in harbors and tidewaters and may survey harbors and public waters to protect state interests. (McDonough-Florida)
W70-01182

CONSTRUCTION OF PORT FACILITIES.

R I Gen Laws Ann secs 46-5-1 thru 46-5-16 (1956), as amended, (Supp 1968).

Descriptors: *Rhode Island, *Harbors, *Port authorities, *Coastal engineering, Coastal structures, Navigation, Transportation, Eminent domain, Land tenure, Riparian rights, Piers, Channeling, Channels, Bulkheads, Landfills, Rates, Public benefits, Administrative agencies, State governments, Public lands, Legal aspects, Legislation, Leases, Docks, Basins, Condemnation.

The Department of Natural Resources may acquire by purchase, lease, or condemnation any real property, tide-flowed lands, plats, terms, easements, privileges, foreshore, riparian rights, littoral rights, and uplands as are necessary for public use. Title to such land shall vest in the state. Procedures are set forth herein for the taking of such lands. The Department may utilize such land for the construction of wharves, piers, bulkheads, slips, docks, basins, channels, and other port facilities, and may establish rates for the wharfage, cranage, and dockage of all vessels admitted thereto. The Department may also: (1) control and manage a portion of such facilities for public use; (2) lease the facilities; (3) establish regulations and penalties for the care of the acquired property; and (4) dispose of lands no longer needed. The administration of the division of fish and game in the Department of Agriculture and Conservation may expend the funds herein appropriated to establish and maintain yacht and boat moorings. Such moorings shall be available to the public without charge. (Marsee-Florida)

OBSTRUCTIONS TO NAVIGATION.
R I Gen Laws Ann secs 46-6-1 thru 46-6-16 (1956).

Descriptors: *Rhode Island, *Navigation, *Administrative agencies, *Regulation, Landfills, Tidal waters, Abatement, Cost allocation, Costs, Cost repayment, Cost transfer, Bays, Rivers, Boats, Piers, Bridges, Bridge construction, Oysters, Ships, Legislation, Federal government, State governments, Riparian rights.
Identifiers: *Shipwrecks, *Obstruction to navigation.

The Director of Public Works regulates the depositing of dirt and other substances into public tidewaters, and plans for the filling of tide flats or the construction of wharves, piers, bridges, or other structures over public tidewaters must be approved by the Department of Public Works. Unauthorized encroachments on tidewater constitute a public nuisance and may be abated. Special provisions are made for the protection from obstruction of certain specified watercourses. The Director of Public Works shall remove or have removed wrecked, sunken, or abandoned vessels and other obstructions from state tidewaters. The cost of such removal is distributed as herein provided. It is the duty of commissioners of wrecks and shipwrecked goods and of harbor masters to give immediate notice to the Department of Public Works of all shipwrecks and obstructions existing in tidewaters of their town or harbor. The Director may apply for federal reimbursement of removal expenses which might properly be paid thereby. Nothing herein shall impair the rights of riparian proprietors to construct wharves pursuant to law. (Marsee-Florida)

FIELD EVALUATION OF SEEPAGE MEASUREMENT METHODS,
Idaho Univ., Moscow; and Agricultural Research Service, Kimberly, Idaho. Smake River Research Center.
C. E. Brockway, and R. V. Worstell.
Second Seepage Symposium, Proceedings, Phoenix, Arizona, Mar 25-27, 1968. Agricultural Research Service, Washington, DC, ARS 41-147, 1969. 7 p, 3 fig, 2 tab.

Descriptors: *Seepage, *Seepage losses, *Evaluation, *Canal seepage, *Field tests, Ponding, Pondng tests, Measurement, Reaches (Distance), daho, Costs, Field data.
dentifiers: Seepage meters, Inflow-outflow measurement, Minidoka Project (Idaho).

Experiments with ponding tests, seepage meters, nd inflow-outflow methods for measuring seepage rom canals were conducted in 1965-66 on the Minidoka Project in Idaho. The ponding test is the nost accurate but the most expensive. Using eepage meters for obtaining estimates is fast and economical; however, new types of meters capable f functioning in canals at operating depth should e developed and studied. Almost all available meers are capable of measuring seepage with easonable accuracy, but discretion must be used in he amount of confidence placed in average values letermined from meter tests. The procedure outined for estimating the number of meter tests equired can be used to judge the confidence to be laced in any group of tests. Inflow-outflow nethods are usually too expensive for short-duraion seepage measurements; however, a good installation does indicate seasonal changes in loss ates. Accuracy of inflow-outflow determinations is imited by flow-measuring devices, but for canals vith large seepage losses, inflow-outflow methods nay be the most expedient and sufficiently accurate. (USBR)

REVIEW OF METHODS FOR MEASURING AND PREDICTING SEEPAGE,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
Herman Bouwer, and Robert C. Rice.
Second Seepage Symposium, Proceedings, Phoenix, Arizona, Mar 25-27, 1968. Agricultural Research Service, Washington, DC, ARS 41-147, 1969. 6 p, 12 ref.

Descriptors: *Seepage, *Canal seepage, *Reviews, *Measurement, Ponding tests, Methodology, Forecasting, Seepage losses, Hydraulic conductivity, Water table, Ponding, Infiltration, Electric analogs, Instrumentation, Mathematical analysis, Hydraulic models.
Identifiers: Inflow-outflow measurement, Salt penetration method, Seepage meters.

Direct measurement of seepage can be obtained by inflow-outflow, ponding, seepage-meter, and salt-penetration techniques. Salt penetration is a recently developed tracer technique whereby seepage is determined from the rate of advance of dissolved salt in the bottom material. Advantages and disadvantages of the various techniques are discussed. Another approach for obtaining quantitative seepage information is to calculate the seepage rate from the hydraulic conductivity profile of the soil and the position of the groundwater table. Solutions can be obtained by mathematical analysis or by analog or model studies. Analyses by resistance network analog and the resulting dimensionless graphs for determining the seepage rate are discussed. In certain cases, knowing seepage in relation to time after water has entered a dry channel will be of interest. This is a problem of 2-dimensional infiltration, showing how simplified solutions can be obtained. (USBR)

Tech Rep Ser H-W Hydrol Water Resources Publication No 3, Reno, July 1967. 46 p, 1 fig, 38 ref.

Descriptors: *Groundwater mining, *Water managment (Applied), *Mathematical models, *Optimization, *Resource development, Decision making, Water rights, Water levels, Economics, Monetary benefits.

Problems of groundwater management and development in terms of valuation of a resource or property that represented a source of future money receipts were discussed. A mathematical model was developed which gave both present worth of gains forthcoming from resources exploitation over a variable time period, and the remaining worth of a groundwater supply after it had been partially depleted. With the water level position selected as the denominator common to both the system and its economic worth, a course of exploitation was charted so that (1) present worth of future returns was maximized, and (2) water rights were protected to the extent that water levels were not lowered below the economic limit of pumping. The results enabled a conceptual valuation of (1) decision rules for efficiency in management, (2) optimal mining yield for specified conditions, and (3) the state of development of the resource at any time. BASIC CONCEPTS IN GROUND WATER LAW,
A. P. Black.
Am Water Wks Ass'n J, Vol 39, No 10, p 989-1001, Oct 1947. 13 p, 15 ref.

Descriptors: *Groundwater, *Legislation, *Water utilization, *Water allocation (Policy), Administration, Competing uses, Consumptive use, Domestic water, Beneficial use, Reasonable use, Riparian rights, Percolating water, Withdrawal, Priorities, Well regulation, Administrative agencies, Water rights, Water law, Prior appropriation, Preferences (Water rights).

The growing need for legislation to deal adequately with the use of ground water supplies is examined. The author discusses the limitations and advantages of the three major rules which are the basis of most legislation on ground water rights: the common-law doctrine, the American rule of reasonable use, and the doctrine of prior appropriation. The author suggests the following basic concepts which should be incorporated into legislation for the control of ground water. Beneficial use should be the basis, the measure, and the limit to the use of water. The program should be administered on the state level by an agency with the power, subject to judicial review, to determine water rights. Vested rights to the use of water should be recognized to the greatest extent consistent with existing conditions in the area. Use of water for domestic purposes should be specifically exempted from the provisions of the statute. Reasonable limits, within which a later appropriation could rightfully lower the head of water, should be included. Finally, the right of eminent domain should assure towns and cities water supplies adequate for present and future use. (Gabrielson-Florida)

CIVIL LAW PROPERTY--ENCROACHMENTS ON RIVER BANKS BY RIPARIAN OWNERS,
Gillis W. Long.
La L Rev, Vol 9, No 4, p 542-545, May 1949. 4 p, 16 ref.

Descriptors: *Louisiana, *Banks, *Public rights, *Land tenure, Judicial decisions, Legislation, Riparian rights, Relative rights, Riparian land, Civil law, Structures, Buildings, Water law, Cities, Navigable waters.

And elementary legal principle is that the banks of navigable streams are public. The Louisiana courts have traditionally been uniform in sustaining injunctions preventing erection and ordering removal of permanent installations on property subject to this public servitude. Early Louisiana law provided that it was sufficient to warrant removal of a structure if the public use was merely obstructed or 'interrupted.' Early cases provided that the owners of riparian land could not use the bank as private property, and encroachments could be removed at the instance of municipal officers or by individuals living within the municipal corporation. Article 862 of the Louisiana Civil Code allows minor encroachments upon banks and has occasionally been invoked when the interference with the bank was negligible or the cost of removal was prohibitive. In Town of Madisonville v Dendinger, 38 So 2d 252 (La 1948), the court seems to have altered the basis for removal of structures from the more restrictive 'obstruct or embarrass the use' test to allowing the structure to remain under Article 862, unless it 'prevents the use' of the bank by the public completely. The court felt the plaintiff had not made out a case of prevention of use, and the decision marks a permissive trend which may be explained by a decline in water transporation and a rise in the need of industry to utilize bank space. Identifiers: Air pollution control, Pollution control.

Environment has become an emotionally charged word on a par with such phrases as 'student revolts' or 'Raquel Welch,' depending upon which emotion you want charged. The facts and projections on environmental prospect are frightening and the challenge must be met, but we also suffer from misunderstanding, and need a rational outlook to clarify man's relationship with the environment. Talking of the balance of nature is quite fashionable today, implying that with a hands-off policy, natural process would somehow adjust all to everyone's benefit; this is not true. Nature pollutes and destroys; history records many earthquakes, volcanic eruptions, floods, and plagues. Modern man cannot be totally objective when his own survival is at stake; he must occasionally do some tampering with the balance of nature to favor himself. Man-made environment problems are a result of population growth, excessive and unplanned use of technology, neglect and lack of self-imposed standards, and inability to anticipate detrimental effects of a technology. The problems will not be solved by turning off a faucet marked technology. The difficult task ahead will take new thinking, cooperation among many people, and choosing between new alternatives. APPLICATION OF PYROLYTIC GAS CHROMATOGRAPHY TO NATURAL WATERS,
Rocketdyne, Canoga Park, Calif. Research Div.
K. H. Nelson, and I. Lysyj.
Water Research, Vol 3, No 5, p 357-365, May 1969. 9 p, 7 fig, 20 ref. Office of Saline Water Contract 14-01-0001-965.

Descriptors: *Pollutant identification, *Gas chromatography, *Analytical techniques, *Organic compounds, Organic matter, Water quality, Streams, Reservoirs, Ecological distribution, Water properties, Water chemistry.
Identifiers: *Pyrolitic gas chromatography.

A modified pyrographic technique for characterization of nonvolatile organics in aqueous solutions is described. This method was developed from a pyrolytic procedure for the determination of the total organic content of natural waters. In the modified technique, pyrolysis of the organic matter without prior separation from the water is followed by gas chromatographic separation and flame ionization detection of the produced organic fragments. The organic composition of the samples then can be calculated from the pyrolytic spectrums. The method was applied to natural waters from several localities in the western part of the United States. Differences were observed in the number and intensities of peaks on the pyrograms. Investigations are underway to develop, improve, and adapt the technique for determination of organic matter in water, both particulate and dissolved, and to determine the role of organic matter in stream ecology. A RAPID FOR MEASURING THE ACUTE TOXICITY OF DISSOLVED MATERIALS TO MARINE FISHES,
National Inst. for Water Research, Congella (South Africa). Regional Lab.
J. A. Ballard, and W. D. Oliff.
Water Research, Vol 3, No 5, p 313-333, May 1969. 21 p, 12 fig, 13 tab, 7 ref.

Descriptors: *Analytical techniques, *Toxicity, *Pollutants, *Dissolved oxygen, Poisons, Phenols, Fish, Lethal limit, Water temperature, Dissolved oxygen analyzers.
Identifiers: *Acute toxicity measurement, *Marine fish poisoning, Fish diseases.

A method is given for measuring the toxicity level of dissolved poisonous substances to fish. This rapid residual oxygen method is compared with the routine 24 or 48 hr test. The residual oxygen concentration at the time of fish death is measured either with a galvanic cell oxygen analyser probe or by titration using the oxide modification of the Winckler method. Effects of varying the densities per unit volume of test fishes, water temperature, and size of the fish were examined. A high fish density per unit volume reduces the exposure time and as a general rule toxicity is detected at higher concentrations of poison. Mercuric chloride showed no difference between the toxicity threshold at 15 deg C, 20 deg C and 25 deg C. In contrast, at 15 deg C, the toxicity for phenol is lowered to a concentration that is only one third that measured at 25 deg C. The grouping of fish according to size resulted in a reduced coefficient of variation. The test is simple and results are available in 8 hr. (Carstea-USGS)

THE USE OF A DIGITAL SIMULATION SYSTEM FOR THE MODELING AND PREDICTION OF WATER QUALITY,
R. T. Jaske.
Water Research, Vol 2, No 1, p 37-40, Jan 1968. 3 fig, 5 ref.

Descriptors: *Model studies, *Simulation analysis, *Tracers, *Thermal pollution, *Water pollution control, Water quality control, Digital computers, Dispersion, Streamflow, Dissolved oxygen, Reservoir storage, Nuclear reactors, Radioactive wastes, Density currents, Columbia River.
Identifiers: *Digital simulation, Water quality prediction.

Cooler water was released from the lower levels of Lake Roosevelt to reduce the water temperature of the Columbia River in the vicinity of Hanford nuclear plant. Manual computation of water quality became impractical because additional impoundments produced changes in circulation patterns. Therefore, a digital computer simulation system was developed using actual stream measurements for comparison. The computer program was modified to include stochastic consideration of density currents and the resulting one dimensional model had relatively good linear dispersion characteristics. Weather data were taken from Hanford station which was considered to represent a regional pattern. Simulation of conservative and nonconservative substances was included in the system. Sodium dichromate and radioactive tracers were used to simulate downstream concentrations. The model can be easily adapted to any regional system or any specific stream, and was used to study the potential thermal modification of Illinois rivers. Modeling of dissolved oxygen and reservoir storage are possible by adaption of the original program. (Carstea-USGS)

BACTERIAL AND PROTOZOAN INDICATORS OF WATER POLLUTION - STATISTICAL AND EXPERIMENTAL APPROACH,
V. Straskavoba, and M. Legner.
Water Research, Vol 2, No 1, p 8-12, Jan 1968. 7 fig, 1 tab, 7 ref.

Descriptors: *Water pollution, *Bioindicators, Protozoa, Bacteria, Biochemical oxygen demand, Bioassay, Statistical methods, Running waters, Stagnant water, Aquatic microorganisms.
Identifiers: Water pollution bioindicators.

Bacteriological methods were used to establish quantitative relationships between organisms and water pollution in running and stagnant waters. The number of bacteria estimated by membrane filter methods showed a linear relationship with the biochemical oxygen demand. There was no difference in slope of the curves between running and stagnant waters. The agar method also showed linear relationship between number of bacteria and biochemical oxygen demand for running water and sewage samples. At the same biochemical oxygen demand values, the numbers of bacteria in samples from stagnant water was lower than in those from running water. The experimental data showed good agreement with those obtained in other counties by using slightly different methods. A direct relationship was found between the prediction of ciliates and the organic load (water pollution). (Carstea-USGS)

THE WATER QUALITY PROTECTION PLAN. EFFICIENT MEANS TO ASSURE RATIONAL USE IN HYDROGRAPHIC BASINS (FRENCH),
S. Antonius.
Water Research, Vol 2, No 1, p 4-6, Jan 1968.

Descriptors: *Water quality control, *Water pollution control, *Water resources development, Water supply, Hydrography, Stream improvement, Hydrologic data, River basin development, Watershed management, Water management (Applied), Mathematical models, Model studies.
Identifiers: *Water quality model, Hydrographic basin.

A water quality protection plan includes collection of fundamental data such as water use, sources of pollution, hydrological, physical and chemical characteristics of the rivers in the basin and interpretation of collected data using a mathematical model, to establish the corrective scheme. The nature and sources of water pollution are correlated with water users and water sources. This calculation will permit the evaluation of water quality properties (BOD, suspended material, toxic substances and temperature). The water manager will be able to control the water pollution and take necessary steps to purify the polluted water. It is recommended that the water quality model should be periodically revised as to reflect the economic and social changes in the basin. (Carstea-USGS)

USE OF A SELECTIVE ION ELECTRODE FOR DETERMINATION OF NITRATE IN SOILS,
Iowa State Univ., Ames. Dept. of Agronomy.
J. M. Bremner, L. G. Bundy, and A. S. Agarwal.
Analytical Letters, Vol 1, No 13, p 837-844, 1968. 4 tab, 6 ref.

Descriptors: *Chemical analysis, *Nitrates, *Soil analysis, Nitrogen compounds, Soil chemistry, Instrumentation, Ions, Electrodes, Hydrogen ion concentration, Soil texture, Organic matter, Sulfates, Phosphates, Chlorides, Nitrites, Pollutant identification.
Identifiers: *Electrodes (Selective ion), Orion nitrate electrode, Nitrate-nitrogen, Temperature effects, Nutrient sources.

A method for precise and accurate measurement of nitrate concentration in soil extracts and soil-water suspensions with the Orion nitrate electrode is described. Techniques for preparation of soil suspensions which produced maximal nitrate-nitrogen values in all soils studies are delineated. Recoveries of known amounts of added nitrate were quantitative with soil samples which varied widely in pH, texture, and content of organic matter. No effects of pH and temperature were found in pH ranges of 5 to 8 and temperature ranges from 15-30 deg C. Use of calcium chloride (0.01 Molar) in place of distilled water in soil suspensions greatly reduced or eliminated interference by other anions, principally sulfate, dihydrogen phosphate, chloride, and nitrite, but reduced the sensitivity of the method. (Byrnes-Wisconsin)

5B. Sources of Pollution

GEOLOGY, PETROLEUM DEVELOPMENT, AND SEISMICITY OF THE SANTA BARBARA CHANNEL REGION, CALIFORNIA,
Geological Survey, Washington, D.C.
J. G. Vedder, R. F. Yerkes, T. H. McCulloh, R. M. Hamilton, and H. C. Wagner.
Geol Surv Prof Pap 679, 1969. 77 p, 5 fig, 3 plate, 77 ref, 5 append.

Descriptors: *Oil fields, *Geology, *Water pollution sources, Oil reservoirs, Stratigraphy, Oily water, Drilling, Geologic investigations, Structural geology, Faults (Geology), Land subsidence, Rock mechanics, Seismology.
Identifiers: Santa Barbara Channel Oil Field (Calif).

During normal development of an oil pool on the Rincon structural trend, about 6 1/2 miles southeast of Santa Barbara, California, a gas blowout occurred on Jan. 28, 1969. Until Feb. 7, when the well was killed by cementing, uncontrolled flow led to local oil pollution of the sea surface. Reservoir damage during this period caused moderate and steady oil seepage. This seepage, estimated to be 30 barrels per day from March through June 1969, was reduced by early September to less than 10 barrels per day by drilling and grouting. Information is presented to help provide abetter understanding of the structural geologic, stratigraphic, and seismic framework of the Channel region and of the circumstances relating to the oil seepage. In 1968, the channel area produced 22.9 million barrels of oil, about 6% of California's production. Cumulative oil production at the end of 1968 was about 1.1 billion barrels, or about 7 1/2% of California's total production. Dry gas production in 1968 was about 12% of the State production. The large production of the Rincon trend fields is attributable to thick, oil-saturated sections and relatively high porosities and permeabilities. The Santa Barbara Channel region is seismically active: since 1900 it has experienced two earthquakes of magnitude 6, and in 1812 it was the site of a shock that may have attained magnitude 7. MOVEMENT OF DDT AND NITRATES DURING GROUND-WATER RECHARGE,
Robert S. Kerr Water Research Center, Ada, Okla.
Marion R. Scalf, William J. Dunlap, Leslie G. McMillion, and Jack W. Keeley.
Water Resources Res, Vol 5, No 5, p 1041-1051, Oct 1969. 12 p, 10 fig, 1 tab, 19 ref.

Descriptors: *Path of pollutants, *Groundwater movement, *DDT, *Nitrates, *Tracking techniques, Tracers, Water wells, Pumping, Recharge, Discharge (Water), Adsorption, Dispersion.
Identifiers: Aquifer tests, Pumping tests, Ogallala aquifer.

The Robert S. Kerr Water Research Center, U. S. Department of the Interior, and Southwestern Great Plains Research Center, U. S. Department of Agriculture, recently cooperated in a field investigation of the fate of DDT and nitrates when artificially recharged into the Ogallala aquifer. The USDA provided recharge and observation wells and hydraulic equipment for injecting 350 gpm of water with known concentrations of radioactive tracer, DDT, and nitrates. Following 10 days of recharge, the recharge well was pumped for 12 days at 500 gpm. During recharge the nitrates moved to the observation wells essentially at the same rate as the recharge water, and the DDT was absorbed to the aquifer material very near the recharge well. During the pumping phase, 94% of both the recharge water and the nitrates was recovered. The concentration of DDT in the pumped water was about 16 times the recharged concentration at initiation of pumping but dropped below recharge concentration within one hour. Apparently a major portion of the DDT introduced during recharge was not recovered during pumping but remained in the aquifer. (Knapp-USGS)

SOME THERMAL CHARACTERISTICS OF TWO RIVERS IN THE PENNINE AREA OF NORTHERN ENGLAND,
Durham Univ. (England). Dept. of Geography.
K. Smith.
Journal of Hydrology, Vol 6, No 4, p 405-416, Aug 1968. 6 fig, 4 tab, 18 ref.

Descriptors: *Air temperature, *Water temperature, Air-water interfaces, Thermal stratification.
Identifiers: Air-water temperature relationship, Northern England.

This paper examines water temperature data obtained over a 4 year period (1958-1961) for two adjacent rivers in northern England. The thermal regime is compared at upstream and downstream sites on each river, and the relationships between river water and air temperatures are also discussed. It is emphasized that a satisfactory explanation of the variations revealed is only possible through a consideration of both climatological and hydrological factors. (Guerrero-Vanderbilt)

PHYSICAL MODELING OF REGIME OF BODIES OF WATER TO STUDY THEIR SANITATION CONDITION (IN RUSSIAN),
State Hydrological Inst., Leningrad (USSR).
V. A. Znamenskyi.
Nauchnyie doklady po voprosam samootshchishchena vodoyemov i smeshchenia stochnych vod, p 188-199, Tall Pol Inst, Tallinn ESSR, 1965.

Descriptors: *Model studies, *Mathematical models, Hydraulical models, Hydraulic similitude, Turbulence, Water quality, Reynolds number, Froude number, Waves, Thermal properties, Tidal effects.

The most effective way of solving the problem of either hydrodynamic behavior of bodies of water or dilution processes in them is a combination of theoretical computations with physical modeling. This paper deals mainly with the mathematical modeling of hydrodynamic behavior of estuaries and takes into account the effects of wind and tidal wave propagation. The difference of discharges coming into the body of water and going out is expressed as delta Q= Sxu, where S is the surface area and u is the velocity of change in depth. According to measurements in the Neva estuary near Leningrad, this discharge difference can be 10-20 times higher than the inflow rate. The influence of temperature and thus the density distribution is also discussed. The space modeling which is described must take into account the gravity, inertial and viscosity forces. Dye and salt were used as a representation of pollution in these space models. It is concluded that the use of space models yields solutions to many problems of water quality behavior in the receiving waters. (Novotny-Vanderbilt)

THE RELATION OF ION MOVEMENT TO FINE PARTICLE DISPLACEMENT IN A SAND BED,
Georgia Inst. of Tech., Atlanta.
Jerry B. F. Champlin.
Available from the Clearinghouse as PB-187 521, $3.00 in paper copy, $0.65 in microfiche. Water Resources Center, Georgia Institute of Technology, WRC-0369, July 1969. 22 p. OWRR Proj A-002-GA.

Descriptors: *Ion transport, *Radioactive tracers, *Ion movement, *Ion adsorption, *Porous media, *Sand filters, Radioisotopes, Ion exchange, Trace elements, Aquifers, Radioactivity, Radioactive waste disposal, Water purification, Water quality.
Identifiers: Scandium, Rubidium, Lanthanum.

Determination of the fundamental mechanisms by which trace metals and organic compounds are fixed or immobilized by the soil and sediments of the earth from water moving through aquifers is the research objective. Dilute water suspensions (model wastes) were passed through packed sands (model soils), forming a horizontal simulated aquifer 2 meters long, 1 meter wide and 1/4 meter thick. Retention of radioactivity added to water, to suspended clay, and to suspended bacteria by the sand bed was investigated, using radioisotopes of rubidium, lanthanum and scandium. In general, some of the radioactivity originally in solution transferred to fines derived from the sand bed and passed through into the effluent. A significant portion of the radioactivity initially placed on the clay also passed through the sand bed. None of the radioactivity added to the bacteria passed through the sand bed into the effluent. The research established that significant movement of ionic matter through porous beds of soils can take place in the form of dilute suspensions at low salt concentrations; and that direct transfer to free ions through packed beds at low dissolved salt concentrations is unlikely. (Conway-Georgia Tech)

TEMPORAL, HORIZONTAL AND VERTICAL VARIABILITY OF WATER CHEMISTRY IN UNSATURATED ZONE OF FINE-GRAINED SOILS,
Idaho Univ., Moscow. Water Resources Research Inst.
Roy E. Williams.
Available from the Clearinghouse as PB 187 523, $3.00 in paper copy, $0.65 in microfiche. Research Technical Completion Report, Idaho Water Resouces Research Institute. June 1969. 31 p. 3 tab, 3 fig, 3 ref. OWRR Proj A-021-IDA.

Descriptors: Soil chemistry, Soil analysis, Soil chemical properties, *Soil moisture meter, *Infiltration, *Ion transport, *Water pollution sources.

A method was developed for extracting water samples from unsaturated soils under low moisture content and concomitant high tension. A sample collection cell was constructed by enclosing a hydrophylic, cross-linked, dextran xerogel in seamless, dialyzer tubing with opening diameters of 48 angstroms. When the cell is placed in contact with a soil, water and its dissolved ions move through the membrane and into the hydrophylic substance. Because the ion exchange capacity of the xerogel is negligible, the water and ions can be replaced by distilled, deionized water and the effluent analyzed. However, chemical analysis of the effluent has revealed that results are not reproducible and that unreasonably high concentrations of some ions often result. Combination tracer and infiltration tests have demonstrated that water moves through the loess soils of northern Idaho via discontinuities as well as through intergranular pore spaces. Whether the discontinuities are operative in the infiltration process depends on the surface condition and on the application rate. These must permit a saturated layer to form above the discontinuities before they can begin to water preferentially. (Corey-University of Idaho)

CALCULATION OF WATER POLLUTION BY SURFACE RUNOFF,
N. A. Pravoshinsky, and P. D. Gatillo.
Water Research, Vol 2, No 1, p 24-26 Jan 1968.

Descriptors: *Water pollution sources, *Water quality, *Surface runoff, *Water pollution control, Pollutants, Water properties, Oil, Snowmelt, Sewage, Biochemical oxygen demand, Statistical methods, Suspended load, Chlorides, Coliforms.
Identifiers: *Urban runoff, *USSR, Minsk, Soligorsk, Street washings.

Water pollution by surface runoff was studied (1964) in two districts of Minsk and in 1966 from the Soligorsk area. The main index of pollution was the 5-day BOD. Suspended solids, chlorides, oil products and coliform counts were also determined. Water from asphalt surfaces was more polluted than the water from unpaved areas. The amount of pollutants in runoff water was about 13% of the amount measured in raw domestic sewage. Statistically analyzed data show a relationship between water quality and stream flow. The stream character, duration of the preceeding dry weather period, seasonal variation, and the type of surface were also condensed in the interpretation and application of data. The study are was divided into sections based primarily on hydraulic properties and the way pollutants reach the water course. The concentration of pollutants, their rate of purification, total BOD, oxygen concentration, amount of suspended solids and number of bacteria revealed differences between rivers and ponds. THE PREDICTION OF THE DISTRIBUTION OF DISSOLVED OXYGEN IN RIVERS,
M. Owens, and G. Knowles.
Water Research, Vol 2, No 1, p 20-21, Jan 1968. 2 p.

Descriptors: *Dissolved oxygen, *Mathematical models, *Mixing, *Diffusion, *Tracers, Analytical techniques, Aeration, Water management (Applied), Rivers, Water temperature, Solar radiation, Streamflow, Aquatic plants.
Identifiers: Dissolved oxygen prediction, River management.

A simple mathematical model is given to be used for predicting the changes in oxygen content in rivers. The basic processes responsible for changes in oxygen content are matematically expressed using river flow, surface area between two stations and the oxygen concentrations at the stations. A series of empirical relations was developed to describe the influence of environmental conditions upon the dissolved oxygen content. Water temperature, intensity of solar radiation and average biomass of aquatic plants were used in predicting the oxygen content. Calculated and observed dissolved oxygen distributions were in fairly good agreement in unpolluted streams. The mixing coefficients derived by tracer techniques were introduced in the refined mathematical model. The potential applications of the model in water management is also discussed in the paper. Preliminary observations on exudation from Fucus vesiculosus confirm the importance of this process in ecology of inshore waters. Algae, maintained in the laboratory for 24 hours, exuded 500-800 milligrams of phenolic, and 1.0-1.5 grams of carbohydrate materials per kilogram dry weight of Fucus. Qualitative studies on standing exudates from three important Norwegian seaweeds show that exudates form humic substances (Gelbstoff) inseparable from that present in seawater. Observations based on paper chromatography, dialysis, Sephadex fractionation and recombination of fractions led to elaboration of a hypothesis for Gelbstoff formation from algal exudates. Brown seaweeds exude a few simple, potentially phenolic precursors; these form polyphenols in alkaline seawater which rapidly react with proteinaceous and carbohydrate material, the resulting complexes constituting a considerable part of marine Gelbstoff. The larger molecular complexes of Gelbstoff are continually precipitating to form organic aggregates. Similar transformations of phenolic precursors to soluble Gelbstoff complexes and the subsequent formation of colored precipitates take place in bog water and in sulphate effluents. Common mechanisms, involving simple phenols, proteinaceous, and carbohydrate matter, may result in formation of terrestrial and marine Gelbstoff. (Jones-Wisconsin)

Identifiers: *Algal substances, *Extracellular, Fucus vesiculosus, Chondrus crispus, Ascophyllum nodosum, Laminaria digitata, Laminaria agardhii, Desiccation, Immersion, Narragansett Marine Laboratory (Rhode Island), Dilution rate, Fruiting bodies, Ulva lactuca var latissima, Polysiphonia harveyi, Epiphytic bacteria, Sublittoral, Yellow material, Dumontia incrassata, Emersion.

Sunlit and darkened Fucus vesiculosus accumulate no dissolved organic matter in closed systems, in which problem of bacterial growth was not entirely overcome. Open systems, with seawater dilutions, consistently accumulated appreciable quantities of extracellular organic carbon. Exudation in Fucus, coupled directly with photosynthesis, increased with solar radiation. Two Laminaria produced exudation in the dark. Reducing salinity of seawater apparently diminished organic matter exudation rate by Fucus. Organic carbon is lost upon re-immersion of dissicated Fucus in seawater. Algal clumps on exposed rocks lost some 39 milligrams carbon/100 grams. Light natural rainfall more effectively extracts organic carbon than artificial rainfall. Nature of exudates, determined by colorometric assay, revealed that carbohydrates are most abundant, followed by equal amounts of nitrogenuous and polyphenolic material. During spring conditions, Fucus exudes approximately 30% of total or 40% of net carbon fixed daily. Since biomass of carbon in Fucus beds can exceed 1000 grams/square meter and algae minimally fix 6.5 grams/square meter/day, Fucus exudation of organic matter equal 5-7 grams carbon/square meter/day. (Jones-Wisconsin)

STUDIES ON ALGAL SUBSTANCES IN THE SEA. I. GELBSTOFF (HUMIC MATERIAL) IN TERRESTRIAL AND MARINE WATERS,
Norwegian Inst. of Seaweed Research, Trondheim.
John McN Sieburth, and Arne Jensen.
J Experimental Marine Biology and Ecology, Vol 2, p 174-189, 1968. 8 fig, 1 tab, 24 ref.

Descriptors: *Oceans, *Marine algae, *Seawater, *Fresh water, *Humic acids, *Color, Rivers, Bogs, Phenols, Pigments, Organic matter, Biomass, Benthic flora, Phaeophyta, Polar regions, Spectrophotometry, Chromatography, Hydrogen ion concentration, Fluorescence, Carbohydrates, Temperature, Salinity, Ultraviolet radiation, Sulfates, Cellulose, Industries, Water pollution sources.
Identifiers: *Gelbstoff, *Algal substances, Subpolar waters, Tynset (Norway), Nid River (Norway), Gaula River (Norway), Flakk (Norway), Ranheim (Norway), Trondheimsfjord (Norway), Smola (Norway), Hitra (Norway), Froya (Norway), Fucus vesciculosus, Ascophyllum nodosum, Ectocarpus confervoides, Nylon column technique, Particulate matter, Blue fluorescing material, Yellow material, Fractionation.

Dissolved yellow colouring matter of terrestrial and marine waters was concentrated in nylon columns. A concentration factor of 10,000 was obtained with a recovery of approximately 70%. The method allowed isolation of a reference 'Gelbstoff' of marine origin used to estimate Gelbstoff concentrations in bog (17 milligrams/liter (mg/l)), river (about 1 mg/l), and sea water (0.003-0.8 mg/l). Seasonal and geographical variation of Gelbstoff concentration in sea water was observed. Methods based on spectra and differential spectra were inadequate for characterization of different types of yellow material from terrestrial and sea water; they are apparently derived from polyphenols. Fair separation of Gelbstoff was effected from different sources by a method of two-dimensional paper chromatography, which they developed. Marine Gelbstoff could be distinguished from both river and bog water pigments. A considerable fraction of terrestrial Gelbstoff precipitated rapidly in contact with sea water. Content and characteristics of marine Gelbstoff are variable, and is undetectable during January, February, and March. Part of the yellow color of sea water is due to particulate organic matter, which is largely amorphous and shows polyphenol staining. Precipitating Gelbstoff may be a major source of these organic aggregates. (Jones-Wisconsin)

ABOUT THE QUESTION OF VERTICAL MIXING OF WASTE WATERS IN CLOSED RESERVOIRS (In Russian),
A. M. Aitsam, L. L. Paal, and H. A. Tibar.
Sbornik statei po sanitarnoi tekhnike III, Trudy talinskogo politekhnicheskogo instituta, seria A, No 233, p 99-107, 1966.

Descriptors: *Mixing, Reservoirs, Mathematical models, Water pollution, Laplace's equations, Wave lengths, Waste dilution.

The problem of vertical mixing caused by wave formation is theoretically solved. This vertical mixing is dependent on the coordinates (x,y,z), on the reservoir depth, h, and on the characteristics of the wave (height, length, and period). To obtain the velocity potential, integration of Laplace's equations is necessary. Using the Lagrange integral the following equation was obtained involving the coordinate of the free surface, Z (B)= f (x,y,t). In order to solve this equation it was assumed that the height of the wave is relatively small in comparison with its length. Fourier's method was used to find the velocity potential Phi. Vertical mixing in reservoirs is caused by the vertical component of the velocity, V (2). Using a derived equation, the vertical flow of liquid through an elemental area dw= lxdx can be computed and the total mass flow of liquid was found by integration. The validity of the equations obtained was verified in a laboratory flume where a dye was used for modeling of pollution. The paper is an attempt to estimate the influence of waves on the mixing of waste waters in closed reservoirs. (Novotny-Vanderbilt)

SWEETWATER POLLUTION,
Larry Paul Wasserman.
Sci and Tech, No 90, p 20-27, June 1969. 8 p.

Descriptors: *Water conservation, *Water pollution, *Pollution abatement, *Fresh water, Wastes, Waste water treatment, Water pollution effects, Waterfowl, Pollutants, Radioactive wastes, Water pollution treatment, Water quality, Water resources, Fish and wildlife, Thermal pollution, Ecology, Marshes, Eutrophication, Aquatic life, Estuaries.
Identifiers: Pollution control, Biological magnification.

The earth's fresh water supply is not a constant, and is being reduced by man's wanton use. The problem arises from pollution and wasted water and from insidious circumstances resulting from such activities as land filling along shorelines and marshes. Pollution problems from sewage, industrial wastes, agricultural chemicals, and eutrophication are reviewed. Landfills of marshes, estuaries, or river shores produce adverse ecological changes, destroying valuable breeding grounds for many forms of aquatic life, waterfowl, and other wildlife. Radioactive materials released in even minute quantities present a great hazard because the radioactive material can become progressively concentrated to dangerous levels in various forms of animal life. Thermal pollution, sedimentation, and salt water intrusion problems are discussed. Current approaches to pollution problems are merely stopgap approaches. The principal ingredient needed to counteract the growing water pollution dilemma is money--money to run a conservation organization, to preserve and set aside lands, to run treatment plants, and to coordinate plans on national and state levels. CITY AIR - BETTER OR WORSE,
Public Health Service, Washington, D.C.
H. E. Landsberg.
SEC Technical Report A 62-5, Symposium, Air Over Cities, Cincinnati, Ohio, Nov 1969. 22 p, 3 fig, 4 tab, 65 ref.

Descriptors: *Temperature, *Climates, *Air pollution, Wind velocity, Precipitation.
Identifiers: *Human activities, Public hygiene.

Extreme human activity has caused considerable changes in local climates. These modifications in big cities in turn have increased the temperature by 1 to 1.5 deg F on an annual basis, diminished diurnal temperature range, flattened the shape of diurnal temperature curve, decreased the relative hu-

midity by 6%, increased the amount of precipitation by 10%, and decreased the speed of winds by 20 to 30%. In addition dust particles have increased by 10 fold, SO2 by 5 fold, CO2 by 10 fold, and CO by 25 fold. Radiation has decreased by 15 to 20% and ultra-violet radiation in the winter is 30% less. There is 100% more fog in the winter and 10% more clouds. These effects have probably only a minor influence upon human well-being. Other changes, however, have potentially harmful effects. The most radical effect has been on atmospheric suspensions and admixtures. None of these changes have been beneficial. The growth of nearly all urban areas and industrial complexes has outpaced the engineering and legal efforts to minimize the nuisance and the possible danger of contamination. Our knowledge of air quality and its effects on health is not yet adequate. In the interest of public hygiene, an intense effort in bio-meteorological and medical research is required. (Upadhyaya-Vanderbilt)

THE THERMAL CLIMATE OF CITIES,
Public Health Service, Washington, D.C.
J. M. Mitchell, Jr.
SEC Technical Report A62-5, Symposium, Air Over Cities, Cincinnati, Ohio, Nov 1969. 15 p, 9 fig, 2 tab.

Descriptors: *Air temperature, *Solar radiation, *Urban areas, Population, Cloud cover, Wind velocity, Lapse rate, Turbulent mixing.
Identifiers: *Urban heat island, Nocturnal inversions.

The urban 'heat island' and other aspects of the anomalous temperature distribution in San Francisco, San Jose, Palo Alto, New Haven, Vienna and a number of other cities are discussed. Heat island of a city is weaker on Sundays, when the city is comparatively dormant, than on other days of the week, when it is bustling with activity which indicates that these islands are man-made. As the city grows in size and population the increase of the intensity of urban heat island has been observed. The urban heat island is most evident at night. Daily maxima and minima of temperature are reached slightly later in the city than in suburbs, and the daily range is less in the city. The contributory causes of heat island are, on a summer day, solar radiation is more readily absorbed in the city by building and paving materials possessing large heat storage capacities, and on a winter day, the streets and buildings are warmed by the furnace heat. Sundborg found that the nighttime urban-rural temperature difference, D, could be approximated by D= (a - bN)/V where N is % cloud cover, V is wind speed, a and b are constants. THE DIURETIC RESPONSE BY RAINBOW TROUT TO SUB-LETHAL CONCENTRATIONS OF AMMONIA,
Ministry of Agriculture, Fisheries and Food, London (England). Salmon and Freshwater Fisheries Lab.
R. Lloyd, and L. D. Orr.
Water Research, Vol 3, No 5, p 335-344, May 1969. 10 p, 6 fig, 19 ref.

Descriptors: *Ammonia, *Rainbow trout, *Toxicity, Lethal limit, Streams, Estuaries, Fish, Water properties, Fish management, Water temperature, Dissolved oxygen, Carbon dioxide, Alkalinity, Water quality.
Identifiers: *Diuretics, Ammonia toxicity.

Ammonia is one of the most common pollutants in rivers and estuaries. The degree of ammonia toxicity is dependent upon pH, water temperature, bicarbonate alkalinity, dissolved oxygen, carbon dioxide. The diuretic affects of ammonia on rainbow trout were studied in relation to effect of ammonia concentration, the time-lag in diuretic response, effect of temperature, and acclimation to sub-lethal concentrations of ammonia. The rate of urine excretion by rainbow trout increases with increase in the concentration of ammonia probably because of the increase in the permeability of fish to water. It is suggested that any environmental factor which affects the water balance of fish may also influence their susceptibility to ammonia poisoning. (Carstea-USGS)

WATER QUALITY CRITERIA FOR EUROPEAN FRESHWATER FISH - WATER TEMPERATURE AND INLAND FISHERIES.
European Inland Fisheries Advisory Commission. Working Party on Water Quality Criteria for European Freshwater Fish.

Water Research, Vol 3, p 645-662, 1969. 3 tab, 103 ref.

Descriptors: *Freshwater fish, *Temperature, *Effects, *Standards, Heated water, Fish food organisms, Acclimatization, Lethal limit.

In this report, tentative temperature criteria are proposed for European inland fisheries. No account is taken of the effect of pollution. It was essential to make a distinction between the temperature conditions permissible at different times of the year and to assess not only maximum permissible temperatures but also maximum permissible increments of temperature. Winter--An increase in water temperature of 2 deg C from about 0 deg C in winter at the time of reproduction of burbot would destroy this species. Raising the temperature 5-6 deg C in autumn and winter may affect salmonids. Spring--A rise of 5-6 deg C is detrimental to pike embryos. The majority of cyprinids tolerate an increase of temperature of 8-10 deg C during the embryonic stage. Adult fish can usually tolerate a wider range of temperature than embryos. It seems likely that if water temperature gets near the disturbing level most species would continue to feed. Summer--For salmonids of the genus Salmo, 20-21 deg C should be accepted as the upper permissible temperature during the warmest season of the year. Coregonids can withstand a rise of temperature of 5-6 deg C but the maximum for the summer months should not exceed 22-23 deg C. For many cyprinids, the permissible increase of temperature is about 6 deg C above the natural ambient values, with an upper limit of 30 deg C during the warmest season. (Speakman-Vanderbilt)

WASTEWATER DISPOSAL AND MICROBIAL ACTIVITY AT ICE-CAP FACILITIES,
Army Terrestrial Sciences Center, Hanover, N.H.
S. C. Reed, and W. Tobiasson.
Journal, Water Pollution Control Federation, Vol 40, No 12, p 2013-2020, Dec 1968. 6 fig, 1 tab, 5 ref.

Descriptors: *Ice, *Snow, *Sewage disposal, Anaerobic digestion.
Identifiers: *Thermal degradation, Greenland, *Icecap.

The physical development of the wastewater disposal pits used at two permanent stations on the Greenland Ice Cap was defined with temperature sensing themocouples and a sonic range finding device. Physical measurements indicate that the disposal pit contained within the snow mass of the ice cap grows to a diameter of 220 ft. Thermal degradation of the snow mass by this pit will have detrimental settlement effects on any facility located within 300 feet of the outfall point. Temperature of the liquid in the pit remained a constant 32 deg F. Hydrogen sulfide production was measured in the pit but methane was not detected; this indicates that at least a preliminary stage of an aerobic decomposition is occurring. (Rietveld-Vanderbilt)

MATHEMATICAL SIMULATION OF THE ESTUARINE BEHAVIOR AND ITS APPLICATIONS,
General Electric Co., Philadelphia; and Federal Water Pollution Control Administration, Philadelphia, Pa.
J. M. Jeglic, and G. D. Pence.
Soc Econ Planning Sci, Vol 1, No 3, p 363-389, July 1968. 27 p, 19 fig, 8 ref.

Descriptors: *Simulation analysis, *Estuarine environment, *Mathematical models, *Water quality control, *Optimization tidal waters, Forecasting, Delaware River, Dispersion, Advection, Droughts, Dissolved oxygen.

The cause and effect relationships as applied to important water quality parameters were described. Presented were the steps in the development of a mathematical model representing the dispersion and advection of dissolved oxygen in a one dimensional tidal environment, using mass balances on finite volumes. The goal of the study was to develop a rational means of estimating the cause and effect relationships, so that accurate forecasts of the results of proposed control systems could be obtained and assurances could be made that a control program had a reasonable chance of success. The verification of the model was made using a year of actual data on the Delaware estuary. During the 1965 draught the salt water intrusion in the Delaware was examined on a thirty-day basis so that corrective measures could be taken. The mathematical model presented proved to be a valuable tool in the analysis of estuarine behavior. (Thiuri-Cornell)

STRONTIUM-90 CONCENTRATION FACTORS OF LAKE PLANKTON, MACROPHYTES, AND SUBSTRATES,
Akademiya Nauk URSR. Inst. of Biology of the Southern Seas.
Z. Kalnina, and G. Polikarpov.
Science, Vol 164, No 3887, p 1517-1519, June 1969. 3 p, 4 tab, 12 ref.

Descriptors: *Water chemistry, *Eutrophication, *Strontium radioisotopes, Sediment, Plankton,

Aquatic life, Water pollution sources, Water pollution effects, Flame photometry, Nuclear wastes.
Identifiers: *USSR, *Latvia.

The ratio of concentration of strontium-90 in living and inert lake components to that in lake water (concentration factors) was determined for plankton, macrophytes, and substrates in eutrophic, mesotrophic-eutrophic, and dystrophic lakes. Concentration factors of strontium-90 in aquatic organisms and substrates are higher in a dystrophic lake than in the other types. (Knapp-USGS)

PHYSICAL AND BIOCHEMICAL ASPECTS OF BOD KINETICS,
Technische Hochschule, Karlsruhe (West Germany). Lehrgebiet fur Ingieurbiologie.
Ludwig Hartmann, and Peter Wilderer.
Water Research, Vol 2, No 1, p 30-37, Jan 1968. 10 fig, 7 ref, 2 append.

Descriptors: *Biochemical oxygen demand, Biodegradation, *Water pollution effects, Activated sludge, Organic loading, Physical properties, Diffusion, Pollutants, Chemical reactions, Turbulence.
Identifiers: *Biochemical reaction kinetics, Reaction rates.

Two main theoretical concepts are generally accepted to describe the BOD process: (1) Biochemical concept considers that biochemical reactions within the cell are responsible for the reaction rates; (2) physical concept emphasizes convection and diffusion processes during the transport of organic pollutants to and through the living cell. A set of experiments used biochemical methods to evaluate and describe BOD kinetics. A constant substrate concentration was brought into contact with various amounts of activated sludge. It was impossible to use one mathematical formula to describe the whole BOD process. Second order reactions were the best approximation to evaluate the process at low load values. In this case, turbulence and other physical factors had a positive influence upon the process. Biochemical reactions were responsible for the rate of BOD reaction only at high load values. STUDIES ON NATURAL FACTORS AFFECTING PHOSPHATE ABSORPTION AND ITS UTILIZATION BY ALGAE,
Joseph Shapiro.
Water Research, Vol 2, No 1, p 21-23, Jan 1968. 2 fig, 3 ref.

Descriptors: *Eutrophication, *Nutrients, *Water pollution sources, *Phosphates, Algae, Water pollution treatment, Water quality control, Sewage effluents, Absorption, Lakes.
Identifiers: *Phosphate absorption.

The accumulation of nutrient elements in water, particularly nitrogen and phosphorus, favors the process of eutrophication. Previous experiments have shown that different factors are present in natural waters which inhibit or facilitate the use of phosphate by algae. The 'phosphate sparing factor' was studied by using lake water and microcystis aeruginosa as the test organism. Ion exchange resins were used to determine an ionic factor that facilitated the use of phosphate by microcystis. Addition of salts increased the rates of phosphate uptake by the algae in diluted lakes; however, nitrate seemed to be the most important factor. More experimental work using different algae and chemical components are in progress. (Carstea-USGS)
W70-01031

AVOIDANCE REACTIONS OF SALMONID FISH TO REPRESENTATIVE POLLUTANTS,
John B. Sprague.
Water Research, Vol 2, No 1, p 23-24, Jan 1968.

Descriptors: *Water pollution effects, *Pollutants, Limnology, Rainbow trout, Phenols, Chlorine, Detergents, Sewage effluents, Pesticide toxicity, Toxicity, Atlantic salmon.
Identifiers: *Avoidance reactions, Salmonid fish.

Small rainbow trout or Atlantic salmon were used in laboratory experiments to test avoidance reactions against zince sulfate, phenol, ABS detergent, chlorine and bleached Kraft pulp mill effluent. Strong avoidance reaction to sublethal concentration occurred only for one (zinc sulfate) of the five pollutants used. Phenol is not avoided at all, whereas chlorine and ABS detergent could cause avoidance responses at concentrations that are expected in polluted waters. The avoidance threshold of Atlantic salmon for metal pollution was found to be about 18 times higher in nature than in laboratory tests. The salmonid fishes have different responses for different kinds of pollution depending upon the characteristics inherited from their natural habitats. (Carstea-USGS)
W70-01032

ON THE DIFFUSION PHENOMENA IN BOUNDARY LAYERS OF TURBULENT FLOW AND ITS INFLUENCE ON THE COURSE OF THE SELF-PURIFICATION OF SMALL STREAMS,
V. Novotny.
Water Research, Vol 2, No 1, p 6-8, Jan 1968.

Descriptors: *Diffusion, *Self-purification, Dissolved oxygen, Mass transfer, Turbulent flow, Oxygenation, Biochemical oxygen demand, Turbulent boundary layers, Rivers.
Identifiers: *Self-purification (Rivers).

The rate of self-purification of water is dependent upon the ratio of the bottom organisms to the river flow. The quantity of nutrients which diffuse from the free water surface to the bottom is a determining factor for the biological activity of benthic organisms. Diffusion phenomena and mass transfer of water are described mathematically. In addition to turbulent flow, a diffusive boundary layer should be considered when dealing with diffusion phenomena. A mathematical approach was applied to calculate the deoxygenation coefficient by using data from streams rich in bottom growths. Control of BOD in streams is possible if the hydraulic conditions of the stream are known. (Carstea-USGS)

THE INFLUENCE OF ALGAL ANTIBIOSIS ON THE ECOLOGY OF MARINE MICROORGANISMS,
Rhode Island Univ., Kingston. Narragansett Marine Lab.
John McNeill Sieburth.
Advances in Microbiology of the Sea, Academic Press, New York, Vol 1, p 63-94, 1968. 8 fig, 122 ref.

Descriptors: *Algae, *Ecology, *Marine microorganisms, Phytoplankton, Bactericides, Algal toxins, Larvae, Phenols, Shellfish, Oysters, Industries, Chelation, Bacteria, Streptococcus, Secondary productivity, Sulfides, Sea water, Phawophyta, Crustaceans, Herbivores, Chlorophyll, Enzumes, Peptides, Biochemistry, Hydrogen ion concentration, Oxidation, Diatoms, Epiphytology, Metabolism, Primary productivity, Fluorescence, Isotropy, Tritium, Symbiosis, Temperature, Copepods, Protozoa, Zooplankton, Solar radiation, Pseudomonas, Parasitism, Physiological ecology, Water pollution sources, Water pollution effects.
Identifiers: *Antibiosis, Autolysis, Excretion, Depuration, Phycocolloids, Tannins, Flagellates, Pharmaceuticals, Extracellular products, Chemical resistance, Euphausia, Phaeocystis, Sargassum, Fronds, Hydrocarbons, Bacterial attachment, Ecotocarpus, Polysiphonia, Organic aggregates, Seasonal effects.

Author reviews the role in marine ecology of antibiosis resulting from excretion of substances secondarily excreted by algae, a subject contributing to the much larger picture of microbial interactions. Photosynthetic plants are primarily important to heterotrophic microbiota as providers of primary nutritional substances. Conversely, heterotrophic bacteria may markedly influence the nutrition and success of marine plants, presumably resulting from modification of excreted and autolytic products by depolymerization and mineralization into usable nutrients, production of growth and morphogenetic factors for algae, and by detoxification of inhibitory substances. When possible, such processes should be studied in concert, rather than separately. Realization that algal products may benefit, modify, and even suppress early life stages of marine animals reemphasizes the importance of interdisciplinary attacks on ecology. Field studies promise to demonstrate factors which influence suppression, selection, dominance, and succession of marine microorganisms. Any such studies must include consideration of effects of extracellular secretions. Author summarizes his knowledge and understanding of the nature and influence of inhibitory secondary plant materials in marine environments to encourage continued investigation of algal antibiosis. NITROGEN FIXATION BY GLOEOCAPSA,
North Texas State Univ., Denton. Water Research Lab.
J. T. Wyatt, and J. K. G. Silvey.
Science, Vol 165, p 908-909, Aug 1969. 1 tab, 18 ref. FWPCA Grants WP-00805-04, WP-00985-04.

Descriptors: *Cyanophyta, *Nitrogen fixation, Reduction (Chemical), Chromatography, Optical properties, Bacteria, Nitrogen cycle, Water pollution effects, Eutrophication, Cycling nutrients.
Identifiers: *Gloeocapsa, Ethylene production, Acetylene reduction, Phormidium faveolarum, Heterocyst, Chroococcus, Cylindrospermum, Nostoc muscorum, Nostoc commune, Tolypothrix distorta, Nutrient sources.

Continuous growth of the cyanophyte (blue-green alga) Gloeocapsa, in a medium free of combined nitrogen, with experimental production of ethylene via acetylene reduction, indicates that nitrogen fixation by cyanophytes is not solely confined to filamentous genera with heterocysts. Axenic cultures of Gloeocapsa, adapted to nitrate-free medium, form ethylene at rates comparable to those of known nitrogen-fixers. Special control measures precluded the possibility of responses being falsely attributed to Gloeocapsa. Authors also tested uninoculated gassed samples and cultures of Phormidium faveolarum, a non-nitrogen-fixer. Because earlier work indicated that no appreciable nitrogen fixation occurred in cyanophytes after prolonged exposure to darkness, authors adopted an arbitrary pretreatment period of 8 hours in darkness before incubation in dark-bottle and light controls. Thus, the ability of Gloeocapsa to reduce acetylene would suggest that heterocysts are not the site of nitrogen fixation, at least for this species of cyanophyte. This ability plus the facts that Gloeocapsa maintained both its vigor and an apparent normal growth rate over a period of 9 months in a medium free of combined nitrogen should establish it as a nitrogen-fixer. (Jones-Wisconsin)

FACTORS AFFECTING THE GROWTH OF NAJAS IN PICKWICK RESERVOIR,
National Fertilizer Development Center, Muscle Shoals, Ala.
J. B. Martin, Jr., B. N. Bradford, and H. G. Kennedy.
National Fertilizer Development Center, Tennessee Valley Authority, Muscle Shoals, Alabama, Doc No F 70 ACD2, Oct. 1969. 19 fig, 18 tab, 8 ref, appendix.

Descriptors: *Plant growth, *Nutrient requirements, Carbon, Photosynthesis, Seeds, Sediments, Turbidity, Waves (Water), Eutrophication, Tennessee River, Industrial wastes, Municipal wastes, Nutrients, Sand, Potassium, Calcium, Magnesium, Sulfur, Alabama, Silts, Clay loam, Hydrogen ion concentration, Particle size, Iron, Copper, Manganese, Sodium, Alkalinity, Aeration, Springs, Streams, Quarries, Reservoirs, Light intensity, Tennessee, Tennessee Valley Authority Project, Sampling, Agricultural chemicals, Water pollution effects, Water pollution sources, Aquatic weeds, Bicarbonates, Carbonates, Environmental effects, Nitrates, Phosphates, Rooted aquatic plants, Sediment yield, Water quality.
Identifiers: *Najas minor, *Najas quadalupensis, *Pickwick Reservoir (Tenn-Ala), Zinc, Wilson Dam (Ala).

Authors investigated nutritional and environmental factors concerning recent infestations of Najas spp in Pickwick Reservoir (Tennessee-Alabama). Degree of infestation in any location could not be related to variations in the nutrient content of the reservoir water. Najas growth in the greenhouse was independent of nitrogen and phosphorus concentration of water, but was positively correlated with the bicarbonate ion content, the plants' source of carbon for photosynthesis via leaves and stems. Lake sediments supply inorganic nutrients via the plants' relatively weak root system. Plants rooted in a nutrient-free sand could not sustain growth, although submerged in a nutrient solution. However, variations in nutrient content of the lake sediments were apparently not responsible for presence or absence of Najas in any specific spot. That both sediments and water contribute essential factor (s) for Najas' growth is indicated by observations that plants grew normally rooted in sediment and immersed in reservoir water, whereas growth failed in similar plants immersed in demineralized water. Water depth, sediment load, turbidity, light penetration, seed introduction, wave action, and other environmental factors were cited as the controlling factors in distribution of Najas. Report includes appendix outlining analytical techniques and methods for greenhouse culture of Najas. (Jones and Nichols-Wisconsin)

IMPLICATION OF WATER QUALITY AND SALINITY IN THE SURVIVAL OF FRASER RIVER SOCKEYE SMOLTS,
International Pacific Salmon Fisheries Commission, New Westminster (British Columbia).
I. V. Williams.
International Pacific Salmon Fisheries Commission Progress Report, No 22, 1969. 8 fig, 15 tab, 25 ref.

Descriptors: *Sockeye salmon, *Herbicides, *Pesticides, *Salinity, Marine salmon, Metals, Detergents, Water quality.
Identifiers: *Migration seaward, *Marine survival, *Salinity preference, *Fraser River.

Seaward migrating juvenile sockeye (Oncorhynchus nerka) from five lakes in the Fraser watershed were examined in a preliminary attempt to define some of the factors causing variable marine survival to the adult stage. Water quality of rivers utilized by the seaward migrating smolts appeared to be acceptable. No toxicants in the form of heavy metals, herbicides, pesticides, or detergents were detected at lethal threshold concentrations. At the onset of migration, the different groups varied in their tolerance of sea water, but all could tolerate 30 parts per thousand (0/00) salinity within the time required to reach the estuary. Preference tests of smolt behavior in a vertical salinity gradient indicated a time lag from the onset of migration to the acceptance of sea water which increased in proportion to the distance between the individual lake of origin and the estuary. However, once each group of smolts had accepted sea water, little or no acclimation was needed to transfer smolts from fresh water directly into 30 0/00 salinity. A delay in salinity preference and tolerance relative to the onset of seaward migration is suggested as a possible factor related to variation in marine survival of sockeye smolts.

PATTERNS OF INSECTICIDE RESISTANCE IN THE MOSQUITOFISH, GAMBUSIA AFFINIS,
Mississippi State Univ., State College. Dept. of Zoology.
Dudley D. Culley, and D. E. Ferguson.
Journal Fisheries Research Board of Canada, Vol 26, No 9, p 2395-2401, 1969. 3 tab, 15 ref.

Descriptors: *Pesticide toxicity, *Chlorinated hydrocarbon pesticides, *Fish, Bioassay toxicity, *Organophosphorous pesticides.
Identifiers: *Mosquito fish, *Pesticide resistance.

The insecticide resistance of a resistant mosquitofish population (Belzoni, Miss.) was compared to that of a sensitive population using 28 insecticides of 5 major groups (chlorinated hydrocarbons and organic phosphorous compounds). The 48-hour bioassay showed that the resistant fish had developed a tolerance only to the toxaphene-endrin related insecticides. The patterns of resistance in mosquitofish are similar to those in many resistant arthropods. (Katz-Washington)

WATER QUALITY CRITERIA FOR EUROPEAN FRESHWATER FISH; REPORT ON WATER TEMPERATURE AND INLAND FISHERIES BASED MAINLY ON SLAVONIC LITERATURE.
Food and Agriculture Organization of the United Nations, Rome (Italy). European Inland Fisheries Advisory Commission.

European Inland Fisheries Advisory Commission, Working Party on Water Quality Criteria for European Freshwater Fish, EIFAC Tech Paper No 6, Rome, 1968. 32 p, 85 ref.

Descriptors: *Fish, *Water pollution, *Water temperature, *Water quality, Fish physiology, Bibliographies, Acclimatization.
Identifiers: *Water Quality Criteria, *Temperature range, *Temperature acclimatization, *Seasonal temperature tolerance, *Salmonid temperature tolerance, Developmental stage.

A review of the European literature on thermal requirements of European Freshwater fish with particular attention to Eastern European sources and review which is designed to help formulate water quality criteria, indicate that fish differ in tolerance to high temperature. Tolerance varies with species, stage of development, acclimatization temperature, dissolved oxygen, and other pollution sources. In this review, temperature criteria are proposed which take no account of other pollution. Different temperatures are permissible at different times of the year. For salmonids, 20 to 21 deg C is the upper permissible temperature during summer while cyprinids can tolerate 30 deg C. (Katz-Washington)

CHRONIC TOXICITY OF ZINC TO THE FATHEAD MINNOW, PIMEPHALES PROMELAS RAFINESQUE,
Newton Fish Toxicology Lab., Cincinnati, Ohio.
William A. Brungs.
Transactions of the American Fisheries Society, Vol 98, No 2, p 272-279, Apr 1969. 8 tab, 1 fig, 16 ref.

Descriptors: *Bioassay, *Fish reproduction, Toxicity, Freshwater fish, Metals.
Identifiers: *Continuous flow bioassay, *Fathead minnow, *Chronic toxicity, *Fish production, *Fish survival, *Fish growth, Zinc, Application factor, 96-hr. median tolerance limit.

A continuous-flow bioassay was conducted for 10 months to determine the chronic effect of zinc on fathead minnows (Pimephales promelas Rafinesque). Fish porduction, as based on survival, growth, and reproduction, was investigated. Reproduction by the test fish was almost totally inhibited at zinc concentrations that had no effect on survival, growth, or maturation of these same fish. At these same concentrations there was also no effect on survival of control eggs and fry. The number of eggs produced per female in the low zinc concentration (0.18 mg/l) was only 17 percent of the eggs produced in the control (0.03 mg/l of zinc). Application factors based on these data and the 96-hour median tolerance limit (9.2 mg/l) are discussed. (Katz-Washington)

RECOVERY OF A SALT MARSH IN PEMBROKESHIRE, SOUTH-WEST WALES, FROM POLLUTION BY CRUDE OIL,
Field Studies Council, Pembroke (England). Oil Pollution Research Unit.
E. B. Cowell, and J. M. Baker.
Biological Conservation, Vol 1, No 4, p 291-296, July 1969. 2 fig, 2 tab, 8 ref.

Descriptors: *Algal poisoning, *Marsh plants, *Oily water, Aquatic algae, Marine algae, Oil, Marsh, Pollutants.
Identifiers: *Salt marsh, *Oil pollution, *Recovery from pollution, *Kuwait crude, Bentlass Salt Marsh.

An account of the biological effects of a spill of Kuwait crude oil on the plants and algae of the Bentlass Salt Marsh near Pembroke, S.W. Wales. Some species of the marsh plants were more affected by the oil than others. Spill occurred in January 1967 but by June 1968, most of the species affected were showing some signs of recovery with the exception of Triglochin maritima. No animal observations. (Katz-Washington)
W70-01231

FISHERY MANAGEMENT WITH THE HELP OF THE ORGANOPHOSPHORUS INSECTICIDE, THIOMETON,
Bihar Univ., Muzaffarpur (India). Dept. of Zoology.
S. K. Konar.
Ichthyologica, Vol IV, Nos 1-2, p 28-36, 1965. 5 tab, 8 ref.

Descriptors: *Insecticides, *Fish control agents, *Fish management, *Piscicides, *Organophosphorus pesticides, Fish farming, Aquatic insects.
Identifiers: *Thiometon, Toxicity bioassays, Labeo, Notonecta.

Experiments were conducted to determine usefulness of Thiometon, an organic phosphorus insecticide in the management of the pond fish Labeo. The minimum lethal doses of Thiometon to Labeo and nine species of undesirable organisms was determined. The LD0, LD50, LD100 of Thiometon vary from 0.50 to 6.4 ppm, 0.32 to 13.49 ppm, and 0.56 to 20 ppm respectively for fishes and from 0.008 to 0.40 ppm, 0.035 to 0.835 ppm and 0.05 to 2.0 ppm for insects. Except for Cyclops and Nauplius, all fish food organisms tolerate 1 ppm Thiometon. Thiometon is detoxified in 8 days in the field. (Katz-Washington)
W70-01232

A COMPOSITE RATING OF ALGAE TOLERATING ORGANIC POLLUTION,
Federal Water Pollution Control Administration, Cincinnati, Ohio.
C. M. Palmer.
Journal of Phycology, Vol 5, No 1, p 78-82, 1969. 11 tab, 29 ref.

Descriptors: *Algae, *Aquatic algae, *Aquatic environment, Pollutants, Biological communities, Water pollution effects, Diatoms.
Identifiers: *Pollution-tolerant algae, *Blue green algae, *Euglena, Pigmented flagellates.

From information on pollution-tolerant algae compiled from reports from 165 authors, the genera and species most often referred to as significant fall into a relatively stable series. Diatoms, pigmented flagellates, green, and blue-green algae are all well represented among the pollution-tolerant genera and species. The top 8 genera are Euglena, Oscillatoria, Chlamydomonas, Scenedesmus, Chlorella, Nitzshcia, Navicula, and Stigeoclonium, and the top 5 species, Euglena viridis, Nitzschia palae, Oscillatoria limosa, Scenedesmus quadricauda, and Oscillatoria tenuis. In some genera, e.g., Euglena, a single species is far more significant than all others as a pollution-tolerant form. In other genera, e.g., Oscillatoria, only a slight difference distinguishes the pollution tolerance of 2 or more species. Algal genus and species pollution indices are presented for use in rating water samples with high organic pollution. (Katz-Washington)
W70-01233

SOME OBSERVATIONS OF CLOUD INITIATION IN INDUSTRIAL AREAS,
Public Health Service, Washington, D.C.
G. E. Stout.
SEC Technical Report A62-5, Symposium, Air Over Cities, Cincinnati, Ohio, p 147-153, Nov 1969. 2 fig.

Descriptors: *Clouds, *Air pollution, *Temperature, Tornadoes.
Identifiers: Industrial pollution.

Landsberg and Changnon have suggested that precipitation over an urban area is greater than over the rural area. Telford, of the CSIRO in Australia recently concluded that a portion of freezing nuclei in the atmosphere comes from certain types of industrial activity. A petro-chemical industry, located in the rural area of central Illinois, has been observed to initiate clouds. At least five cases are partially documented by surface, airborne, or radar observations. On one occasion a cumulus congestus cloud formed and produced tornado funnels. These clouds were formed at a small distance down wind from the heat source. No other clouds were present in the area. Preliminary occasional observations suggest that this industrial source could be used for an interesting reaearch study of the possible influence of industrial pollution on cloud formation. (Upadhyaya-Vanderbilt)

EFFECT OF POLYELECTROLYTES IN CONJUNCTION WITH BENTONITIC CLAY ON CONTAMINANTS REMOVAL FROM SECONDARY EFFLUENTS,
Technion - Israel Inst. of Tech., Haifa. Sanitary Engineering Lab.
M. Rebhun, N. Narkis, and A. M. Wachs.
Water Research, Vol 3, No 5, p 345-355, May 1969. 11 p, 7 fig, 1 tab, 16 ref. Work partially sponsored by US Dept of Agri. Grant No FG-IS-148, USDA.

Descriptors: *Tertiary treatment, *Clays, *Coagulation, *Adsorption, *Flocculation, *Water reuse, Water quality, Water pollution, Chemical oxygen demand, Turbidity, Color, Organic matter, Phosphates, Nitrogen compounds, Organic compounds, Water purification.
Identifiers: *Residual organic removal, Secondary effluents.

The efficiency of flocculation by polyelectrolytes and clays in removing the residual organics and other refractory matter from secondary effluents was investigated. Attempts were made to clarify the mechanisms of interaction between the polyelectrolyte, the clay in the various refractory organics in secondary effluents. The parameters studied include chemical oxygen demand, turbidity, color phosphate, nitrogenous compounds, and ABS. Cationic polyelectrolytes react with various substances in solution, particularly anionic organic matter. The reaction products are colloidal and do not settle rapidly. The bentonite removes some organic compounds, mostly nitrogenous organics. The mixture of benonite and cationic polyelectrolytes improve the efficiency of organic removal and lowers the required flocculant dose. The clay itself removes 74% of the total COD. The surface reactions and mechanisms are also discussed in this paper. (Carstea-USGS)

THE USE OF THE FUNDAMENTAL STUDIES OF BIOLOGICAL PURIFICATION ON THE PURIFICATION OF POLLUTED WATERS DERIVED FROM PRODUCTION OF 'KHEMLON' (SLOVAKIAN),
Zdena Nanackova-Zekeova.
Russian and German summaries. Vyskumny Ustav Vodohospodarsky, Bratislavia, 1966. 79 p, 14 fig, 13 tab, 25 ref.

Descriptors: *Industrial wastes, *Industrial water, *Pollution abatement, *Biological treatment, Cotton, Runoff, Silts, Oxygen, Stagnant water, Phosphorus, Nitrogen, Air circulation, Oxidation, Biodegradation, Water reuse, Waste water treatment.
Identifiers: *Slovakia, Industrial waste water, Biological purification.

Purification of industrial waste water from the production of cotton material was investigated by using a method of silt activation. The success of the method depends on the concentration of fresh running water, optimal load, optimal time period of activation, concentration of activated silt, amount of feeding material, and the intensity of air circulation. The efficiency of purification also requires some addition of phosphorus, usually absent in fresh running waters. (Gabriel-USGS)
W70-00879

NUCLEAR POWER PLANT SITING IN THE PACIFIC NORTHWEST FOR THE BONNEVILLE POWER ADMINISTRATION,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.
H. Harty, R. F. Corlett, and R. E. Brown.
Summary Research Report, Battelle-Northwest, July 1967. 50 p, 16 fig.

Descriptors: *Thermal pollution, *Cost analysis, Nuclear power plant.
Identifiers: *Siting consideration, *Public acceptance factor, *Site economic factor, Pacific Northwest site areas.

The factors which are taken into account for site selections are physical and environmental site factors, population of surrounding areas, geology and hydrology, meteorology, heat dissipation and biological effects. The significant factors in site cost are condenser size and cost, natural- and induced draft cooling towers, land and site preparation costs, site access, engineered safeguards and multiple-reactor siting. For the sites considered, the method of handling waste heat was the single most important economic variable. It was found that once-through cooling with fresh water was the most economical method of disposing of waste heat. Once-through cooling with salt water increased capital costs about $3/kW and unit power costs about 0.045 mill/kW-hr. The use of cooling towers for waste heat discharge increased capital costs about $10/kW and unit power costs about 0.14 mill/kW-hr. A major economic tradeoff exists among the method of handling waste heat, transmission costs, engineered safeguards costs (which tend to increase as sites approach many load centers, i.e., urban areas), land costs (generally higher near urban areas) and other factors. (Upadhyaya-Vanderbilt)

COPING WITH COOLING TOWER BLOWDOWN,
T. C. Hoppe.
Industrial Water Engineering, p 27-32, Dec 1966. 5 fig, 8 ref.

Descriptors: *Thermal pollution, *Cooling tower, Chemical waste, Corrosion control, Cost comparison, Films.
Identifiers: *Corrosion inhibitor, Cooling water treatment, Tuberculation.

A case study is presented of industrial cooling water treatment with inflow process temperatures of 116F to 350F, and 90F to 140F out, with a maximum water temperature differential across the tower of 31F. Well water was treated with acid for pH control, shock chlorination for biocide, and non-chromate proprietary blend of polyphosphates and polyvalent ions for corrosion inhibition. Operating experience showed severe corrosion and iron oxide and phosphate sludge deposits. A new corrosion inhibitor in the form of zinc, and biodegradable organic material, without chromate nor phosphates, was tried. Very good results were obtained, uniform protective film formation was evident, previous tuberculation decreased, and no sludge accumulated. Costs rose from $0.0606 to $0.1275 per 1000 gallons of makeup, but this was far less expensive than other alternatives. (Rietveld-Vanderbilt)

COOLING TOWERS FOR STEAM-ELECTRIC STATIONS - ECONOMIC APPLICATIONS,
Ebasco Services Inc., New York.
Louis Elliott.
Transactions of the American Society of Mechanical Engineers, Vol 73, p 1027-1029, 1951. 3 fig, 1 tab.

Descriptors: *Cooling towers, *Steam, *Economic efficiency, Heated water, Condensation.

The objective of this study was to indicate a method for an economic comparison between direct use of river or pond water for condensing arrangement for a steam station and utilization of cooling towers. The comparison was made utilizing data on river temperatures and records of atmospheric temperature and humidity over a longer period. In a particular case studied, maximum plant capability of a cooling tower plant as compared with a direct condensing, is penalized by from 2 to 3 percent. Remarks on the cooling tower performance, location and orientation of towers are mentioned. Because a great deal of information is necessary to determine the best placement of a tower, research needs are mentioned. (Guerrero-Vanderbilt)

CATAD SYSTEM CONTROLS FOR REGULATION OF COMBINED SEWAGE FLOWS,
Municipality of Metropolitan Seattle, Wash.; and Metropolitan Engineers, Seattle, Wash.
Charles V. Gibbs, and Stuart M. Alexander.
Water and Wastes Eng, p 46-49, Aug 1969. 2 fig.

Descriptors: *Mathematical models, *Computer programs, *Sewers, *Storage capacity, *Storm runoff, Sewage disposal, Minicipal wastes, Automatic control, Hydrologic properties.
Identifiers: Combined sewers.

The installation of a computer-augmented treatment and disposal (CATAD) system to utilize optimum storage within an existing municipal combined sewer system was described. The other objectives of CATAD were (1) to make available the maximum capacity of the interceptor for combined storm and sanitary flows in unseparated areas by utilizing the storage capability of trunk and interceptor sewers in separated areas; and (2) to control necessary overflows at selected locations so as to minimize harmful effects on marine life and public beaches. Control commands were generated internally by a computer under program control. A mathematical model was developed in order to implement a fully automatic control. The model incorporated elements of meteorology and hydrology including seasonal precipitation patterns and areal runoff characteristics. An analysis of the regulation of stormwater inflows by the use of trunk sewer storage established the operating rules required for effective utilization of the available storage. (Thiuri-Cornell)

OPTIMIZATION OF THE ACTIVATED SLUDGE PROCESS-OPTIMUM VOLUME RATIO OF AERATION AND SEDIMENTATION VESSELS,
Kansas Univ., Lawrence. Dept. of Chemical and Petroleum Engineering; and Kyoto Univ. (Japan). Dept. of Chemical Engineering.
M. Naito, T. Takamatsu, and L. T. Fan.
Water Res, Vol 3, No 6, p 433-443, June 1969. 8 fig, 6 ref.

Descriptors: *Optimization, *Activated sludge, *Aeration, *Sedimentation, *Mathematical models, Mixing, Sludge treatment, Capital, Design, Volume.
Identifiers: Recirculated sludge.

A mathematical model was developed for optimizing the total activated sludge system. The optimum volume ratio of the aeration and sedimentation tanks and the recirculation ratio of the sludge were computed. The objective of the two computations was the minimization of the total capital cost and the total volume. Both objective functions gave almost the same results. Total capital cost increased with the increase of the mixing in the aeration tanks. The results obtained in the study were for steady state operation. It was found out that the optimum volume ratio of the aeration to sedimentation tanks and sludge recirculation did not vary greatly from the design conditions adopted in current plants. A SYSTEMS APPROACH TO WASTE MANAGEMENT,
Massachusetts Univ., Amherst.
Richard J. Giglio, Donald D. Adrian, Frank C. Kaminsky, and Robert F. Rikkers.
Proc, Fourth Amer Water Resources Conf, NY, p 344-353, Nov 1968. 10 p, 2 fig, 9 ref.

Descriptors: *Systems analysis, *Waste water treatment, *Optimization, *Regional analysis, *Decision making, Planning, Mathematical models, Computers, Treatment facilities, Interception, Cost allocation, Water management (Applied).

The use of systems analysis to optimize regional planning for waste water systems was described. The objective of the study was to develop a methodology and mathematical-computer models which could aid planning agencies to make decisions concerning regional development. A region in Massachusetts was selected for the pilot application. A waste system was divided into the following subsystems; collection facilities, interceptors, various types of treatment plants, storage facilities and the stream. Engineering and economic data were used to describe and model each subsystem. Optimization techniques then helped define the most efficient configuration of subsystems for regions with differing characteristics. Attention was also given to procedures for implementing the plans and equitably allocating costs among communities. (Thiuri-Cornell)

RADIOTRACER STUDY OF RAPID SAND FILTRATION,
Georgia Inst. of Tech., Atlanta.
Thomas Fisher Craft, Jr.
Available from the Clearinghouse as PB-187 522, $3.00 in paper copy, $0.65 in microfiche. Water Resources Center, Georgia Institute of Technology, Partial Completion Report WRC-0469, August 1969. 179 p. OWRR Proj B-020-GA.

Descriptors: *Rapid sand filtration, *Porous media filter, *Drinking water treatment, *Radioactive tracers, *Filtering system, Cesium-137, Filter sands, Radioisotopes, Adsorption, Particle shape, Particle size, Pores, Porosity, Colloids, Flocculation.

The research was designed to investigate the mechanism by which suspended particles are removed from flowing water during passage through a porous medium. Particles labeled with radioactive Cesium-137 were suspended in water and passed into a laboratory scale filter built to simulate a commercial water filter. Radiation detection equipment was used to follow the radioactive particles. Three different sizes of sand and ground anthracite were used as filter media. The pattern of deposition was found to depend on the absolute and relative sizes of the suspended particles and the stationary grains. In a given filter medium, particle removal was found to vary directly with the particle diameter. For a given particle size, removal was found to vary inversely as the diameter of the filter bed grains. Interdependence of grain and suspended particle dimensions is such that the filter coefficient was found to vary inversely in a linear fashion with the ratio of pore diameter to particle diameter for ratios of about five or less. Additional work is needed to relate the ideal laboratory conditions to actual conditions encountered in the field. (Conway- Georgia Tech)
W70-00910

THE INFLUENCE OF SUSPENDED SOLIDS ON THE RATE OF OXYGEN TRANSFER IN AQUEOUS SOLUTIONS,
G. T. M. Van der Kroon.
Water Research, Vol 2, No 1, p 26-30, Jan 1968. 5 fig.

Descriptors: *Dissolved oxygen, *Oxygenation, *Respiration, *Suspended load, Solid wastes, Dissolved oxygen analyzers, Waste assimilative capacity, Activated sludge, Gases, Microorganisms, Clays, Laboratory tests.
Identifiers: *Oxygen transfer, *Holland, Rotterdam, River pollution, Sludge liquor.

The relationship between dissolved-oxygen content and the rate of respiration of microorganisms was studied in a mixed liquor from activated sludge plants and in Rotterdam tap water. The experimental apparatus allowed for a constant rate of gas flow and injection of oxygen when its partial pressure in the gas decreased. The oxygenation capacity and maximum rate of oxygen absorption were measured and the ratio between them was plotted against suspended solids concentration. It was concluded that the suspended solids concentration played an important role in the oxygen transfer in various solutions. The properties of clay and aluminum sulfate suspensions resembled those of a mixed liquor with respect to oxygen transfer. (Carstea-USGS)

MODIFIED FILTER MEDIA FROM REMOVAL OF WATER POLLUTANTS,
C. D. Agarwal, and A. V. S. Prabhakara Rao.
Water Research, Vol 2, No 1, p 43-45, Jan 1968. 6 ref.

Descriptors: *Water pollution treatment, *Filtration, *Water pollution control, *Filters, Sewage effluents, Electrolytes, Zeta potential, Bacteria, Protozoa, Algae, Solid wastes, Tertiary treatment.
Identifiers: Polyelectrolyte-coated filters, Bauxite.

A simple filter was developed for efficient removal of micronesized particles. These particles include some bacteria, protozoa, algae, cysts, and even some worms. Sewage particles carry small electrokinetic charges (surface zeta potentials), which are generally negative. The efficiency of filtration can be greatly improved if the filter media are coated with cationic polyelectrolytes to retain the negatively charged particles. The experimental results obtained by using bauxite coated filters were comparable with those using polyelectrolytes. The economics of the designed criteria for this filration progress are evaluated. AN EXAMINATION OF THE BENEFITS AND DISADVANTAGES WITH RESPECT TO THE DISPOSAL OF SOLID WASTES,
American Society of Civil Engineers, New York.
Donald H. Waller.
Available from Clearinghouse as PB-186 006 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project, Technical Memorandum No 10, Feb 1, 1968. 54 p, 2 fig, 1 tab, 21 ref. FWPCA Program No 11020 EKO.

Descriptors: *Cost-benefit analysis, *Deposition (Solid wastes), *Sewage treatment, Pressure conduits, Sewers, Solid wastes.
Identifiers: Grinding, Solid waste characteristics, Transport velocity.

Important considerations in an evaluation of the feasibility and benefits of adapting any sewerage system to solid wastes disposal are: the extra solids load that community refuse could add to a sewage disposal system; velocities required to move solid wastes and the effect of flow variations on sewer velocities; solid wastes separation practices and attitudes toward separation of household refuse; the need for grinding, and considerations involved in the development of a household refuse grinding device; the effects of solid wastes on sewage treatment processes; and costs and benefits involved in evaluation of alternative systems for disposal of sewage and solid wastes. Considerations peculiar to the ASCE Project scheme are: the possibility of adapting building sewage storage-grinder-pump units for handling solid wastes; the need to discharge solid wastes into the system under pressure; reduced clearances in the small pipes of a pressure system; and the possibility of greater solids deposition at low flows. Appendices include information on: composition and characteristics of solid wastes; pertinent solid wastes research and development; and results of research on transport and treatment of solid wastes in sewage disposal systems. OIL FIELDS YIELD NEW DEEP-WELL DISPOSAL TECHNIQUE,
Halliburton Co., Duncan, Okla. Dept. of Chemical Research and Development.
K. A. Slagle, and J. M. Stogner.
Water and Sewage Works, Vol 116, No 6, p 238-244, June 1969. 7 p, 5 fig, 13 ref.

Descriptors: *Waste disposal, *Injection wells, Fractures (Geology), Permeability, Well casings, Monitoring, Oil industry, Geology, Waste treatment, Waste water disposal, Solid wastes.
Identifiers: *Well construction.

The predominant practice of injecting liquid wastes into permeable or naturally fractured subsurface strata is not the only method for the disposal of pollutants in deep wells. Utilizing other oil field operations such as hydraulic fracturing and other modifications may eliminate some common objections to this procedure-- lack of suitable formations, expensive pre-injection equipment and treatment, and production of a secondary waste presenting in itself a disposal problem. Each particular waste disposal problem should be treated as a separate entity since the problems involved are so different throughout the various industries. A second waste disposal well, or a stand-by well, should be considered if the production of waste is such that general plant production may be interrupted or there is a possibility of discharging effluent into public streams or waters. A monitoring well system should be included to help detect or determine possible contamination or damage to fresh water aquifers and other minerals. Design of the well casing and equipment should be given serious consideration and the utmost in design precautions taken to provide maximum protection and longevity. Under normal low pressure disposal operation where naturally fractured formations are used, low pressure equipment may be utlized with pre-injection treatment facilities. (Knapp-USGS)

CAUSES AND CONSEQUENCES OF POND EUTROPHICATION (POLISH),
Polish Academy of Sciences, Krakow.
Stanislaw Wrobel.
English summary. Acta Hydrobiologica, Vol 7, No 1, p 27-52, 1965. 15 fig, 6 tab, 28 ref.

Descriptors: *Eutrophication, *Fertilization, *Nitrogen compounds, *Phosphorus compounds, *Thermal stratification, *Oxygenation, Organic matter, Respiration, Copper sulfate, Lime, Dissolved oxygen, Fish, Fish parasites, Water quality control, Water quality.
Identifiers: Fish respiration, Fish density, Carp culture, Branchiomyces sanguinus, Golysz Experimental Station (Poland), Water quantity, Water exchange, Oligotrophy, Polytrophy.

Results are reported of attempts to increase productive capacity of ponds by application of lime, and nitrogen- and phosphorus-fertilizers to encourage eutrophication, and by additions of copper sulfate to control excessive algal growth. Such management revealed a sequence of three trophic levels: oligotrophic, before fertilization; eutrophic, during fertilization; and polytrophic, during the intensive fish feeding. The latter phase induced periodic acute oxygen deficiency, endangering respiratory organs of fish and inviting the invasion of fish gills by Branchiomyces sanguinis. Maintenance of an adequate degree of water oxygenation requires control of organic matter content, occasional exchange of water of the pond, and a correlation of fertilization, feeding, and density of fish with the amount of inflowing water. WATER QUALITY AND REGIONAL ECONOMY, A DECISION MODEL,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
David L. Raphael, and James Maugeri.
Proc, Fourth Amer Water Resources Conf, NY, p 132-139, Nov 1968. 8 p, 3 tab, 5 ref.

Descriptors: *Water quality, *Industrial water, *Decision making, *Leontief models, *Input-output analysis, *Pollution abatement, Water supply, Taxes, Waste water treatment, Economics, Regional analysis.

A Leontief input-output economic model was constructed to demonstrate how such a model could be utilized to bring rationality into regional decision making with respect to a specific water quality problem. Clinton County, located in Central Pennsylvania, was chosen for the study. The industry selected was a paper mill located in the county. It was assumed that the water quality was so poor that a substantial cost would be incurred by the industry in order to bring its quality to a usable level. It was also assumed that if the cost became prohibitive the industry would leave the county. Three alternatives were considered (1) closing the plant, (2) tax forgiveness, and (3) providing the plant with water of sufficient quality from local water utilities. It was concluded that (1) the penalty paid by the region by the closing of the mill was extremely large, (2) that the tax forgiveness amount could be passed along to the household sectors as a local tax increase thus returning the region to the status quo, and (3) that if the local utility could handle the increased needed supply at reduced income, the region would retain the mill and realize increased economic activity as well. THE CONSTITUTIONAL ASPECTS OF WATER POLLUTION AND THE NEED FOR GOVERNMENTAL COOPERATION,
Brian A. Stamp.
Agassiz Center for Water Studies Research Report, Univ of Manitoba, Vol 1, No 2, ch 7, 1968. 25 p, 42 ref.

Descriptors: *Water pollution control, *Water pollution, *Federal-state water rights conflicts, *Governments, Federal government, State governments, Natural resources, Political aspects, Water conservation, Water resources, Water supply, Jurisdiction, Federal jurisdiction, State jurisdiction, Water policy, Water quality, Water quality control, Impaired water quality, Public health, Administrative agencies, Fish management, Stream improvement, Navigable waters, Navigation, Legal aspects.
Identifiers: *Canada.

In Canada, jurisdiction over water pollution is divided between the provincial and federal governments. Under the criminal law power, Parliament may enact criminal legislation aimed at pollution as a danger to public health, and it is also authorized to set up an administrative body to regulate pollution and to enforce such legislation. The general power under the peace, order, and good government clause would allow the federal government to cure existing pollution and to prevent such pollution in the future. Legislative jurisdiction over fisheries extends to controlling water quality that might affect fish. The navigation and trade and commerce powers are of limited significance in this respect. The provinces have authority in the field of pollution control since ownership of water is vested in the provinces and since the problems have a valid local aspect. The provinces are authorized to

set up needed physical works. Since the pollution problem has both federal and provincial aspects, it is logical that it be solved at both levels with legislative programs complementing one another. (Douberley-Florida)

STATUTORY STREAM POLLUTION CONTROL,
Seymour C. Wagner.
U Pa L Rev, Vol 100, No 2, p 225-241, Nov 1951. 17 p, 115 ref.

Descriptors: *Pennsylvania, *Pollution abatement, *Water pollution control, *Water pollution sources, Acid mine water, Bacteria, Coal mine wastes, Legislation, Legal aspects, Judicial decisions, State governments, Industrial wastes, Mine acids, Pollutants, Sewage effluents, Sewage treatment, Water pollution effects, Chemical wastes, Municipal wastes, Water pollution treatment, Water quality control, Water quality, Stream improvement, Economic feasibility.

Using the highly industrialized and populous state of Pennsylvania, this note discusses: (1) various legal methods available on pollution abatement; (2) problems which municipalities, industries and the public encounter in meeting pollution control obligations; (3) types of pollution and the necessity for treatment of pollutants as well as their prohibition; (4) the problem of coal related pollution; (5) failure of common-law and equity enforcement in pollution control; (6) the necessity of interstate and federal action; (7) the development of statutory pollution control; and (8) the financial burden of stream purification. The note also examines statutory enforcement in the areas of industrial wastes and municipal sanitation along with statutory remedies. It is concluded that conflicting economic interests, excessive financial burdens, and unsolved engineering problems must all be considered in long range pollution control. The task of water pollution control boards must be to advance programs by determining which interests have valid claims and by calling for legislative and judicial aid where needed. The case of Pennsylvania Coal Co. v. Sanderson, 6 Atl 453 (1886) is discussed. (Marsee-Florida)
W70-00923

STATUTORY STREAM POLLUTION CONTROL,
Seymour C. Wagner.
U Pa L Rev, Vol 100, No 2, p 225-230, Nov 1941.

Descriptors: *Pennsylvania, *Pollution abatement, *Water pollution control, *Pollutants, Water pollution sources, Bacteria, Acid mine water, Coal mine wastes, Legislation, Legal aspects, Judicial decisions, State governments, Municipal water, Cities, Industrial wastes, Mine acids, Sewage effluents, Sewage treatment, Water pollution effects, Chemical wastes, Water pollution treatment, Water quality control, Water quality, Water purification, Stream improvement.

The pollution of any one stream will consist of a varying combination of three basic types of pollution: physical pollution, chemical pollution, and bacterial pollution. Mere legal prohibition of pollution is not enough; the law must require treatment of pollutants before they enter streams. Common-law abatement measures have failed primarily because, unless the public has acquired rights for water supply or unless there is a statute involved, pollution is an injury of which only riparian owners may complain. Equity enforcement is also limited in that, by balancing the interests of the parties, the benefit to the plaintiff of abatement may be found disproportionate to the injury to the defendant's operations or interests. The public, acting through elected officials, stands a greater chance of obtaining equity enforcement than an individual, but there has been a failure to seek such enforcement. Not only have municipalities been lax in seeking protection from pollution, but they have themselves contributed a major share of contamination in the form of raw sewage. (Marsee-Florida)
W70-00924

STATUTORY STREAM POLLUTION CONTROL,
Seymour C. Wagner.
U Pa L Rev, Vol 100, No 2, p 230-236, Nov 1951.

Descriptors: *Pennsylvania, *Pollution abatement, *Water pollution control, *Acid mine water, Water pollution sources, Coal mine wastes, Legislation, Legal aspects, Judicial decisions, State governments, Industrial wastes, Mine acids, Pollutants, Sewage effluents, Sewage treatment, Water pollution effects, Chemical wastes, Municipal wastes, Water pollution treatment, Water quality control, Water quality, Stream improvement, Water purification.

The case of Pennsylvania Coal Co v Sanderson, 6 Atl 453 (1886), involved water pollution by the discharge of acid mine drainage. In denying relief for such injury, the case undoubtedly discouraged proponents of clean streams. The effect was to retard pollution abatement progress in all types of pollution situations; however, the case is doubtful authority in any field other than acid mine drainage. The inadequacy of common-law enforcement in preserving clean streams has led all but three states to adopt some sort of general statutory control to prevent pollution. While these statutes in general merely re-affirm common-law rights and obligations, they do create new methods of enforcement. Early statutory regulation of pollution in Pennsylvania was limited to the problem of sewage and contained many exceptions, including industrial wastes. The current statute also contains a general prohibition against the discharge of sewage; however, the Sanitary Water Board has been lax in its enforcement and interpretation. Current statutes concerning industrial wastes are more forceful, and the power of the Sanitary Water Board is not so all-inclusive. The greatest unsolved pollution problem today is that of mine drainage. (Marsee-Florida)
W70-00925

STATUTORY STREAM POLLUTION CONTROL,
Seymour C. Wagner.
U Pa L Rev, Vol 100, No 2, p 236-241, Nov 1951.

Descriptors: *Pennsylvania, *Pollution abatement, *Water pollution control, *Economic feasibility, Water pollution sources, Coal mine wastes, Legislation, Legal aspects, Judicial decisions, State governments, Federal government, Industrial wastes, Pollutants, Sewage effluents, Sewage treatment, Water pollution effects, Chemical wastes, Municipal wastes, Water pollution treatment, Water quality control, Water quality, Stream improvement.

Since the very remedies which proved ineffective at common law and equity are incorporated into the present water pollution act, the basis of the clean stream program in Pennsylvania must be the efficient employment of an administrative program. Just as common-law enforcement was lax, so a statutory program will fail unless efficiently implemented. Because rivers frequently constitute or cross state boundaries, interstate and federal enforcement action is needed. There is a growing tendency toward interstate agreements, and the federal government has recently taken an active interest in river pollution control. The most publicized aspect of the clean streams program in Pennsylvania has been the restoration of the Schuylkill River; however, the major economic problem lies not in reclamation but in financing the complex facilities needed to prevent untreated wastes from reaching rivers. Numerous financial burdens and problems must be faced, especially by municipalities, in establishing such systems. In the case of industry, state and federal aid is virtually non-existent. Water pollution control boards must determine which interests have valid claims and call for legislative and judicial aid where needed. (Marsee-Florida)

WATER POLLUTION CONTROL AND ABATEMENT (BOOK REVIEW); CONTROLLING POLLUTION: THE ECONOMICS OF A CLEANER AMERICA (BOOK REVIEW),
Birch Bayh.
Notre Dame Lawyer, Vol 43, No 5, p 796-798, June 1968. 3 p, 2 ref.

Descriptors: *Air pollution, *Water pollution, *Pollution abatement, *Water pollution control, Water pollution effects, Water pollution sources, Water pollution treatment, Air pollution effects, Pollutant identification, Abatement, Air environment, Pollutants, Public health, Water allocation (Policy), Water resources, Water quality, Standards, Water, Economic feasibility, Economic impact, Economics, Benefits, Costs, Cost-benefit theory.
Identifiers: Book reviews.

Water Pollution Control and Abatement, edited by Ted L. Willrich and N. William Hines, advocates and has as its main thrust the premise that pollution control is a fundamentally local matter that requires effective interrelationship of three factors: (1) a sincere state commitment to clean waters mainfested in a workable regulatory scheme; (2) knowledge and dedication on the part of state officials administering control programs; and (3) public understanding of the nature of the pollution problem and public support of control efforts. The book is a collection of essays. Controlling Pollution: The Economics of a Cleaner America, edited by Marshall I. Goldman, is a more specialized analysis concentrating primarily upon theoretical and practical problems faced by those who wish to approach solutions within the framework of costs and benefits. The underlying question is how an affluent society such as our own can best eliminate or control the serious consequences of pollutants. Writers of both books agree that the fundamental question of water quality control is whether a democratic, highly developed political system can discover and implement a formula which will allocate air and water resources equitably. PAT HARRISON WATERWAY DISTRICT.
Miss Code Ann secs 5956-171 thru 5956-175, 5956-180, 5956-182 thru 5956-186, 5956-189 (Supp 1968).

Descriptors: *Mississippi, *Water districts, *Water policy, *Water conservation, Legislation, Construction, Irrigation water, Industrial water, Municipal water, Domestic water, Agriculture, Flood control, Pollution abatement, Taxes, Tax rate, Condemnation, Easements, Operating costs, Recreation, Right-of-way, Surface waters, Overflow, Fish conservation, Wildlife conservation, Water supply.

Authority is given to organize the Pat Harrison Waterway District to insure an adequate flood control program, provide a sufficient sanitary water supply, promote the balanced economic development of the state, and to aid in forest conservation, irrigation, and pollution abatement. All powers of the District are to be exercised by a Board of Directors. Procedures for creating the District through petitions, appointment of the directors, and organization of the Board are outlined. An extensive list of powers are granted to the District. Among these are the right to: (1) acquire land by purchase or condemnation; (2) overflow public lands; (3) impound surface or overflow water by constructing dams or reservoirs; (4) relocate highways, utilities, and railroads; and (5) develop plans and work with any federal or state agency. A series of limitations to the District's authority is included. The right to borrow money and issue bonds for the repayment thereof is granted. Taxing procedures are outlined and a special tax levy is provided for. Additionally, the Board of Directors is empowered to adopt all reasonable regulations to maintain sanitary water conditions, prevent waste, and regulate recreation. (Schram-Florida)

PAT HARRISON WATERWAY DISTRICT.
Miss Code Ann secs 5956-171 thru 5956-175 (Supp 1968).

Descriptors: *Mississippi, *Water districts, *Water policy, *Water conservation, Irrigation water, Industrial water, Municipal water, Domestic water, Recreation, Agriculture, Flood control, Pollution abatement, Water supply, Surface waters, Overflow, Forest management, Legislation, Optimum development plans, Water pollution, Construction.

Authority is given or organize the Pat Harrison Waterway District to conserve, utilize, develop, and regulate the overflow and surface waters so that their full beneficial use may be realized. This is deemed necessary to insure an adequate flood control program, provide a sufficient sanitary water supply, promote the balanced economic development of the state, and to aid in forest conservation, irrigation, and pollution abatement. The overflow waters for domestic, municipal, commercial, industrial, agricultural, and recreational uses are for the general welfare of the people of the state. All powers of the district shall be exercised by a Board of Directors. Provisions for the appointment of these directors, their compensation, term of office, and organization are detailed. The procedure for creation of the district through petitions is outlined. Hearings on such petitions and notice requirements are also dealt with. (Schram-Florida)
W70-00959

PAT HARRISON WATERWAY DISTRICT.
Miss Code Ann secs 5956-180, 5956-182 thru 5956-186, 5956-189 (Supp 1968).

Descriptors: *Mississippi, *Water districts, *Tax rate, *Water conservation, Fish conservation, Wildlife conservation, Taxes, Legislation, Assessments, Surface waters, Overflow, Water pollution, Pollution abatement, Condemnation, Right-of-way, Construction, Operating costs, Dams, Canals, Reservoirs, Recreation.

The powers of the district, through its Board of Directors, include the right to: (1) develop plans with any federal or state agency for public works; (2) impound overflow and surface water by constructing dams, reservoirs, or plants; (3) acquire by condemnation any needed property; (4) relocate highways, railroads, or any utility lines; (5) overflow any public lands; (6) construct any needed facility; (7) borrow money and issue bonds; (8) fix and collect charges for any services furnished; and (9) accept grants and exercise all other powers inherent in a corporate body. The power of taking land by purchase or condemnation is qualified, and the rights in such land which can be utilized are detailed. The district is authorized to establish parks and provide for fish and wildlife conservation. The Board of Directors has the power to adopt all reasonable regulations to maintain sanitary water conditions, prevent waste, and regulate recreation. Each county which is a member shall pay two mills of all ad valorem taxes due to the state to the district. A special tax levy, with bonds payable from ad valorem taxation, is provided. STREAM REAERATION USING MOLECULAR OXYGEN,
H. R. Amberg.
Water Research, Vol 2, No 1, p 42-43, Jan 1968.

Descriptors: *Reaeration, *Dissolved oxygen, *Streams, Waste treatment, Oxygen sag, Diffusion, Water pollution treatment, Turbulence, Mixing, Dispersion, Pacific Northwest U. S.
Identifiers: *Stream reaeration, Molecular oxygen.

Drought flows and high water temperatures are usually associated with low dissolved oxygen levels in streams. An engineering method of stream reaeration using molecular oxygen instead of air is discussed as an economical alternative to conventional waste treatment. The solubility of molecular oxygen is 500% more than oxygen in equilibrium with air. The experimental work was conducted in a stream in the Pacific Northwest by using a power turbine. The oxygen was introduced at locations with relatively high dissolved oxygen concentration. In subsequent experiments, the molecular oxygen was introduced by using diffusers placed on the river bottom. It is possible to introduce large amounts of dissolved oxygen by using this method. Oxygen introduction is not limited, however, to the positions of the stream with high dissolved oxygen deficit, but may be located a reasonable distance upstream of the area in which it is needed. (Carstea-USGS)

COMPREHENSIVE WATER RESOURCES STUDIES ON THE ARA VALLEY AREA, JAPAN,
Akinori Sugiki.
Water Research, Vol 2, No 1, p 16-20, Jan 1968. 1 fig, 3 tab.

Descriptors: *Water resources development, *Water pollution control, Water pollution sources, Water demand, Water supply, Water management (Applied), Water conservation, Water resources, Water quality control.
Identifiers: *Ara Valley (Japan).

A system to control water pollution for the Ara Valley, Japan is discussed. The area is very heavily populated and industrialized. Industrial and domestic sources of water pollution are estimated. Pollution loads will increase 7 to 8 times compared with the present load if the pollution is not controlled. The water demand for industrial and domestic uses was estimated to be about 48 million tons per day. Food, pulp, paper, and chemical industries should be forbidden in the area, whereas clothing industry, saw-mill and printing should be developed. These and other restrictions could reduce the estimated pollution load by 40%. Further research dealing with pollution load, techniques for pollution control and water consumption was recommended. (Carstea-USGS)
W70-01034

APPROACH TO DETERMINE THE MINIMUM ALLOWABLE FLOW IN THE TISZA RIVER, HUNGARY,
Bela Hock.
Water Research, Vol 2, No 1, p 13-16, Jan 1968. 2 fig, 2 tab.

Descriptors: *Water quality control, *Flow augmentation, *Oxygen requirements, River flow, Low-flow augmentation, Reservoir storage, Dam construction.
Identifiers: *Tisza River (Hungary), Water quality prediction.

The effects on water quality of a dam construction in the Tisza River, Hungary are predicted by determining the relationships between stream flow and water quality. Experiments were conducted between 1960 and 1965 to establish specific relationships between oxygen demand and stream flow in the Tisza River and its tributaries. The quality of water stored in the reservoirs of Tisza River Barrage No. II was slightly improved. The minimum water flow released from the reservoir was calculated so that the oxygen demand in the river should not exceed 10 mg/l. Two assumptions were made in this calculation: (1) the quality of water discharge from the reservoir was identical to that of incoming water; (2) the rate of organic matter decomposition was the same as in 1960. DILUTION OF WASTE EFFLUENTS IN WATERS (IN RUSSIAN),
I. D. Rodziller.
Nauchnyie doklady po voprosam samootchishchenia vodoyomov i smeshchenia stochnykh vod, p 25-38, Tallinn politecnic institute, Tallinn, ESSR, 1965.

Descriptors: *Water quality, *Waste dilution, Water pollution, Turbulence, Diffusion, Mass transfer, Stream pollution, Waste assimilative capacity, Water pollution effects, Mathematical models, Biochemical oxygen demand, Dissolved oxygen content, Water quality standards, Acidity.

A method of computation is presented which allows determination of (a) the distribution of Biochemical Oxygen Demand and Dissolved Oxygen below an effluent discharge into a stream including any number of effluent outfalls in both sides of the stream. The following equation was L (oi)= (L (o) to the P power) x (10 to the-Kpt power)+ A+ B for BOD concentration where L (o) to the P power is BOD of water upstream of effluent outfall, 'A' represents the sum of the effects of all effluent outfalls on the side where the main effluent outfall lies, and 'B' represents the same for the opposite side; (b) The distance below the effluent discharges where complete mixing takes place was also determined by a formula; and (c) Effects of acids and bases on water quality are discussed, and formulas are presented for calculation of pH, acidity and alkalinity. (Novotny-Vanderbilt)

STATEMENTS OF POLICY ON PUBLIC WATER SUPPLY MATTERS--AMERICAN WATER WORKS ASS'N PRINCIPLES OF NATIONAL WATER POLICY.
Amer Water Works Ass'n J, Vol 61, No 10, Part 2, p 22-26, Oct 1969. 5 p.

Descriptors: *Water pollution, *Water policy, *Water pollution control, *Water resources development, Pollution abatement, Water users, Water treatment, Water storage, Low flow, Low flow augmentation, Federal government, State governments, Coordination, Planning, Organizations, Recreation, Water quality, Regulation, Water sources.

The American Water Works Association recommends a sound water resources policy based on planning and careful management. The responsibility for assuring water quality rests with those persons returning wastes to our resources. All government levels must act together in programs of pollution control and abatement and water resources data accumulation. The federal government should support state and local water programs rather than pre-empt them, except in cases where economic and planning complexities are beyond local capacity. A single state agency should be established in each state to provide a unified and coordinated water resources policy. Local public water suppliers should continue planning, financing, and operating systems for public and industrial users. The Association recognizes that as an interim measure it may be necessary to release water from storage for low flow augmentation rather than provide the high degree of waste treatment otherwise required. The Association opposes legislation permitting the opening of domestic water supply reservoirs to recreational use and urges control over waste discharges and land use affecting water sources. THE FEDERAL GOVERNMENT AND AIR AND WATER POLLUTION,
Paul E. Bermingham.
Bus Lawyer, Vol 23, No 2, p 467-481, Jan 1968. 15 p, 68 ref.

Descriptors: *Federal government, *Water pollution, *Water pollution control, *Federal jurisdiction, Regulation, Pollutants, Water supply, Recreation, Water quality control, Rivers and Harbors Act, Navigation, Treaties, Interstate rivers, Navigable waters, Cities, Legislation, Administrative agencies, Pollution abatement, Judicial decisions, Legal aspects, State jurisdiction, Effluents, Watercourses (Legal), Water pollution effects, Water pollution sources, Water pollution treatment, Standards.
Identifiers: *Water criteria, *Coastal waters, Injunctions (Prohibitory).

The author indicates that there is a four-step approach to pollution control: (1) water criteria which is an expression of the effect of various concentrations of pollutants depending on the intended use of body of water; (2) water quality standards which prescribe pollutant levels that cannot legally be exceeded; (3) effluent standards which prescribe the maximum amount of a specified pollutant that can be discharged from individual sources during specified time periods into specified waterways; and (4) control requirements which

regulate pollutant treatment before discharge. The history of pollution and the control role of the federal government are traced via federal legislation from the Rivers and Harbors Act of 1899 to the Federal Water Pollution Control Act of 1956. The 1956 Act gave each state until 1967 to adopt water quality standards for interstate waters within its borders. If a state did not comply, the Department of the Interior set the standards. The author points out how the federal government has extended its jurisdiction in the area of pollution control through expanding definitions of such terms as 'navigable waters', 'interstate waters', and 'coastal waters.' The questions of the constitutionality of the Act and abatement proceedings under the Act are briefly discussed. (Keith-Florida)

OBSTRUCTION AND POLLUTION OF WATERS.

Miss Code Ann secs 2414, 2415 (1956), sec 2415.5 (Supp 1968).

Descriptors: *Mississippi, *Water pollution, *Water pollution control, *Obstruction to flow, Pollution abatement, Impaired water quality, Pollutants, Public health, Riparian rights, Standards, Wastes, Water conservation, Legislation, Sewage, Industrial wastes, Municipal wastes, Sewage disposal, Sewerage, Water pollution sources, Fish, Navigable waters, Navigation.

Any person who unreasonably obstructs any navigable waters or pollutes any such waters rendering them less fit for drink or for sustaining fish shall be guilty of a misdemeanor punishable by not more than a fifty dollar fine and/or imprisonment for thirty days. This shall not be construed to prevent any municipality from constructing sewers that empty into any navigable stream whose length is twenty-five miles or more. The State Board of Health, when public health requires, may prevent such emptying of sewerage or require steps to correct any evil that may exist. It is unlawful for any creosoting plant or any sawmill to dump wastage into any running stream. Any violation shall be deemed a misdemeanor punishable by a fine of not less than twenty-five dollars and not more than one hundred dollars for each offense. Each day that this section is violated shall constitute a separate offense. It is a misdemeanor for anyone to push, fell, or cut trees in excess of six inches in diameter into a running stream when such trees will materially impede the flow of or navigation upon such stream. (Schram-Florida)

GENERAL PROVISIONS OF THE STATE WATER CONTROL LAW.
Va Code Ann secs 62.1-14, 62.1-16 thru 62.1-18 (1968).

Descriptors: *Virginia, *Water quality, *Water quality control, *Water pollution control. Legislation, Legal aspects, Water control, Water law, Fish reproduction, Aquatic life, Fish conservation, Pollution abatement, Water rights, Permits, Wastes, Sewage, Recreation, Public health, Shellfish, Administration, State governments, Administrative agencies.
Identifiers: *Pollution prevention, *Waste discharge, *Public water uses, Public policy, Penalties (Criminal).

It is the policy of the state and the purpose of this chapter to: 91) maintain or restore all state waters to a condition of quality that will permit all reasonale public uses and support the propagation and growth of all aquatic life; (2) safeguard the clean waters of the state from pollution; (3) prevent any increase in pollution; and (4) reduce existing pollution. No right to continue existing pollution in any state water will exist, nor will such right be or be deemed to have been acquired because of past or future pollution. The right and control of the state in and over all state waters is expressly reserved and reaffirmed. It is declared to be against public policy and a violation of this chapter for any owner who does not have a State Water Control Board certificate to discharge wastes or noxious or deleterious substances into state waters or to otherwise alter the physical, chemical, or biological properties of state waters so as to diminish the usefulness of such waters. This chapter is supplemental in nature and will not be construed to repeal existing law; the administration of existing pollution law will be in accord with the purposes of this chapter. (Keith-Florida)

POWERS AND DUTIES OF THE STATE WATER CONTROL BOARD.

Va Code Ann sec 62.1-27 (1968).

Descriptors: *Virginia, *Water quality control, *Water pollution control, *Water control, Legislation, Legal aspects, Administrative agencies, Water pollution, Regulation, Investigations, Pollution abatement, Water quality, Standards, Sewage, Industrial wastes, Permits, Fish, Water treatment, Pollutant identification, Damages, Operation and maintenance, Investigations.
Identifiers: *Pollution prevention.

The State Water Control Board has the duty and authority to (1) supervise the administration and enforcement of this chapter, and all standards, policies, regulations, and special orders promulgated thereunder; (2) study, investigate, and make recommendations concerning all state water pollution problems; (3) establish quality standards for waters in relation to the reasonable and necessary use thereof, and policies relating to pollution in keeping with the purposes of this chapter; (4) conduct scientific experiments, investigations, and research to discover economical and practical methods for preventing pollution; (5) issue certificates for the discharge of waste into state waters; (6) insure compliance with its certificates, standards, regulations, and special orders; (7) adopt administrative rules governing its procedure; (8) issue special orders to secure the control, abatement, and prevention of pollution; (9) adopt such regulations as it deems necessary to enforce the general pollution abatement program of the Board; (10) investigate any large scale killing of fish believed or known to have resulted from pollution, bringing a civil action against persons wilfully or negligently responsible for such killings; and (11) administer programs of financial assistance for state political subdivisions for the planning, construction, operation, and maintenance of water quality control facilities. (Keith-Florida)
W70-01170

REGULATION OF SEWAGE DISCHARGE.

Va Code Ann secs 62.1-31 thru 62.1-33 (1968).

Descriptors: *Virginia, *Sewage treatment, *Sewerage, *Sewage disposal, Sewers, Water pollution sources, Water pollution control, Waste disposal, Environmental sanitation, Sewage, Wastes, Governments, State governments, Legislation, Treatment, Administrative agencies, Cities, Regulation, Water quality control, Water pollution.

All sewerage systems and sewage treatment works are under the joint supervision of the State Department of Health and the State Water Control Board. The Department advises cities, towns, sanitary districts, and owners that intend to install sewage treatment works as to the appropriate type of treatment. Owners of treatment works from which sewage is discharged into state waters must furnish the Department, when requested by the Board, information regarding the operation of such facilities. Owners presently discharging sewage into state waters may apply to the Board to continue to do so; however, the present volume and strength of the sewage may not be increased. The Board may not authorize any sewage discharge which would result in the pollution of clean state waters. All new sewerage systems or sewage treatment works designed to serve more than four hundred persons, or which will extend or alter materially such existing systems, must be approved by the Board. (Marsee-Florida)
W70-01171

PENALTIES FOR POLLUTION AND POLLUTION FROM BOATS.
Va Code Ann secs 62.1-43 thru 62.1-44.1 (1968).

Descriptors: *Virginia, *Sewage disposal, *Waste disposal, *Water pollution control, Water pollution sources, Disposal, Environmental sanitation, Sewage, Wastes, Governments, State governments, Legislation, Administrative agencies, Regulation, Legal aspects, Boats, Navigable waters, Nonnavigable waters, Water quality control, Recreation wastes, Pollutants, Water pollution, Administration.

It is unlawful for any owner to cause pollution in state waters contrary to any special order adopted by the State Water Control Board. It is also unlawful to discharge sewage, industrial waste, or other wastes in violation of any condition contained in a sewage disposal certificate issued by the Board. Likewise unlawful is the failure or refusal to furnish information required by the Board. Penalties are herein provided. The Board promulgates regulations for the purpose of controlling the discharge of sewage and wastes from boats into navigable and non-navigable waters. In formulating such regulations, the Board consults with the State Department of Health, the Commission of Game and Inland Fisheries, and the Marine Resources Commission for the purpose of coordinating such rules. (Marsee-Florida)
W70-01172

INTERSTATE COMMISSION ON THE POTOMAC RIVER BASIN.
Va Code Ann secs 62.1-64 thru 62.1-69 (1968).

Descriptors: *Virginia, *Interstate commissions, *Interstate compacts, *Water pollution control, Water pollution, Water quality, Water quality control, Water resources, Interstate, Interstate rivers, Maryland, Pennsylvania, West Virginia, District of Columbia, River basins, Administrative agencies, Legislation, Governments, State governments, Federal government, Leadership, Financing, Coordination, Abatement.

The governor is authorized and requested to execute, on behalf of Virginia, a compact with Maryland, West Virginia, Pennsylvania, and the District of Columbia for the creation of the Potomac Valley Conservancy District. The purpose of such District is the abatement of existing pollution and the control of future pollution in interstate streams. The compact includes provisions for: (1) the creation of the Interstate Commission on the Potomac River Basin; (2) the powers of the Interstate Commission; (3) the financing of the Interstate Commission; and (4) the effective date of the compact. The Potomac River Basin Commission of Virginia is created subject to the execution of the above compact, and the appointment, terms, and qualifications of members are prescribed. The Potomac River Basin Commission of Virginia acts with and as a unit of the Interstate Commission and performs duties as provided by the compact. (Marsee-Florida)
W70-01173

OHIO RIVER VALLEY WATER SANITATION COMMISSION.
Va Code Ann secs 62.1-70 thru 62.1-72 (1968).

Descriptors: *Virginia, *Interstate commissions, *Interstate compacts, *Water pollution control, Water pollution, Water quality, Water quality control, Water resources, Interstate, Interstate rivers, River basins, Administrative agencies, Legislation, Governments, State governments, Federal government, Leadership financing, Coordination, Abatement, Ohio River.

The governor is requested to execute on behalf of Virginia, the Ohio River Valley Sanitation Compact. The purpose of the Compact is to abate existing and control future water pollution in the waters of the Ohio River Valley Basin. The terms and form of the Compact are set forth including: (1) the creation of the Ohio River Valley Water Sanitation District; (2) the creation of the Ohio River Valley Water Sanitation Commission; (3) the composition of the Commission and the selection of commissioners; and (4) the powers and duties of the Commission. It is recognized that no single standard for the treatment of sewage or industrial wastes is applicable in all parts of the district; therefore, the guiding principle of this compact shall be that pollution within a signatory state shall not injuriously affect the various uses of interstate waters. All sewage and industrial wastes entering interstate waters must be treated to the extent necessary to maintain such waters in a sanitary condition at least equal to the condition of the interstate waters immediately above the confluence. The Commission shall recomment uniform water pollution legislation to the signatory states. (Marsee-Florida)
W70-01174

DREDGING SAND AND GRAVEL AND MISCELLANEOUS OFFENSES (WATER POLLUTION)
Va Code Ann secs 62.1-190 thru 62.1-196 (1968).

Descriptors: *Virginia, *Riparian rights, *Dredging, *Water pollution, Pollutants, Water conservation, Fouling, Sands, Gravels, Beaches, Streambeds, Ownership of beds, Navigable waters, Low water mark, Tidal water, High water mark, Oil, Oil wastes, Impaired water quality, Obstruction to flow, Public health, Water pollution sources, Federal government.
Identifiers: Injunctions (Prohibitory), Penalties (Criminal), Penalties (Civil), Dumping garbage.

Dredging of sand or gravel from any part of the fastland, beach, or bluff abutting any river, stream, or other waters within the jurisdiction of the state or from the beds thereof is prohibited. Any person or corporation violating these provisions is guilty of a misdemeanor. The owner of any such fastland, beach, bluff, or bed of stream on which such a deposit exists may obtain an injunction to prohibit such dredging and may recover treble damages for any material removed. These prohibitions do not apply to the owners of such deposits, their licensees, or licensees of the United States. It is unlawful to obstruct or contaminate state waters by dumping garbage or any other substance which may impair the lawful use or enjoyment of them. Any obstruction which exists for more than a week, except a lawfully constructed dam, is prohibited. Contamination or obstruction of certain areas is specifically prohibited. Oil may not be discharged upon or under the navigable tidal waters of the state. Persons renting boats are required to provide a life preserver for each passenger. (Schram-Florida)
W70-01181

NEW ENGLAND INTERSTATE WATER POLLUTION CONTROL COMMISSION.

R I Gen Laws Ann secs 46-16-1, 46-16-2 (1956).

Descriptors: *Rhode Island, *Interstate compacts, *Water pollution control, *New England Interstate WPS Compact, New England, Pollution abatement, Water quality control, Interstate, Interstate commissions, Interstate rivers, Water pollution treatment, Control, Industrial wastes, Standards, Administrative agencies, Financing, Costs, Cost allocation, Cost sharing, Sewage, Regulation.
Identifiers: *Interstate waters.

The Commission on Interstate Cooperation is directed to negotiate with Maine, New Hampshire, Vermont, Massachusetts, and Connecticut the New England Interstate Water Pollution Control Compact. The Compact is to abate existing and control future pollution in the interstate waters of the New England area. Toward this end the New England Interstate Water Pollution Control Commission is created. The membership of the Commission and the procedure for the selection of commissioners is herein set forth along with various powers and duties of the Commission. The Compact recognizes that no single standard of sewage and waste treatment and no single standard of quality of receiving waters is practical. The degree of treatment of sewage and industrial wastes should take into account the classification of the receiving waters according to present and proposed highest use. The Commission is to establish physical, chemical, and bacteriological standards of water quality satisfactory for various classifications of use. Each state will prepare a classification of its interstate waters, and the Commission may make such changes in definitions, classifications, or standards as are necessary for uniformity. Distribution of costs among the signatory states is provided. (Marsee-Florida)

OXYGEN MANAGEMENT AND ARTIFICIAL REAERATION IN THE AREA OF BALDENEY LAKE AND THE LOWER RUHR RIVER (IN GERMAN),
Ruhrverband, Essen (West Germany).
Klaus R. Imhoff.
English summary. Das Gas- und Wasserfach, 109 Jahrg (1968), Heft 34, Seite 936-941 (Wasser-Abwasser).

Descriptors: *Pollution control, *Aeration, *Optimization, Water pollution, Dissolved oxygen, Biochemical oxygen demand, Costs, Oxygenation.
Identifiers: *Instream aeration, Diffuser aerator, Mechanical Aerator, Hydraulic turbine aerator.

The Ruhr River in Germany has presented a major pollution control problem for a long time. Although only a small river, the equivalent of sewage from over 2 million population comes through the central area near the city of Essen. In addition to very strict control of effluents by waste treatment plants, the pollution control agency, the Ruhrverband, has applied instream aeration as a supplemental means. Three aeration methods have been used--by introducing air into hydraulic turbines, by diffusers (bubbling from submerged orifices), and by mechanical aerators. Technical analysis allows an economic comparison as follows. In order to remove organic pollution of one population equivalent, at times of low flow, the cost would amount to 0.81 DM for a mechanical aerator, and 0.22 DM with the turbine aerator, as compared to 4.0 DM for expansion of the treatment plant to achieve the same result. Other figures show the diffuser as much less economic than the mechanical aerator, though part of the extra cost is due to certain special circumstances. This result is in accord with recent American findings that instream aeration is an economical means in severe pollution situations. (Whipple-Rutgers)

06. WATER RESOURCES PLANNING

6A. Techniques of Planning

APPLICATION OF DYNAMIC PROGRAMMING TO THE CONTROL OF WATER RESOURCES SYSTEMS,
Stanford Research Inst., Menlo Park, Calif.
Robert E. Larson, and William G. Keckler.
IFAC, Haifa Symp, Comput Contr Nat Resources Publ Util, p 1-52, Sept 1967. 52 p, 11 fig, 6 tab, 12 ref.

Descriptors: *Dynamic programming, *Water resources development, *Optimization, *Planning, Stochastic processes, Reservoir operation, Approximation method, Hydroelectric power, Irrigation efficiency, Investment, Water demand, Water storage, Control systems.

The applicability of dynamic programming techniques for solving optimization problems that occur in the operation and planning of a water system was examined. Several specialized dynamic programming techniques were introduced. These included forward dynamic programming, successive approximations dynamic programming for stochastic control, iteration in policy space and state increment dynamic programming. Four examples were presented and discussed. Short term optimization of a two reservoir system was solved with the forward dynamic process, short term optimization of a four reservoir system was treated by successive approximations; optimum operation over a year, with streamflows treated a stochastic variables, was determined by iteration in policy space, and optimum long term planning of system additions was treated by forward dynamic programming. Dynamic programming was found to be suitable for solving a wide range of water resource problems extending from hourly control of a system involving hydroelectric power, water storage and irrigation, to a long range optimum investment planning. STOCHASTIC METHODS FOR ANALYZING RIVER BASIN SYSTEMS,
Cornell Univ., Ithaca, N.Y. Dept. of Water Resources Engineering.
Daniel P. Loucks.
Available from the Clearinghouse as PB-187 686, $3.00 in paper copy, $0.65 in microfiche. Research Project Technical Completion Report, Water Resources and Marine Sciences Center, Aug, 1969. 306 p, 39 ref. OWRR Project C-1034.

Descriptors: *Stochastic processes, *Analytical techniques, *River basins, *Linear programming, *Dynamic programming, *Reservoir operation, Simulation analysis, Optimization, Delaware River, Water quality control, Water resources development, Multi-purpose reservoirs.
Identifiers: Targets, Operating policies.

A variety of stochastic linear, nonlinear and dynamic programming methods are presented for the preliminary selection of alternative water

resource system designs and operating policies. Emphasized is the influence of hydrologic risk on water resource planning. The optimism inherent in the results of most river basin system analyses that do not explicitly consider at least some of the variability of streamflow is illustrated through numerous applications of the models to both simple and complex examples. Three types of stochastic models are compared for defining sequential operating policies for a multipurpose reservoir. In situations where capacities and targets are not variables, dynamic programming is shown to be a very efficient method for defining operating policies. Water quality (DO, BOD) control by wastewater treatment and flow augmentation is examined from a regional multi-objective viewpoint. A detailed optimization-simulation study of the Delaware River basin illustrates the efficiency of both deterministic and stochastic optimization models for use in the preliminary selection of design and operating alternatives for further analysis by simulation.

H. J. Day, G. Bugliarello, P. H. P. Ho, and V. T. Houghton.
Water Resources Res, Vol 5, No 5, p 937-946, Oct 1969. 10 p 7 fig, 3 tab, 15 ref.

Descriptors: *Flood protection, *Non-structural alternatives, *Cost-benefit analysis, *Warning systems, Flood damage, Cost analysis, Flood plain zoning, Flood proofing.
Identifiers: Flood warning systems.

Benefits due to a flood warning system are estimated by using individual structure stage damage curves for several warning periods. Typical stage damage warning time data for residence, a grocery supermarket, and a railroad switchyard serve as examples for benefit evaluation. The application of these concepts to 650 residences involved in the 1959 flood at Meadville, Pennsylvania, indicated that reducible damages represent approximately one-third of the total residential damage. Both evacuation and temporary floodproofing, two non-structural alternatives used frequently, may be evaluated more explicitly by this method. (Knapp-USGS)

The history of water law and the development of the three distinct theories of riparian rights, prior appropriation, and administrative appropriation are briefly reviewed. Despite differing legal heritages, both France and the Eastern United States adopted the riparian theory. Both recognize different forms of water - stream, underground, and surface - and attach specific rights to each. These areas are discussed and water rights in respect to each area are compared. The discussion of streams comprehensively covers: (1) public streams; (2) non-public streams; (3) riparian land; (4) riparian rights; (5) industrial uses; (6) police power of the state; and (7) other characteristics of riparian rights. Similarities and differences in these areas are illustrated through reference to both statutory and case law. The author concludes that the quantity of available water was responsible for adherence to the riparian theory, and an equitable working of the system was provided through checks and balances involving reasonable use. Imminent water shortages, brought about by industrial use, seem to require more administrative control in each country. (Schram-Florida)

PRIVATE WATER RIGHTS IN FRANCE AND IN THE EASTERN UNITED STATES,
Ludwik A. Teclaff.
Am J Comp L, Vol 11, No 4, p 560-564, Autumn 1962. 5 p, 15 ref.

Descriptors: *Riparian rights, *Prior appropriation, *Navigable waters, *Non-navigable waters, Ownership of beds, Streams, Civil law, History, Public rights, Foreign waters, Foreign countries, Legal aspects, Water law, Beds, Stream beds, Administration, Interstate rivers, Underground Streams, Surface waters.
Identifiers: *Common law, Foreign water law, France.

By the 19th century, water law had begun to crystallize into three distinct types: (a) riparian rights, limiting the right of water use to the owners of adjacent lands; (b) prior appropriation, giving this right to the first user; and (c) administrative apportionment, placing the disposition of water in the hands of the government. None of these doctrines is peculiar to either common law or to civil law. The most important factor in adopting one type of law is the quantity of water available. Both France and the Eastern United States adhere to the riparian rights doctrine. Major changes in French water law have been made by statutes. In the United States, water law has developed primarily through judicial decisions. Both France and the United States use navigability to determine whether streams are public or subject to private ownership. In France, public ownership is determined today by administrative enumeration while American courts generally still use the navigability test. Riparian owners in France have the same right to public streams as the general public, but in the United States such rights are only subject to the rights of the public and of navigation. Under both systems ownership of beds of non-public streams is accorded to the riparians. (Schram-Florida)

PRIVATE WATER RIGHTS IN FRANCE AND IN THE EASTERN UNITED STATES,
Ludwik A. Teclaff.
Am J Comp L, Vol 11, No 4, p 564-569, Autumn 1962. 6 p, 17 ref.

Descriptors: *Riparian rights, *Riparian land, *Natural flow doctrine, *Reasonable use, Industrial water, Hydroelectric power, Remedies, Relative rights, Obstruction to flow, Mill dams, History, Public rights, Non-navigable waters, Navigable waters, Competing uses, Legal aspects, Water law, Ownership of beds, Usufructuary right.

The water of non-public streams is not subject to ownership, hence owners of riparian land have only limited rights to it. In both countries, land must touch the stream at some point to be classified as riparian. In other respects, the French and American systems differ considerably in their definition of riparian land. In relation to riparian rights, American jurisdictions utilize either the natural flow doctrine or reasonable use theory. The French system resembles more the doctrine of reasonable use since no hierarchy of uses is established. French and American riparian rights differ in the treatment of non-navigable streams as sources of power. In France, the administration may award licenses to non-riparians on payment of compensation to dispossessed riparian owners. Riparian rights in both countries are limited by the police power of the state. In France this is vested in the administration. In the United States, the Federal Constitution poses the problem of states limiting property rights for the public welfare. It appears that the states have ample latitude in this field. Riparian rights are protected in France by possessory action and in the United States by action for damages and injunction. (Schram-Florida)

PRIVATE WATER RIGHTS IN FRANCE AND IN THE EASTERN UNITED STATES,
Ludwik A. Teclaff.
Am J Comp L, Vol 11, No 4, p 569-573, Autumn 1962. 5 p, 8 ref.

Descriptors: *Underground streams, *Percolating water, *Surface waters, *Water rights, Confined water, Riparian rights, Subsurface waters, Beneficial use, Domestic water, Industrial water, Irrigation water, Prior appropriation, Reasonable use, Natural flow doctrine, Remedies, Prescriptive rights, Riparian waters, Water law.
Identifiers: *Common law.

French law makes no distinction between the various forms of underground water. In the United States underground streams flowing in a definite channel are distinguished from the various forms of percolating water. In the United States the reasonable use theory is replacing the common-law notion that the owner of the overlying land had full ownership of the underground water. The French law is similar to the laws of those states that follow the common-law rules, mitigated by the exclusion of malicious uses. Both systems give the landowner full ownership of surface waters. In the United States, such water is treated as part of the land, whereas in France it becomes an object of ownership only upon capture. French water law and its counterpart in the eastern United States developed in regions where water is comparatively abundant. As long as the water was used mainly for domestic purposes and for irrigation, the riparian system worked well. But it proved inadequate when industrial uses of water began. In both countries development seems to point in the same direction--toward more administrative control. (Schram-Florida)

NOTES ON WATER WORKS LAW SECOND INSTALLMENT - IRRIGATION AND RIPARIAN RIGHTS,
John H. Murdock, Jr.
Water and Sewage Wks, Vol 102, No 1, p 12-18, Jan 1955. 7 p.

Descriptors: *Irrigation, *Riparian rights, *Legal aspects, *Reasonable use, Alteration of flow, Artificial use, Natural use, Competing uses, Natural flow doctrine, Obstruction to flow, Relative rights, Remedies, Riparian land, Riparian waters, Usufructuary right, Water law, Water utilization, Judicial decisions, Streams, Rivers, Irrigation water, Water rights, Water supply.

Irrigation may cause a threat to public water supplies. The downstream riparian owner has a right to the unimpeded flow of the stream, while the upland riparian owner has the right to reasonable use of the water. Court decisions have recognized the right to use the water for irrigation if the use is not unreasonable. The criteria is whether the water flowing to the lower owner's land has been materially diminished. Several cases have held that where the water supply is not sufficient to provide for competing natural riparian uses and also irrigation,

then irrigation would be an unreasonable use. The common law rule is that water may not be diverted to irrigate non-riparian land because this is not a riparian right. The size of the stream involved will be very relevant to the issue of whether irrigation is a reasonable use. Once a right to irrigate is established as reasonable it may only be stopped by the acquisition of the riparian right itself. Eminent domain may be used to acquire such a right if it is required for the public water supply. Unreasonable diversions may be enjoined. (Darragh-Florida)

REAL PROPERTY--RIPARIAN GRANTS--LEGISLATIVE LIMITATIONS ON EXTENT OF GRANT.
Rutgers L Rev, Vol 10, No 4, p 738-741, Summer 1956. 4 p.

Descriptors: *New Jersey, *Tidal waters, *Administrative agencies, *Ownership of beds, Bulkhead line, Legislation, Judicial decisions, Bays, Riparian land, Land tenure, Equitable apportionment, Legal aspects, Water zoning, Administration, Competing uses, Water allocation (Policy), Regulation, Zoning, Beds, Land, Landfills, Land forming, Piers, Bulkheads, Structures.
Identifiers: *Submerged Land Grants.

Bailey v Driscoll, 19 NJ 363, 117 A2d 165 (1955), which involved the grant of lands formerly under Barnegat Bay, presents the problem of determining the limitations placed by the New Jersey legislature upon the extent of such grants. Enactments concerning riparian grants of submerged and formerly submerged lands are in a confused state because of such grants' piecemeal enactment. One series of acts limits grants to 'exterior lines', apparently meaning bulkhead or pier lines beyond which it is unlawful to erect and maintain any structure. Another series of acts, by 'exterior lines', appears to mean a demarcation line beyond which there can be no obstruction of navigation. Also, by virtue of these acts, the Council of the Division of Planning and Development is simultaneously limited to exterior lines in granting lands and given the power to establish such lines. The Supreme Court properly held in the instant case that the Council could grant lands to the extent of the established exterior lines. How far outward into the water exterior lines may be established was not decided, although it appears from the statutes that such lines shall not interfere with public navigation. (Marsee-Florida)

GOVERNMENTAL TECHNIQUES FOR THE CONSERVATION AND UTILIZATION OF WATER RESOURCES: AN ANALYSIS AND PROPOSAL.

Yale L J, Vol 56, No 2, p 276-303, Jan 1947. 28 p, 125 ref.

Descriptors: *Water resources development, *Water conservation, Water utilization, *Federal government, Federal-state water rights conflicts, Watersheds (Basins), State governments, Interstate commissions, Interstate compacts, Interstate rivers, River basins, Drainage, Watershed management, Port Authority of New York, Tennessee Valley Authority Project, Administrative agencies, Legislation, Water control.
Identifiers: Regional drainage projects.

The scarcity of water in the arid and semi-arid regions of the United States, coupled with the interstate character of drainage basin problems, has produced a demand for effective federal-state water control and regional development. Federal administrative techniques have led to the dispersal of water problems among different departments leading to jurisdictional disputes and duplication of functions. Interstate compacts are also inhibited by jurisdictional disputes, state constitutional limitations, lack of funding, and lack of coercive authority. The success of the Tennessee Valley Authority and the Port of New York Authority illustrates that proper delegation of federal and state power can be effectively merged. The nation requires a national corporation created by Congress and the negotiation of interstate compacts delegating important state powers over water resources to the corporation. The corporation will operate on a regional basis cooperating with and coordinating federal and state authority to develop an effective drainage basin program. (McDonough-Florida)

GOVERNMENTAL TECHNIQUES FOR THE CONSERVATION AND UTILIZATION OF WATER RESOURCES: AN ANALYSIS AND PROPOSAL.

Yale L J, Vol 56, No 2, p 276-288, Jan 1947.

Descriptors: *Water resources development, *Watersheds (Basins), *River basin development, *Administrative agencies, Tennessee Valley Authority Project, Interstate rivers, Interstate commissions, State jurisdiction, Federal jurisdiction, Legislation, Watershed management, Water rights, Water utilization, Regulation, Federal government.
Identifiers: Regional drainage projects.

The effective regulation and development of a river basin area is inhibited by the interstate character of the basin drainage problem. Traditionally the Supreme Court has acted as the arbiter of interstate water disputes on a case by case basis. The federal government utilizes the war power, treaty power, and the commerce clause for national programs for navigation improvement, flood control, and power production. Administration of national policy is further divided among the departments of Agriculture, Interior, State, and Treasury in divergent water control activities. The absence of an organizational pattern of nation-wide machinery for coordinating plans has led to duplication of functions and jurisdictional disputes within departments. One method to escape this federal compartmentalizing of responsibility has been the Congressional creation of regional valley authorities. The success of the Tennessee Valley Authority as a single governmental agency of all federal authority and responsibility provides a working model. The Authority depends on state cooperation through permissive legislation and modification of existing doctrines of water rights to comply with federal plans. (McDonough-Florida)

GOVERNMENTAL TECHNIQUES FOR THE CONSERVATION AND UTILIZATION OF WATER RESOURCES: AN ANALYSIS AND PROPOSAL.

Yale L J, Vol 56, No 2, p 289-30-3, Jan 1947.

Descriptors: *Water resources development, *Federal-state water rights conflicts, *River basin development, *Watersheds (Basins), Interstate commissions, Interstate compacts, Legislation, Administrative agencies, Federal jurisdiction, State jurisdiction, Watershed management, Interstate rivers, Drainage, Federal government, Projects.
Identifiers: Regional drainage projects.

Many states fear federal encroachment by consenting to regional authorities and prefer to use interstate planning commissions, interstate compacts, and interstate public authorities. The interstate planning commission lacks coercive authority, funds, and may be foiled by the recalcitrance of a single state. Interstate compacts have the inherent limitations of federal and state constitutions and stress political compromise over effective water planning. The interstate public authorities closely resemble the regional valley concept in that the states agree to vest authority into one corporate body for continuous administrative supervision. This system is subject to the veto by the governor of each participating state, and all new major projects must be authorized by the state legislatures involved. The solution is the creation by Congress of a national corporation and the negotiation of interstate compacts giving the corporation a delegation of important state powers over water resources. The fusion of national and local power into a single agency and the passing of state enabling legislation will provide an effective means of solving the problem of river basin drainage. (McDonough-Florida)

CANALS AND WATERWAYS (UPPER MISSISSIPPI RIVERWAY COMPACT).

Ill Ann Stat ch 14, sec 1101, art V, 'Powers', (Smith-Hurd Supp 1969).

Descriptors: *Illinois, *Water resources planning, *Interstate commissions, *Interstate compacts, Mississippi River, Administrative agencies, Legislation, Regulation, Public benefit, Water resources, Natural resources, Land resources, Administration, State governments, Management, Water policy, Parks, Recreation, River basin development, Water resources development, Water pollution, Water quality control, Erosion control, Planning, Diversion.

The Upper Mississippi Riverway Compact, which establishes the Upper Mississippi Riverway District and the Upper Mississippi Riverway Commission, confers certain powers on the Commission. These include the power to conduct studies and develop recommendations for the present and future protection, use, and development in the public interest of the river valleys and waters in, adjacent to, and affecting the Upper Mississippi Riverway District with respect to: (1) joint regional planning for the development of such areas; (2) measures for controlling water pollution, maintaining water quality, and controlling water use; (3) programs for control of soil and river-bank erosion and the general improvement of the river basins; and (4) diversion of waters to and from the rivers. The Commission and its properties are not subject to taxation. The Commission may provide coordinated services to two or more parks and may open its facilities to the public. The Commission must submit a budget to the appropriate state officer and may not pledge the credit of any party state. The Commission may regulate land and water resources. Nothing in the Compact limits the jurisdiction of any party state or federal government. A party state may withdraw from the Compact by payment of fair value and reacquire all real property located within the state. (Moulder-Florida)

TOMBIGBEE - TENNESSEE WATERWAY DEVELOPMENT COMPACT.
Miss Code Ann secs 5956-45 thru 5956-48 (Supp 1968).

Descriptors: *Mississippi, *Interstate compacts, *Interstate rivers, *Interstate commissions, Cooperatives, Governments, State governments, Water policy, Water resources development, Tennessee River, Alabama, Kentucky, Tennessee, Florida, Rivers, Channels, Construction, Administrative agencies, Federal government, Legislation, Planning, Navigation, Coordination, Navigable waters.

The compact's purpose is to promote the development of a navigable waterway connecting the Tennessee and Tombigbee rivers so as to provide a navigable channel and create a joint interstate authority between Alabama and Mississippi. The party states shall create the Tennessee-Tombigbee Waterway Development Authority, the purpose of which is the promotion and coordination of said waterway. The Authority is empowered to hold hearings, conduct studies and surveys, acquire necessary land, cooperate with all concerned groups or agencies, coordinate representation and support in Congress, and exercise all powers appropriate to these purposes. Financial contribu-

ions of each party state are in the proportion its population bears to the total population of all party states. Tennessee, Kentucky, and Florida are admitted as party states. (Darragh-Florida)

POLLUTION--CAUSES, COSTS, CONTROLS.

Chem Eng News, p 33-68, June, 1969. 18 p, 13 fig.

Descriptors: Air environment, *Air pollution, *Atmospheric pollution, Manufacturing, Environment, Environmental sanitation, Wastes, Industrial wastes, Contamination, Waste treatment, Waste water (Pollution), *Water pollution, Water quality, Water quality act, *Water pollution control, Water pollution sources, Costs, *Pollution abatement, Legislation.
Identifiers: *Air pollution control, Exhaust gases, *Pollution control.

The principal causes of air and water pollution, the costs of pollution abatement, and the legislative and enforcement measures taken by various levels of government to control the environment are reviewed. Important technological developments and actions taken by industry to halt pollution are included. The increasing magnitude of the problem is caused by 2 main factors: urbanization and technical advance. Today's water pollution problems are much different than the typhoid fever problems a few decades ago; the problems today are concerned with synthetic chemical contaminates. The Federal Water Pollution Control Administration estimates that at least $26 billion will be needed to bring lakes and streams up to water quality standards by 1973. Federal, state, and local air and water pollution programs are discussed. Federal legislation on air and water pollution is reviewed. A resume is included of the Manufacturing Chemists Association report on the activities of the chemical manufacturing industry to control pollution. A directory is given of companies offering equipment, products, services, or supplies for use in pollution control. (USBR)

RIPARIAN WATER RIGHTS V A PRIOR APPROPRIATION SYSTEM: A COMPARISON,
Charles M. Haar, and Barbara Gordon.
Boston U L Rev, Vol 38, No 2, p 207-255, Spring 1958. 49 p, 50 ref.

Descriptors: *Riparian rights, *Prior appropriation, *Water rights, *Massachusetts, Water utilization, Water law, Legislation, Riparian land, Priorities, Water users, Surface-groundwater relationships, Surface waters, Groundwater, Legal aspects, Reasonable use, Riparian waters, Prescriptive rights, Administrative agencies.

A riparian state like Massachusetts needs to evaluate its own riparian system before discarding or modifying it in favor of a revision of water rights under a prior appropriations system. A proposed Michigan statute adopting a prior appropriation system and the present Massachusetts riparian system based upon common law traditions, case law, and statutes provides a basis for an initial comparison of the two systems, including discussions of watercourses, surface water, riparian land, appurtenant water rights, abandonment of water rights and groundwater. The adoption of a prior appropriation system in Massachusetts would have the effect of changing the present law, rather than merely declaring the law with the probable result of changing various property rights and obligations. A change from the riparian rule of 'reasonable use' to a prior appropriation system would also prove to be a costly solution without sufficient benefits over the present system. The seeming virtues of a fixed appropriation system should not be held as necessarily superior to a system of administrative and case determination of water rights. An analysis of water problems under the present system is preferred over the adoption of a different system. (McDonough-Florida)
W70-01139

RIPARIAN WATERS RIGHTS V A PRIOR APPROPRIATION SYSTEM: A COMPARISON,
Charles M. Haar, and Barbara Gordon.
Boston U L Rev, Vol 38, No 2, p 208-235, Spring 1958.

Descriptors: *Massachusetts, *Riparian rights, *Prior appropriation, *Water users, Water rights, Water law, Riparian waters, Reasonable use, Priorities, Water utilization, Legislation, Legal aspects, Riparian land, Prescriptive rights.

Massachusetts' riparian law is compared with a proposed Michigan prior appropriation statute to determine if the Commonwealth should adopt that system. The Michigan statute divides water rights into Class A riparian rights and Class B appropriative rights. Class B water users apply to a commission to obtain water priority rights. The Massachusetts riparian doctrine gives each riparian the right to reasonable use of all water available unless his right is enlarged or diminished by grant or prescription. This method allows a fundamental equality among claimants lacking in the prior appropriation system. Courts consider all circumstances to determine reasonable use as no lawful use is unreasonable per se. Courts must, however, await suits prior to determining water rights. Massachusetts Mill Acts provide for competing use of streams for power purposes without giving fixed priorities. This provides an amalgamation of statutory prior appropriation and common law reasonable use. The Michigan proposal would change Massachusetts law by limiting possible claimants to Class A owners without protecting non-riparian prescriptive users. (McDonough-Florida)
W70-01140

RIPARIAN WATER RIGHTS V A PRIOR APPROPRIATION SYSTEM: A COMPARISON,
Charles M. Haar, and Barbara Gordon.
Boston U L Rev, Vol 38, No 2, p 235-239, Spring 1958.

Descriptors: *Massachusetts, *Riparian rights, *Prior appropriation, *Water rights, Groundwater, Surface-groundwater relationships, Surface waters, Priorities, Water users, Reasonable use, Riparian waters, Prescriptive rights, Water law, Legal aspects, Legislation, Diversion.

The Michigan proposal defines 'watercourse' as a natural stream in a definite natural channel. The Massachusetts definition is similar but includes man-made channels within the 'natural' category. The adoption of the Michigan section would be a codification of case law rather than a modification but may in fact exclude non-natural watercourses. Michigan defines surface water as occurring naturally on the surface of the ground rather than watercourses, lakes, or ponds. Although the term is not explicitly defined by Massachusetts' decisions, the concept is identical. A recitation of illustrative instances is a better view. Michigan views riparian land as the smallest tract held under one title in the chain leading to the present owner. Massachusetts considers land abutting a watercourse as riparian and does not attempt to limit the term in area. The Michigan proposal would limit water use to an amount for reasonable beneficial use and requires application and approval prior to any lawful diversion. Massachusetts allows all riparians any reasonable use not injuring others and allows the taking of prescriptive rights to water use. The Michigan proposal would change present law. (McDonough-Florida)

RIPARIAN WATER RIGHTS V A PRIOR APPROPRIATION SYSTEM: A COMPARISON,
Charles M. Haar, and Barbara Gordon.
Boston U L Rev, Vol 38, No 2, p 239-255, Spring 1958.

Descriptors: *Massachusetts, *Riparian rights, *Prior appropriation, *Administrative agencies, Water rights, Water law, Judicial decisions, Prescriptive rights, Riparian land, Legal aspects, Water law, Legislation, Reasonable use, Riparian waters, Water users, Planning.

Many of the advantages in a prior appropriation system lie in the nature of administrative agency determinations as contrasted with judicial determinants under a riparian doctrine. Agencies presume expertise, but Massachusetts also utilizes expertise by appointing a 'master' in water law cases. Although the prior appropriation fixes a quantity of water to be used indefinitely, it lacks the flexibility of judicial determinations. It doesn't follow that the repudiation of the riparian system in favor or a prior appropriation system will solve Massachusetts' problems. Massachusetts needs to gather more data on all phases of water law and appoint commissions to develop a series of comprehensive plans on water needs upon which courts can base their decisions. PEARL RIVER BASIN DEVELOPMENT DISTRICT ACT.
Miss Code Ann secs 5956-251 thru 5956-253, 5956-255 thru 5956-258, 5956-260, 5956-261, 5956-269 (Supp 1968).

Descriptors: *Mississippi, *River basins, *Administrative agencies, *Water resources development, Rivers, Taxes, Financing, Tax rates, Leadership, Legislation, State governments, Federal government, Overflow, Dams, Erosion control, Floodwater, Flood protection, Flooding, Flood control, Recreation facilities, Parks, Appropriation, Eminent domain, Forests, Soil conservation, Tributaries.
Identifiers: *River basin districts.

To conserve, store, and regulate the waters of the Pearl River and its tributaries and their overflow waters, this act authorizes the organization of the Pearl River Basin Development District. The Act provides for the selection and composition of a board of directors for such District and establishes procedures for the District's creation. Counties becoming members of the District are required to make annual payments thereto from funds raised by special tax levy. Numerous powers are given the District, including the power: (1) to impound and appropriate overflow and surface waters of the Pearl River and its tributaries; (2) to forest and reforest; (3) to prevent soil erosion; (4) to acquire lands by condemnation; (5) to require relocation of roads, railroads, power lines, and other named facilities; (6) to inundate public lands; (7) to establish and operate necessary facilities; and (8) to establish public parks and recreation facilities. The Act further gives the board of directors power to promulgate regulations for the District and set forth penalties for violations thereof. The District may also borrow money and issue bonds. (H R Marsee-Florida)
W70-01157

PEARL RIVER BASIN DEVELOPMENT DISTRICT ACT.

Miss Code Ann secs 5956-251 thru 5956-253, 5956-255, 5956-256 (Supp 1968).

Descriptors: *Mississippi, *River basins, *Administrative agencies, *Water resources development, Soil conservation, Rivers, Taxes, Tax rate, Financing, Leadership, Legislation, State governments, Overflow, Erosion control, Dams, Floodwater, Flood protection, Flooding, Flood control, Recreation facilities, Parks, Forests, Forestry, Tributaries, Water pollution control, Pollution abatement.
Identifiers: *River basin districts.

The Pearl River Basin Development District is created to conserve, store, and regulate the waters and overflow waters of the Pearl River and its tributaries for: (1) commercial, municipal, industrial, agricultural, and manufacturing purposes; (2) recreational uses; (3) flood control; (4) timber development and irrigation; (5) navigation; (6) soil conservation; and (7) pollution abatement. All powers of the District shall be exercised by a board of directors to be selected and composed as herein provided. Any county may, through its board of supervisors, become a member of the District. Counties becoming members of the District are required to make annual payment thereto from funds raised by special tax levy. (Marsee-Florida)

FEDERAL WATER RESOURCES DEVELOPMENT.

Va Code Ann secs 62.1-148 thru 62.1-152 (1968).

Descriptors: *Virginia, *Local governments, *Water resources development, *Federal government, Flood control, River and Harbors Act, Rivers, Harbors, Easements, Right-of-way, Eminent domain, Condemnation, Dams, Roads, Spillways, Leases, Pipelines, Dikes, Drains, Dredging, Cutoffs, Federal project policy, Projects.

The governing body of any county, city, or town may assure the federal government of fulfillment of the required items of local cooperation that are conditions precedent to the accomplishment of river and harbor flood control projects of the United States. Such assurances, by resolutions or ordinances, may irrevocably bind such county, city, or town: (1) to provide lands, easements, or rights-of-way; (2) to alter existing structures on such areas; (3) to dredge areas not covered by the federal project when required; (4) to construct and maintain public wharves, roads, and marine railways; (5) to remove sewer pipes and submarine cables; (6) to hold the United States harmless against claims for damages; and (7) to provide any other conditions of local cooperation required in the pertinent congressional document. To comply with such terms of local cooperation, the necessary lands may be acquired by lease, purchase, gift, or condemnation. This chapter shall be liberally construed. (Schram-Florida)

WATER POWER AND RESOURCES.
Va Code Ann secs 10-113 thru 10-113.2, 10-115 thru 10-117.1 1964.

Descriptors Virginia, Water resources development, Administrative agencies, Hydroelectric power, Artesian wells, Conservation, Water resources, Resources, Control, Water supply, Surveys, Industrial water, Farms, Seasonal, Streams, Rivers, Water storage, Legislation, Resource development, Industries, Fluctuation, Administration.

In the Department of Conservation and Development there shall be a Division of Water Resources. The Commissioner of Water Resources shall exercise all powers conferred upon him by law, including those in relation to water power, resources, development, and control. The Director of Conservation and Development shall take evidence and report findings concerning conservation of the state's water supply. He shall gather and disseminate information relative to the water powers and industrial advantages in this state. To promote the systematic development of such industrial resources, a comprehensive water power survey shall be made showing the resources and commercial needs of hydroelectric power for community or farm purposes. Such survey shall include the extent of the water powers suitable for profitable use, both developed and undeveloped, the maximum and minimum power available according to seasonal flow of various streams, the possible uses of water storage and conservation, and the advantages of interconnecting hydroelectric systems. The owner of any artesian well shall secure the mouth of such well so as to prevent the waste of any water. Smith-Florida

Arizona Review, Vol 17, No 3, p 1-8, Mar 1967. 8 p.

Descriptors: *Arid lands, *Water resources development, *Water allocation (Policy), *Urbanization, *Consumptive use, Evapotranspiration control, Desalinization, Economics, Irrigation, Industrial water, Social aspects, Water rates, Technology.

This paper is based on a lecture delivered by Dr. White at the University of Arizona in 1960. The author states that one-third of the earth's surface is arid. New pressures on arid lands set the scene for unprecedented social and technical changes. New technology is rapidly advancing the finding, lifting, storing, conveyance, and treatment of water. Urbanization is leading to industrial growth and demand for water. In many areas consumptive use has approached the potential supply. Still, large volumes are annually lost to evaporation and transpiration. In Asia and Africa much irrigated land is lost to water logging and salinization even as new lands are developed. Better use of present irrigation water is needed. A change in public attitude is required to set fair prices that will force rational reallocation of existing water supplies, develop methods for equitable transfer, and make more rational decisions on new investment in water development. New emphasis in technology may be needed: investment in research to reduce evapotranspiration losses may be a better alternate than new salt-water conversion works which have application only to limited areas. THE ASWAN HIGH DAM,
Texas Univ., Austin.
Robert K. Holz.
Professional Geographer, Vol 20, No 4, p 230-237, July 1968. 8 p, 2 tab, 3 fig, 7 ref.

Descriptors: *Arid lands, *Dam Construction, *Land reclamation, *Reservoir evaporation, *Population, Irrigated land, Reservoir leakage, Multi-purpose projects, Economic impact, Social impact, SCIENCE IMPACT, Benefits.
Identifiers: *Aswan Dam, *United Arab Republic, *Nile Valley.

Egypt has tied much of their hope for political, social, and economic development to construction of the High Aswan Dam. There is little doubt that it will be completed on schedule in 1970 or earlier. However, recent studies have revised downward the estimated area that may be brought under irrigation as a result of availability of only marginal land, and uncertainties as to evaporative and seepage losses. However, there should be at least a 25% increase in cultivated land (1.5 million acres) and a doubling of national output of electricity as well as flood and navigation benefits. Aggregate income will increase but because of a rapidly increasing rate of population growth, per capita effects may be negligible among the masses of fellaheens. While a step in the right direction, the High Aswan Dam is not a panacea for Egypt's economic ills. (Crouse-Arizona)

OASES FOR THE FUTURE,
Rochester Inst. of Tech., N.Y.
Kenneth Hickman.
Ekistics, Vol 23, No 137, p 193-198, 1967. 6 p.

Descriptors: *Water resources development, *Water shortage, *Water supply, Desalination plants, *Reclaimed water, Water conveyance, Weather modification, Water waste treatment, Water reuse, Municipal water, Costs, Consumptive use.
Identifiers: *Oases.

This is a general review of the world's water 'problem' and possibilities for its solution. On the average the world's supply of fresh water is sufficient to meet world population needs for the forseeable future. The regional situation is very different - one in which much of the world is now or will soon be short of fresh water because of pollution of existing supplies or poor distribution of precipitation resulting in aridity. Aside from the apparently limited possibilities of weather modification, water can be reclaimed on site or redistributed by conveyance or saline water can be converted. In most cases cost becomes lower as the size of the project becomes larger. Hence, emphasis is on large scale projects for integrated areas. Since most water needs remain local, a real need exists for development of small, packaged units to convert or reclaim water. (Crouse-Arizona)

6D. Water Demand

DYNAMIC ASPECTS OF URBAN WATER DEMAND,
Colorado School of Mines, Golden.
Steve H. Hanke.
Proc, Fourth Amer Water Resources Conf, NY, p 642-650, Nov 1968. 9 p, 1 fig, 1 tab, 18 ref.

Descriptors: *Mathematical models, *Optimization, *Design, *Water demand, *Planning, Water supply, Annual, Average, Seasonal, Rates, Distribution systems, Treatment, Water distribution (Applied), Municipal water.
Identifiers: Dynamic Model.

The problem of how to best manage urban water resources was discussed. The purpose of the paper was to present economic principles and techniques that would aid water managers when planning for optimal use of urban water resources. Designs based on the water 'requirements approach' ignored factors that could cause the demand function to shift or could induce movements along the function. The problem of optimally designing in detail the basic source, transmission treatment and local distribution components of an urban water supply could be tackled better if the following characteristics were known and understood: (1) average annual rate of demand; (2) seasonal average rates of demand; (3) the range of variation in the rates of demand; and (4) the frequency with which peak demands occur. A dynamic mathematical model for optimally designing and investing in urban water resources was developed and recommended over static approach design models. (Thiuri-Cornell)

THE DILEMMA OF WATER RECREATION AND A SUGGESTED SOLUTION,
G. Graham Waite.
Wis L Rev, Vol 1958, No 4, p 542-609, July 1958. 58 p, 248 ref.

Descriptors: *Wisconsin, *Recreation facilities, *Lakes, *Competing uses, Water rights, Riparian rights, Land tenure, Reasonable use, Relative rights, Water utilization, Recreation demand, Water demand, Public health, Access routes, Land use, Non-consumptive use, Water allocation (Policy), Legal aspects, Judicial decisions, State governments, State jurisdiction, Federal jurisdiction, Navigable waters, Public rights.
Identifiers: *Lake management programs.

Pressures on state recreational facilities have created an urgent need for government action. Direct state management of navigable lakes is a possible solution to the problem of providing better facilities. Difficulties with the plan involve its apparent conflict with certain provisions of both the Northwest Ordinance of 1787 and the Wisconsin Constitution. A further problem is the extension of the trust theory, which provides that the state holds public rights in navigable waters in trust for the people of the state, to cover use of riparian lands owned by private persons for public access to navigable lakes and taxation of private riparian owners who use public waters exclusively. The author contends that the Northwest Ordinance is inapplicable today and that the government would not be violating the state constitution's general prohibition against state construction of internal improvements by managing navigable lakes. The state has a affirmative duty as trustee of public waters to promote public rights, and according to the author this justifies interference with private riparian lands. (Kelly-Florida)
W70-00930

THE DILEMMA OF WATER RECREATION AND A SUGGESTED SOLUTION (PART I),
G. Graham Waite.
Wis L Rev, Vol 1958, No 4, p 542-567, July 1958.

Descriptors: *Wisconsin, *Lakes, *Recreation facilities, *Access routes, State jurisdiction, Federal jurisdiction, Navigable waters, Public health, Recreation, Water resources, Water allocation (Policy), Legal aspects, Land tenure, Compensation, Condemnation, Water management (Applied), Water conservation.

Increasing population, increasing amounts of leisure time available to the working public, and a growing reluctance on the part of owners of private lakes to open them to public use have combined to render the state's water recreational facilities inadequate to meet the needs of its citizens. Comprehensive lake management by the state is suggested as a method of solving this problem. Some question exists regarding the state's ability to require payment for use of public waters, or to tax riparian owners who use navigable waters while excluding the public because of a prohibition of interfering with navigable waters and of taxing for their use contained in the Northwest Ordinance of 1787. It is uncertain whether the ordinance survived Wisconsin's admission into the Union, since it applied to the federal territories. Wisconsin's treatment of the ordinance has been ambiguous, but an interpretation that the ordinance is no longer applicable could be drawn from case law. The author submits that water conservation and allocation of water use, in a comprehensive scheme of navigable waters management rendering recreational facilities available to a greater number of persons, may receive favorable consideration in the courts. (Kelly-Florida)
W70-00931

THE DILEMMA OF WATER RECREATION AND A SUGGESTED SOLUTION (PART II),
G. Graham Waite.
Wis L Rev, Vol 1958, No 4, p 567-609, July 1958.

Descriptors: *Wisconsin, *Lakes, *Riparian rights, *Recreation facilities, Relative rights, Compensation, Reasonable use, Recreation, State jurisdiction, State governments, Judicial decisions, Water allocation (Policy), Navigable waters, Federal jurisdiction, Public health, Legal aspects, Recreation demand, Public rights, Water conservation, Water management (Applied).

The feasibility of a plan of state management of navigable lakes for recreational purposes depends in part upon the state's power to interfere with a riparian owner's use of his property without paying compensation. The author urges the courts to uphold this power, pointing to the present uncertainty in Wisconsin case law concerning both the riparian owners' exclusive access rights to adjoining navigable waters and the need for compensation of riparian owners for the kind of interference with their lands that a lake management program would require. The state constitutional prohibition against internal improvements being carried out by the state may impede the development of lake-management projects sponsored by the state. An exception to this rule is that the state may provide internal improvements in performing one of its governmental functions. Preservation and promotion of public rights in public waters can be construed as a governmental function under the trust theory because the trust in which the state holds navigable waters for the people is an active one and also because providing recreational facilities promotes public health. The author further urges state university projects on publicly-owned riparian land and comprehensive land use zoning to further the management plan. (Kelly Florida)

GOVERNMENTAL RESTRICTION OF WATER USE,
Charles N. Huber.
Wis L Rev, Vol 1959, No 2, p 341-346, Mar 1959. 6 p, 34 ref.

Descriptors: *Wisconsin, *Riparian rights, *Public rights, *Water pollution, Judicial decisions, Legal aspects, Legislation, Water law, Regulation, Boating, Swimming, Lakes, Water supply, Easements, Reasonable use, Cities, Recreation, Public utilities, Local governments, Natural streams, Relative rights, Remedies, Water pollution control.
Identifiers: *Riparian owners.

The defendant city acquired from plaintiff riparian owner an easement to take water from Lake Lavina. The city then passed an ordinance prohibiting contamination of the lake by bathing, boating, and swimming. The plaintiff sought to have the ordinance declared invalid as a taking of property without compensation. The trial court found for the city. The Wisconsin Supreme Court in Bino v City of Hurley, 273 Wis 10, 76 NW2d 571 (1956), reversed on the grounds that riparian owners have a right to the reasonable use of the water of the lake. This right is a property right which carries with it the privilege to use the lake for bathing, swimming, and boating purposes, and, if a city is to deprive a person of such a right, that person must be compensated. The criticism is made that the court, influenced by the equities of the case, announced too sweepingly that the riparian right here involved was a property right. The author suggests that the decision will have little precedential value in a similar situation involving a state statute because of the greater police power possessed by the state and because of the fact that, in reality, public rights as well as riparian rights were involved in Hurley. The argument is made that in Hurley the plaintiff's use was not reasonable in the sense that it resulted in contamination of a public water supply. (Keith-Florida)

RHODE ISLAND WATER RESOURCES BOARD.

R I Gen Laws Ann secs 46-15-1 thru 46-15-10, 46-15-13, 46-15-18, 46-15-19 (Supp 1968).

Descriptors: *Rhode Island, *Administrative agencies, *Water resources development, *Water policy, Water resources, Legislation, Legal aspects, Droughts, Water supply, Water permits, Permits, Water requirements, Water shortage, Water utilization, Water works, Water yield improvement, Administration, Cities, State governments, Leadership, Local governments, Planning, Multiple-purpose projects, Taxes, Regulation, Coordination.

The greatly accelerated demands for more water and a continuing drought have created such serious problems of water resource development, utilization, and control that coordinated governmental and private action is necessary. For this purpose the Water Resources Board is created and its powers and duties set forth. The qualification

procedures for appointment and expenses of Board members are provided. The powers of municipal water agencies, special water districts, and private water companies are restricted. These entities must acquire the approval of the Board before performing specified acts related to water supply facilities. The procedure for the approval of project plans and maps is outlined. No governmental agency or district nor any private company may supply water to other states or water supply systems without Board approval. The Board is granted the power to: (1) enter upon lands and waters for purposes of survey; (2) examine the books, records, and accounts of municipal water departments, special water districts, and private water companies; and (3) require the above bodies to file reports with the Board. The Board's relation to governmental agencies is defined, and Board properties and facilities are exempted from taxation. (Marsee-Florida)

In recent years the combination of new technology resulting in accelerated water demand, population growth, and a continuing drought has threatened the supply of water for domestic, industrial, and recreational use. State government, State and municipal departments, special districts, and private firms must coordinate their efforts toward the control, utilization, and development of the state's water resources. Toward this goal, the Water Resources Board is created. Each member of the Board must be qualified and appointed as provided herein. The members serve without compensation but are reimbursed for their expenses. The officers of the Board and the vote required for action are designated. (Marsee-Florida)

RHODE ISLAND WATER RESOURCES BOARD.
R I Gen Laws Ann secs 46-15-6 thru 46-15-10 (Supp 1968).

Descriptors: *Rhode Island, *Water resources development, *Water supply, *Water policy, Administrative agencies, Water resources, Legislation, Legal aspects, Loans, Water requirements, Water utilization, Water yield improvement, Administration, Cities, State governments, Local governments, Institutions, Multiple-purpose projects, Water permits, Permits, Reservoir operation, Pipelines, Eminent domain, Water works, Water zoning, Long-term planning, Regulation, Supervisory control (Power).

The Water Resources Board shall have the powers and duties to: (1) acquire the properties and facilities necessary for reservoirs and the treatment and distribution of water from the same; (2) exercise the power of eminent domain; (3) construct or purchase water supply facilities where no municipal water agency, special water district, or private water company is willing or able to do so; (4) formulate long-range programs for the development of water sources, transmission systems, and distribution systems; (5) divide the state into areas for providing water supply facilities; (6) regulate the construction and operation of water supply facilities within each area; and (7) make loans to public water supply agencies. No municipal water agency, special water district, or private water company may, without the Board's approval: acquire a water supply, take lands, extend supply or distribution, extend transmission mains, extend water district boundaries, or supply water to municipalities already supplied by another agency. The procedure for obtaining such approval is outlined. No governmental agency or district nor any private company may supply water to other states or to other water supply systems without Board approval. (Marsee-Florida)

THE ECONOMICS OF ARIZONA'S WATER PROBLEM,
Arizona Univ., Tucson. Dept. of Aricultural Economics.
Robert A. Young, and William E. Martin.
Arizona Review, Vol 17, No 3, p 9-18, 1967. 10 p, 6 tab, 14 ref.

Descriptors: *Arizona, *Agriculture, *Economics, *Cost-Benefit ratio, *Overdraft, Arid lands, Groundwater, Consumptive use, Irrigation, Water allocation (Policy), Water policy.
Identifiers: *Growth (Economic), *Central Arizona Project.

The authors hold that in Arizona, where per capita water consumption ranks among the highest in the nation, the price system should be proportionate to allocation of the water. At present the annual water deficit which is met by overdraft of groundwater, is 3.5 million acre feet, an amount equal to that consumed by low value extensive crops. These crops rank lowest among economic activities of the state in terms of dollars of personal income returned per acre foot of water used. Arizona's water problem is not one of physical shortage but of allocation of available water those economic sectors that will maintain a high rate of economic growth. Their estimates based on present plans for allocating Colorado River water diverted through the proposed Central Arizona Project cast doubt as to whether the Project can generate economic benefits in excess of costs of construction and operation. The fact that sufficient resources are available to finance the Project is no measure of its economic desirability. (Crouse-Arizona)

PATTERNS OF WATER USE IN THE ARIZONA ECONOMY,
Arizona Univ., Tucson. Dept. of Agricultural Economics.
William E. Martin, and Leonard G. Bower.
Arizona Review, Vol 16, No 12, Dec 1966, p 1-6. 6 p, 3 tab.

Descriptors: *Arizona, *Economics, *Overdraft, *Groundwater, *Agriculture, Decision making, Economic justification, Irrigation water, Consumptive use, Water demand, Industrial water, Municipal water, Input-output analysis, Water allocation (Policy).
Identifiers: *Central Arizona Project.

Although water is scarce in Arizona its per capita use is over three times the national average. Past needs were met by diverting surface flow or tapping underground supplies. Solution of today's problem involves development of supplies outside the state or reallocation of existing supplies within the state, or both. In 1958 agricultural industries used over 90% of the water supplied for economic production. Relative use has probably remained similar. Food and feed grains consume about 50 acre-feet of water per $1,000 output, compared with .032 acre-feet for the same value output in the mining industry. All uses total approximately seven million acre-feet per year compared with average annual income of 3.6 million acre-feet. Even with the addition of 1.2 million acre-feet from the Central Arizona Project there will be a large deficit and some reallocation will eventually be necessary even without growth. From the data presented it is evident that crucial reallocation decisions will likely fall upon crop agriculture if continued overdraft of groundwater is to be checked. (Crouse-Arizona)

CONDEMNATION BY CITIES, COUNTIES, AND DISTRICTS FOR FLOOD CONTROL OR DRAINAGE.

Ky Rev Stat Ann secs 104.170-104.180 (1963).

Descriptors: *Kentucky, *Flood control, *Cities, *Condemnation, Legislation, Drainage, Levees, Soil conservation, Judicial decisions, Administrative agencies, Overflow, Local governments, Drainage districts, Flood protection, Channel improvement.

When any land, right of way, or easement over or through any property is needed by a city, county,

flood control, drainage, levee, reclamation or soil conservation district to perform work for flood control, flood protection or drainage purposes, the governing body may order the condemnation of the land or right of way. The judge of the circuit court shall grant and award immediate possession and full and complete use and control of said land or right of way to the city, county, flood control, drainage, levee, reclamation, or soil conservation district by an interlocutory judgment which shall be ordered immediately after the filing of the report by the commissioners appointed by the court. The commissioners may report at any time after summons has been fully issued or a warning order attorney appointed. The court may require a bond to be executed. The condemnation may not be abandoned after possession has been obtained unless none of the defendant parties will be materially prejudiced thereby. Cities of the fourth class may acquire land by purchase or condemnation for the purpose of straightening or widening any creek running through the corporate limits of the city to prevent or lessen the overflow thereof. Any floatable thing of value that becomes derelict in any watercourse of the state or in the beds thereof and which has been relinquished, deserted, or abandoned shall become the property of the owner of the bed of the stream. Such owner may raise, float, or salve said property. Any person claiming to be the owner of such property may institute an action in replevin for the recovery of such property. The defendant in such suit shall have a lien against the salvaged property for the expense of raising it. Any person who desires to claim compensation for salvage services rendered shall file a petition in the circuit court. If any person shall convert to his own use any floatable thing of value not belonging to him, he shall be guilty of a misdemeanor punishable by a fine of not less than double the value of the property converted or imprisonment not exceeding six months. (Schram-Florida)

HIGHWAYS, FERRIES, WATERWAYS.

Miss Code Ann secs 2203, 2205, 2206, 2210, 2211 (1956).

Descriptors: *Mississippi, *Bridges, *Bridge failure, *Navigable waters, Streams, Canals, Channels, Navigation, Transportation, Bays, Harbors, Water law, Legislation, Legal aspects, Lumbering.
Identifiers: *Obstructions to navigation.

If any keeper or owner of a public ferry, toll-bridge, or causeway shall fail to give bond as required by law, suffer said structure to be out of good repair for more than five days, or cause any person to be unreasonably detained by carelessness, wilfulness, or negligence, such owner or keeper, upon conviction, shall be fined not more than fifty dollars. Any person who wilfully obstructs, breaks, or destroys any bridge, causeway, or ferry, which was established for the convenience of the public by the proper authority, shall be fined not more than one hundred dollars. Any person who obstructs in any way a stream or canal not less than one hundred and fifty feet wide without immediately removing the obstruction shall be guilty of a misdemeanor and shall be fined not more than fifty dollars or be imprisoned not more than one week. If any person shall obstruct any navigable bay, river, creek, or other navigable channel or shall discharge any ballast in a place other than that designated by the harbor commissioners, the offender shall be fined not more than one thousand dollars or imprisoned not longer than six months. (Schram-Florida)

NAVIGABLE WATERS - PUBLIC HIGHWAYS.

Miss Code Ann secs 8413 thru 8418 (1956).

Descriptors: *Mississippi, *Navigable waters, *Navigation, Legislation, Navigable rivers, Lumbering, Bridges, Remedies, Obstruction to flow, State governments, Administration, Water law, Water policy, Water zoning, Water courses, Public rights.

All watercourses that have been or may be declared navigable, by act of the legislature or by the Board of Supervisors of the county in which the same may be, shall be public highways. All rivers, creeks, and bayous of twenty-five miles in length that have sufficient depth and width for thirty consecutive days in the year for floating a steamboat are declared to be navigable waters. Any person may enter and remove any and all obstructions across, in, or over any navigable stream. If any person obstructs a navigable stream by allowing logs to accumulate thereon, any other person may cause the jam to be broken. The cost for breaking the jam shall be borne by the owner of the accumulated logs. A lien on these logs shall exist for the payment of these costs. If any person floating timber or logs shall permit damage by such logs to be done to a bridge at public expense, he shall be liable therefor. Damages may be recovered by suit against him and the logs causing the damage may be seized and sold therefor. (Schram-Florida)

BRIDGES - BOUNDARY AND OTHER WATERS.
Miss Code Ann secs 8435 - 8447 (1956).

Descriptors: *Mississippi, *Bridge construction, *Boundaries (Property), *Bridges, Construction costs, Engineering structures, Administrative agencies, State governments, Federal government, Condemnation, Costs, Easements, Legal aspects, Eminent domain, Land tenure, Legislation, Damages, Financing, Local governments, Cities.

Any municipality or county or the State Highway Commission may construct and maintain toll or free bridges and approaches thereto. The bridges may extend over any bodies of water forming boundaries of the state. Funding of bridge construction may be accomplished by bonds. Municipalities may operate under this title by ordinance or resolution without necessity of charter amendment. Where a contemplated bridge construction will be connected to the public highway system, the State Highway Commission may contribute to the cost of construction or maintenance. Public agencies may purchase or acquire by condemnation such lands or servitudes needed for bridge construction. Public agencies of adjoining states may operate under this act in construction and maintenance of bridges across Mississippi boundaries. Any municipality or other public body may secure federal funds or other assistance through government contracts. These contracts may be entered into by ordinance or resolution. (Kelly-Florida)

SEA FOODS.
Miss Code Ann secs 6047-01 thru 6047-04, 6047-06, 6047-10 thru 6047-13, 6047-17, 6047-18, and 6051.5 (Supp 1968).

Descriptors: *Mississippi, *Fish conservation, *Marine fish, *Gulf of Mexico, Saline water fish, Commercial fishing, Commercial shellfish, Legislation, Saline water, Freshwater interfaces, Administrative agencies, Decision making, Leases, Rent, Permits, Oysters, Clams, Shrimp, Shellfish, Taxes, Tax rate, Canneries.

The public policy of Mississippi as to sea food laws is expressed. All of the wild aquatic life found in the waters of the State, until legally taken, is the property of the State. The Marine Conservation Commission is established to manage, control, supervise, and direct any matters pertaining to salt-water aquatic life. The organization of the commission, its members, and their compensation are outlined. The jurisdiction, authority, and duties of the commission are expressly provided. Generally, this empowers them to regulate all types of sea food except menhaden, trash fish, tuna, and red snapper. The rights of riparian owners on the Gulf Coast are defined. The commission is granted authority to lease the bottoms within its jurisdiction upon certain terms and conditions. The justices of the peace of the various counties are given jurisdiction over any prosecution or suit brought under this act. General penalties for violation of the provisions of this act are detailed. The commission is authorized and directed to assess and collect various licenses and taxes. The commission is also authorized to enter into an agreement for jurisdictional purposes as to the dividing line between salt and fresh waters. (Schram-Florida)
W70-00967

SEA FOODS.
Miss Code Ann secs 6047-01 thru 6047-04, 6047-06 (Supp 1968).

Descriptors: *Mississippi, *Fish, *Oysters, *Clams, Marine fish, Shellfish, Shrimp, Legislation, Fish conservation, Wildlife conservation, Saline water fish, Aquatic life, Reefs, Oceans, Gulf of Mexico, Marine fisheries, Commercial shellfish, Commercial fishing, Administrative agencies, Decision making.
Identifiers: *Sea foods, Propagation of marine life, Tonging reefs.

The public policy of the State is to recognize the need for a concerted effort to work toward the protection, propagation, and conservation of its sea food and aquatic life. All wild aquatic life existing in the waters of the State, including shell fish, are the property of the State until legally divested in the manner described herein. The Marine Conservation Commission is created and has the full power to manage, control, supervise, and direct any matters pertaining to saltwater aquatic life. The Commission shall be made up of ten members appointed by the governor with the qualifications herein. The Commission has authority over the taking, catching, and processing of shrimp, oysters, and crabs, but not over trash fish, menhaden, tuna, and red snapper. The Commission shall: (1) set standards of measure; (2) regulate fishing seasons; (3) set size, catching, and culling regulations; (4) set forth enforcement procedures and penalties for violation; (5) enter into advantageous interstate and intrastate agreements; (6) enact all ordinances necessary for the protection, conservation, or propagation of shrimp, oysters, and crabs; and (7) aid in the construction of canals to bring water to existing oyster reefs or beds. (Schram-Florida)
W70-00968

SEA FOODS.

Miss Code Ann secs 6047-10 thru 6047-13, 6047-17, 6047-18, 6051.5 (Supp 1968).

Descriptors: *Mississippi, *Riparian rights, *Oysters, *Saline water fish, Taxes, Tax rate, Assessments, Commercial fishing, Shellfish, Saline water, Freshwater interfaces, Gulf of Mexico, Leases, Rent, Permits, Shrimp, Canneries, Legislation, Fish conservation, Commercial shellfish.

The sole right of planting and gathering oysters in front of land bordering the Gulf of Mexico or Mississippi Sound belongs to the riparian owner and extends not more than 750 yards from the shore. The commission is granted authority to lease the bottoms within its jurisdiction upon certain conditions. These include: (1) lessees shall be residents of Mississippi; (2) leases must be for from five to one hundred acres; (3) applications for leases shall be considered in the order which they are filed; (4) rental shall be from one to five dollars per acre; and (5) all leases shall be subject to the paramount right of the state. The justices of the peace of the various counties shall have original jurisdiction over all prosecutions and suits brought under this act. A series of penalties for violations of this act are provided. The commission is authorized and directed to assess and collect taxes and licenses from (1) vessels catching, carrying, or transporting fish or oysters; (2) factories canning fish or oysters; (3) inspection fees; and (4) buyers or handlers of sea food. A provision for an agreement for jurisdictional purposes as to the dividing line between salt and fresh waters is provided. (Schram-Florida)

SEA FOODS: OYSTERS.
Miss Code Ann secs 6072, 6075-12, 6077, 6085-01, 6085-11 (Supp 1968).

Descriptors: *Mississippi, *Oysters, *Commercial shellfish, *Regulation, Fish harvest, Dredging, Inspection, Shellfish, Legislation, Administrative agencies, Local governments, Fish stocking, Fishing, Gulf of Mexico.

By order of the Seafood Commission, the Chief Inspector shall cultivate and improve the oyster beds under the control of the state of Mississippi. He may relocate oysters, spend funds for propagation, and advise the Commission of suitable sites for new beds. The Commission may prohibit taking oysters from areas where the water is impure or liable to be harmful to oysters. In certain areas dredging for oysters is prohibited, and no one may take oysters by any means after dark. Any municipality bounding on the Gulf of Mexico, which has an oyster bed within its corporate limits, may aid in enforcing the oyster laws of this state. (Darragh-Florida)

BRYANT V PEPPE (ESTOPPEL TO ASSERT TITLE WHEN LAND CHANGED BY AVULSION).
226 So2d 357-358 (2d DCA Fla 1969).

Descriptors: *Florida, *Avulsion, Judicial decisions, Boundaries (Property), Shores, Assessments, Taxes, Accretion (Legal aspects).

Appellee's land was formerly separated from the Gulf of Mexico by land on the west which was obliterated by avulsion. The owners were denied a decree quieting title to the land now fronting on the Gulf because title was held to be in the state. The court has declared that avulsion precludes attainment of title by the private owners of adjoining property by accretion, but in this case the state was estopped from claiming title. The predecessor in title had successfully defended his possessory right to the Gulf frontage in an action upheld by the Supreme Court. The tax assessor assessed the property as fronting on the Gulf for many years, and the state did not offer to do equity for the overcharge if the state was found to be the owner. The state's treatment of public property as property of private citizens may result in the loss of it. (Douberley-Florida)

INSPECTION DISTRICTS; POLICE FLEET.
Va Code Ann secs 28.1-37 thru 28.1-46 (1969).

Descriptors: *Virginia, *Fishing, *Administrative agencies, *Commercial fishing, Commercial shellfish, Regulation, Administration, State jurisdiction, Legal aspects, Legislation, Permits, Boats, Inspection, Control, Surveys, Taxes.

The Commission of Marine Resources shall create inspection districts within its jurisdiction. The number of districts should be the smallest possible commensurate with the efficient enforcement of fish and shellfish laws. The Commission shall appoint chief inspectors and inspectors for each district. The Commission shall also designate officials in each district to collect fees for services and issuance of licenses. Inspectors are responsible for collection reports. The police fleet consists of the boats now operated by the Commission and may be enlarged in accordance with special law or general powers conferred by law. (Kelly-Florida)
W70-00974

FISH AND FISHING GENERALLY: FISH FOR MANUFACTURE INTO FISH MEAL, OIL.
Va Code Ann secs 28.1-58 thru 28.1-66 (1969).

Descriptors: *Virginia, *Commercial fishing, *Permits, Administrative agencies, Administration, Taxes, Commercial fish, Regulation, Reasonable use, Fish management, Fish conservation, Inspections, State jurisdiction, State governments, Tidal waters, Legislation, Legal aspects, Fish.
Identifiers: Penalties (Criminal), Purse nets, Fish meal, Fish oil.

Food fish may not be taken for use in manufacture of fish meal or oil. One percent of a catch used for this purpose may consist of food fish, but only if all living food fish found in the net are immediately released. Violation of this provision is a misdemeanor. Those persons or corporations desiring to fish with purse nets for fish to be used in manufacture of fish meal, scraps, or oil must procure a license. The amount of the license tax depends upon the type and size of the operation. Except for taking 'menhaden' fish, no non-resident will be licensed to catch fish for meal or oil manufacture in the waters of the state. The Commissioner of Marine Resources shall make final approval of license applications, subject to judicial appeal to the appropriate circuit court. Violation of this title will result in prosecution for a misdemeanor and forfeiture of any vessel and/or tackle used in the violation. Non-residents may be stockholders or employees of domestic corporations engaged in the fishing herein described. (Kelly-Florida)
W70-00975

FISH AND FISHING GENERALLY: TROLLS, TRAWL NETS, AND DRAG NETS.

Va Code Ann secs 28.1-67 thru 28.1-72.1 (1969).

Descriptors: *Virginia, *Commercial fishing, *Commercial fish, *Nets, Regulation, Trawling,

Productivity, Tidewaters, State jurisdiction, State governments, Fishing, Legislation, Legal aspects, Permits, Ships, Boats, Administration, Administrative agencies.
Identifiers: Trawl nets, Drag nets.

Use of a troll or trawl net, drag net or similar device drawn through the water by a vessel for the purpose of taking fish is prohibited. Purchase or sale of fish taken in this manner is also prohibited. The Commissioner of Fisheries may issue licenses for trawl fishing in specific areas during certain months. Otherwise, the finding of any vessel equipped for trawling or trolling is prima facie evidence of a violation of the statute. Any vessels used in the violation of the statute, together with tackle and cargo shall be forfeited to the state. Nothing in the statute prohibits the lawful transportation of fish caught outside the state jurisdiction into Virginia ports to be marketed. (Kelly-Florida)
W70-00976

FISH AND FISHING GENERALLY: MARKING OF BOATS, NETS, AND OTHER DEVICES.

Va Code Ann secs 28.1-73 thru 28.1-81 (1969).

Descriptors: *Virginia, *Commercial fishing, *Permits, *Administrative agencies, Commercial fish, Boats, Ships, Fish management, Fish conservation, Fish, Tidal waters, Nets, Inspections, Control, Regulation, State jurisdiction, State governments, Taxes.

The Commissioner of Marine Resources is obligated to provide license tags where required by statute or regulation. The inspectors furnish these tags to licensees upon payment of license taxes, and the tags must be prominently displayed. Tags for certain fishing devices are required. Any person employing a fishing device which requires the use of poles or stakes must remove all abandoned stakes, save one which can be left as an identification marker. The Commission may revoke the fishing licenses of those who fail to comply. Fishing in certain waters is prohibited. (Kelly-Florida)
W70-00977

TAKING OYSTERS GENERALLY.
Va Code Ann 28.1-82 thru 28.1-85 (1969).

Descriptors: *Virginia, *Oysters, *Commercial shellfish, *Shellfish, Reasonable use, State jurisdiction, Tidal waters, Fish conservation, Permits, Legislation, Legal aspects, Clams, Commercial fish, Commercial fishing, Regulation, Administrative agencies, State governments, Administration, Fishing, Control.
Identifiers: Oyster seasons, Oyster tongs, Natural oyster beds, Oyster seed beds.

Seasons are established for the taking of oysters from natural or public oyster beds, rocks, or shoals in the waters of the state. The length of the season varies with the location and with the fishing method used. The finding of any person possessing patent tongs or shaft tongs upon the public or natural oyster beds or shoals, at times other than those specified, is prima facie evidence of violation of this statute. No one may use patent tongs for catching oysters from natural beds in certain specified areas. The Commission may close or open any area, or restrict the manner of taking oysters in public or natural rocks, grounds or shoals, in order to protect and promote the growth of oysters. The Commission may establish seed beds and plant shells or take any other restorative measures it deems necessary. Closing of areas may be for any period, provided that notice is given. Reopening of oystering grounds need not be accompanied by notice. (Kelly-Florida)
W70-00978

OYSTER RECORDS AND TAXES.

Va Code Ann secs 28.1-87 thru 28.1-95 (1969).

Descriptors: *Virginia, *Oysters, *Taxes, *Commercial shellfish, Shellfish, State jurisdiction, Fish conservation, Permits, Legislation, Legal aspects, Commercial fishing, Regulation, Administrative agencies, Administration, Assessments, Costs, Tax rate, Tariff, Government finance, Financing, Inspection.
Identifiers: *Oyster replenishment, Oyster dealers, Oyster buyers, Oyster planting, Seed oysters.

Designated commercial oyster dealers are required to keep daily records of oysters packed or marketed by them. They must pay a specified tax on each bushel of oysters taken; the tax is to be collected by the district inspector or a police boat captain. The Commissioner or any inspector may examine any oysters taken or purchased as to quality or quantity. Persons purchasing oysters from those catching or taking oysters from public rocks, beds, or shoals must have an oyster buyer's license issued by the Commission of Marine Resources. Oyster buyers must also submit records of purchases to the Commission. All oyster replenishment taxes, collected on each purchase of oysters, are deposited in the Public Oyster Rocks Replenishment Fund, to be used for replenishment, planting, and replanting the public oyster rocks, beds, and shoals within the state jurisdiction with seed oysters, oyster shells, or other material to catch, support, and grow oysters. The Commissioner may contract with private persons or firms in carrying out the replenishment. (Kelly-Florida)
W70-00979

CARRYING OYSTERS FROM STATE OR CERTAIN GROUNDS.

Va Code Ann secs 28.1-96 thru 28.1-99 (1969).

Descriptors: *Virginia, *Oysters, *Permits, *Commercial shellfish, State jurisdiction, Fish conservation, Legislation, Legal aspects, Regulation, Reasonable use, Administration, Administrative agencies, Commercial fishing, Shellfish, Conservation, Fish management, Taxes.
Identifiers: Oyster seed areas.

Permits issued by the Commission of Marine Resources must be obtained before anyone may transport oysters out of the state. A tax on each bushel must be paid before a permit will be issued. The Commission is obligated to issue these permits unless, after examination of the seed areas, it is ascertained that removal would either deplete or injure the seed areas or render the remaining supply insufficient to meet residents' demands. State residents must obtain a permit before removing oysters from certain areas as well as before planting them within the state. (Kelly-Florida)
W70-00980

LICENSING OF STATIONARY AND FLOATING DUCK BLINDS.

Va Code Ann secs 29-83 thru 29-87, 29-90 (1969).

Descriptors: *Virginia, *Permits, *Riparian rights, *Administrative agencies, Hunting, Water-fowl, Migratory birds, Shores, Conservation, Wildlife conservation, Recreation, Legal aspects, Water utilization, Regulation, Control, Public rights.
Identifiers: Duck blinds, Trespass, Penalties (Criminal), Public waters.

Floating duck blinds must be licensed and may be anchored no closer than 500 yards to a stationary blind or other licensed floating blind. Fees for licenses for blinds are based on the type of blind, and licenses are issued between July 1 and October 31 of each year. Riparians have the exclusive privilege of licensing and erecting blinds on their shore and in the public waters in front of such shore, if licenses are obtained between July 1 and August 31. If such blinds are erected and tagged, no other stationary or floating blind may be located within 500 yards without the consent of the riparian or his lessee or permittee. The riparian's failure to exercise this privilege within the stated period allows other persons to erect and license blinds in the offshore waters. Hunting from a boat, float, or raft other than a licensed blind within 500 yards of a licensed blind constitutes a trespass to the licensed blind. Violation of licensing and hunting provisions are a misdemeanor. (McDonough-Florida)
W70-00981

FISHING PERMITS; NATIONAL FORESTS.

Va Code Ann secs 29-108, 29-110, 29-114.1, 29-117 thru 29-120 (1969).

Descriptors: *Virginia, *Permits, *Fish management, *Fish conservation, Legislation, Legal aspects, Regulation, Fish, Rainbow trout, Brook trout, Fish reproduction, National forests, Natural resources, Administrative agencies, Federal government, Nets, Fyke nets, Gill nets, Financing, Sport fish, Wildlife management, Wildlife conservation, Fish farming, Fish hatcheries, Reproduction.
Identifiers: Licenses, Fish propagation.

The fee for a permit to breed and artificially raise rainbow trout and brook trout for sale from a privately owned hatchery is five dollars. The fees for permits to net certain species of fish by specified methods are established. The Commission is authorized to issue permits to private fish pond owners to sell game fish therefrom for propagation only. No person may fish in the national forests within the state without first obtaining, in addition to the regular resident or non resident license, a special permit at the cost of one dollar. Revenue from the sale of special permits will be used by the Commission for wildlife management purposes in the national forests within the state, or in the discretion of the Commission such revenue may be paid into the United States treasury for use of the United States Forest Service for wildlife management purposes in the national forests within the state. The Commission will enter into a cooperative agreement with the United States Forest Service to define ways to improve the wildlife resources of the national forests within the state and to program the expenditure of funds derived from special permit sales. (Keith-Florida)
W70-00982

THE TAKING OF MINERALS FROM BEDS AND NAVIGATION.

Va Code Ann secs 62.1-4 thru 62.1-9 (1968).

Descriptors: *Virginia, *Minerology, *Navigation, *Obstruction to flow, Legislation, Legal aspects, Administrative agencies, Regulation, Easements, Leases, Beds, Royalties, Fishing, Oysters, Shellfish, Dredging, Drilling, Wildlife conservation, Watercourses (Legal), Dams, Barriers, Mining, Dam construction, Relative rights, Ownership of beds.
Identifiers: *Marine resources, *Shells.

The Marine Resources Commission may grant easements in and leases to the beds of state waters. The terms of such easements and leases will specify the rent royalties and other proper terms. Such easements and leases may authorize the grantees and lessees to take oil, gas, and such other minerals as are therein specified, provided no such talking will interfere with the public rights of fishing, fowling, and oystering. The Commission of Game and Inland Fisheries is empowered to regulate drilling, dredging, or other operations designed to obtain shells or minerals in specified beds in order to prevent harm to wildlife. The circuit court of any county may contract to have obstructions removed from any watercourse within its jurisdiction. Any previous act granting the power to abate or remove dams or other works or to improve navigation is declared valid. The water use rights of the state or any company incorporated for navigation improvement will not be affected by any court order granting any person permission to obstruct any watercourse. Courts will not in the future issue any order which will result in an obstruction to navigation. (Keith-Florida)

W70-00983

STATE POLICY AS TO WATERS.

Va Code Ann secs 62.1-11 thru 62.1-13 (1968).

Descriptors: *Virginia, *Water resources, *Water conservation, *Public benefits, Legislation, Legal aspects, Regulation, Natural resources, Streams, Lakes, State jurisdiction, Water resources development, Watercourses (Legal), Contracts, Cities, Reasonable use, Public rights, Local governments, Water utilization, Usufructuary right.
Identifiers: *Policy.

The waters of the state are a natural resource which should be regulated by the state. The regulation, control, development, and use of waters for all purposes beneficial to the public are within the jurisdiction of the state which may establish measures to effectuate the proper utilization and protection of such waters. The needs of the people may require state water resources to be put to public uses. The waste or unreasonable use of water should be prevented, and the conservation of water is to be exercised with a view to the public welfare. The public welfare requires the proper development, wise use, conservation, and protection of water resources. The right to the use of water or to the flow of water in or from any natural stream, lake, or other watercourse is limited to such water as may be required for the public use. Nothing in this act will operate to affect any valid use of the waters of the state, nor will it be construed as applying to the determination of rights in any proceeding. The purpose of this act is to recognize the public use to which water is devoted, and the act will not divest any governmental unit of any rights or responsibilities. (Keith-Florida)
W70-00984

TAKING OF SEAWEED BY INHABITANTS OF BARRINGTON.

RI Gen Laws Ann secs 46-11-1 thru 46-11-3 (1956).

Descriptors: *Rhode Island, *Aquatic weeds, *Beaches, *Riparian plants, Consumptive use, Weeds, Seashores, Shores, Oceans, Relative rights, Vegetation, Crop production, Plants.
Identifiers: *Seaweed, Penalties (Criminal).

The inhabitants of the town of Barrington may, between sunrise and sunset, take seaweed from the public beach at Barrington. Each person shall be limited to two cart or wagon loads in one day. However, no person shall take more than one load until all others taking seaweed shall have obtained one load each. This privilege is restricted to Barrington inhabitants. Persons violating this act shall forfeit ten dollars for each load of seaweed carried off. (Marsee-Florida)
W70-00985

FISHING IN INTERSTATE NONTIDAL WATERS.

Va Code Ann secs 29-153.1, 29-153.2 (1969).

Descriptors: *Virginia, *Sport fishing, *Interstate compacts, *Permits, Legislation, Legal aspects, Fish, Fishing, Regulation, Administrative agencies, Wildlife management, Fish conservation, Water law, Interstate, Control, Water utilization.
Identifiers: *Nontidal waters, *Interstate waters, *Reciprocal agreements, Penalties (Criminal).

It is lawful for citizens of Virginia and citizens of adjoining states which have nontidal water partly in such adjoining state and partly in Virginia to fish in such interstate nontidal waters; each citizen must comply with his own state's laws for taking fish in such waters. The Commission of Game and Inland Fisheries is empowered to enter into a reciprocal agreement with any state sharing interstate nontidal waters with Virginia relating to the following: (1) recognition of a resident sport fishing license acquired in an adjoining state when the licensee is fishing in such waters; and (2) strict observance of state creel limits, open seasons, and all other laws and regulations of the adjoining state. The failure of any person to comply with the rules established under such agreement will subject such person to criminal penalties. (Keith-Florida)
W70-01020

CLUBS, PRESERVES, AND NATIONAL FORESTS; COMPLIMENTARY LICENSES.

Va Code Ann secs 29-78 thru 29-80 (1969).

Descriptors: *Virginia, *Wildlife management, *Permits, *Wildlife conservation, Hunting, Fishing, Trapping, Administrative agencies, Conservation, Fish conservation, Forests, National forests, Public lands, Recreation.

All persons including those on the lands or waters of any public or private club must obtain a license before hunting, trapping, or fishing this state. A regular license, as well as a special permit, are required before any person may hunt, fish, or trap on any lands in the national forests in this state. The Commission of Game and Inland Fisheries may issue a limited number of complimentary hunting and fishing licenses to United States conservation officials. (McDonough-Florida)

APPROPRIATION WATER LAW ELEMENTS IN RIPARIAN DOCTRINE STATES,
J. H. Beuscher.
Buffalo L Rev, Vol 10, No 2, p 448-458, Winter 1961. 11 p, 48 ref.

Descriptors: *Appropriation, *Water rights, *Riparian rights, *Water policy, Prior appropriation, Preferences (Water rights), Priorities, Natural flow doctrine, Competing uses, Regulation, Relative rights, Water allocation (Policy), Water utilization, Consumptive use, Waste dilution, Water demand, Public utilities, Water distribution (Applied), Water management (Applied), Domestic water, Reasonable use, Artificial use, Industrial water, Irrigation water, Mill dams, Riparian land, Riparian waters, Usufructuary right, Waste disposal, Zoning, Local governments.

It is an overgeneralization to say that humid states apply the riparian doctrine. Legislation, administration and adjudication in many instances deal more with appropriation principles rather than with riparianism. This is seen in three areas: the precedence given to the reasonable use doctrine over the natural flow precept in many decisions; the preferred protection given to a prior user as against a subsequent water claimant; and the willingness of courts to allow water to be taken for non-riparian lands. Courts have qualified correlative co-sharing by granting prescriptive rights to an open, notorious, adverse user. The right to domestic use has been extended to include water taken by municipal utilities, a right that is often held to be superior to that of co-riparians. The riparian who is first to construct a mill dam has been granted appropriative status, often to the complete destruction of natural flow. Downstream riparians are treated as inferior to upstream riparian polluters, and many states give preferences to industrial users. Local governments can restrict the use of water by riparians by zoning the riparian land, thus disrupting co-sharing equality among riparians. A description of riparian water laws is a difficult task. (Douberley-Florida)

ACQUISITION OF THE RIGHT TO USE WATER,
Ewell P. Walther, Jr.
Tul L Rev, Vol 29, No 3, p 554-565, Apr 1955. 12 p, 123 ref.

Descriptors: *Water rights, *Water users, *Riparian rights, *Prior appropriation, Natural flow doctrine, Judicial decisions, Reasonable use, Legislation, Louisiana, Legal aspects, Water law, Water pollution, Subsurface waters, Relative rights, Water utilization, Usufructuary right.
Identifiers: Common law, Acquisition.

Water rights may be acquired in several ways. Generally, states east of the Mississippi employ the common law riparian rights doctrine, and western states adhere to the doctrine of prior appropriation either in conjunction with or exclusive of the doctrine of riparian rights. Water rights may also be acquired by contract and by prescription. Under the common law of riparian rights two theories have developed - the natural flow theory and the reasonable use doctrine. Both theories are defined herein. Under the prior appropriation doctrine, which the author favors, the first appropriator in time gains a superior right. All public waters are subject to appropriation. Many variations have been developed by legislation. Complex problems have arisen in western states utilizing both the riparian rights and prior appropriation doctrines. In these states, a riparian proprietor may choose either but not both of these theories. Both riparian and appropriative water rights may be acquired by prescription. Water rights in Louisiana are somewhat unsettled, but judicial decisions seem to look to the common law. (Heckerling-Florida)

FISH (LICENSES AND PERMITS).

Ill Ann Stat ch 56, secs 225-242 (Smith-Hurd 1967), as amended, (Supp 1969).

Descriptors: *Illinois, *Regulation, *Fish, *Permits, Legislation, Commercial fishing, Sport fishing, Fishing gear, Mussels, State jurisdiction, State governments, Administrative agencies, Control, Legal aspects, Interstate compacts.

Fishing licenses are issued only upon application. Penalties are provided for violation of this provision. Fees for resident and non-resident licenses are set. The Department of Conservation may enter into reciprocal fishing agreements with Missouri, Iowa, and Indiana to permit persons licensed by these states to fish in any of the running waters forming a boundary between such states and Illinois. Resident retail fish dealers and wholesale dealers must procure a license. All licenses issued to retail fish dealers are valid only in the location described on the license application. To catch mussels and to engage in fish taxidermy also requires a license, as does the breeding of fish. Any person who desires to establish a fee fishing pond must apply for a license. The holder of the license must require all fishermen in such pond to register daily. Permits for the collection of fish for scientific purposes are granted. (Moulder-Florida)

CONSTRUCTION, OPERATION, AND MAINTENANCE OF TOLL BRIDGES OVER PEARL RIVER.
Miss Code Ann secs 8447-51 thru 8447-68 (Supp 1968).

Descriptors: *Mississippi, *Bridges, *Local governments, *Bridge construction, Financing, State governments, Legislation, Legal aspects, Right-of-way, Easements, Condemnation, Eminent domain, Riparian lands, Beds under water, Federal government, Construction costs, Bridge design.

The legislature has declared that construction of additional bridges across the flood plain of the Pearl River will promote the economic development of the state, and the general welfare of the people. Any county bordering on the Pearl River is authorized to construct and maintain toll bridges across the river and/or its flood plain. The county may issue bridge revenue bonds to defer costs, may act jointly with other counties, and may enter agreements with federal or other governing agencies to further construction or financing. The county engaged in construction of a bridge under this act may purchase such lands, rights-of-way, easements in lands under water, and riparian lands or may acquire such lands and servitudes by eminent domain. NEW JERSEY TURNPIKE AUTHORITY V SISSELMAN (CONDEMNATION OF RIPARIAN LAND).
106 NJ Super 358, 255 A2d 810-817 (1969).

Descriptors: *New Jersey, *Condemnation, *Bridge construction, *Riparian land, Judicial decisions, Legislation, Federal government, Rivers and Harbors Act, Canals, Highways, State governments, Administrative agencies, Projects.

Plaintiffs brought suit to have certain property owned by defendant condemned in the public interest so that a highway spur might be built from the existing turnpike. The project was expressly authorized by the legislature. Defendant contended that the taking violated the Federal Harbors and Rivers Act and that the Authority had failed to comply with the requirements of a state statute. The land in question was needed for the construction of two bridges over a canal. Under the federal act any construction must be approved by the Corps of Engineers. The Turnpike Authority had applied for approval but had not received it when construction on the bridges began. Under the state statute, any public project must be referred to a planning board for review which the Authority failed to do. After reviewing the statutes the court upheld the denial of an injunction against the condemnation by the Authority. The court held that the Authority had complied with both statutes. Under the federal act, since no construction had begun on an unapproved bridge, the statute had not been violated. The court also held that the state statute did not apply once the legislature had authorized the project. (Heckerling-Florida)

Va Code Ann secs 29-51 thru 29-53, 29-55 thru 29-55.2, 29-55.4, 29-57 thru 29-60, 29-77.1 (1969).

Descriptors: *Virginia, *Permits, *Administrative agencies, *Wildlife management, Legislation, Hunting, Fishing, Trapping, National parks, Fish stocking, Fisheries, Fish conservation, Wildlife conservation, Recreation, Regulation, Legal aspects.
Identifiers: Licenses.

All persons must have permits to hunt, fish, or trap in this state, except that no permit is required for landowners on their own lands, residents under sixteen or over seventy on private lands in the county of residence, or Indians residing on reservations. Permits are available to state residents, landowners with at least four months residence, members of the armed forces in this state, and students in preparatory schools, colleges, or universities in this state. Non-residents must purchase a non-resident license. Special licenses are required to fish in waters stocked by the Commission of Game and Inland Fisheries and in the waters of the Shenandoah National Park and the Blue Ridge Parkway. Holders of trip fishing permits cannot fish in trout streams or waters stocked by the Commission. (McDonough-Florida)

FISH LAWS.

Va Code Ann secs 29-148 thru 29-153 (1969).

Descriptors: *Virginia, *Fish, *Fish management, *Fishing, Legislation, Legal aspects, Regulation, Herrings, Mullets, Bass, Trout, Perches, Streams, Rivers, Fish reproduction, Fish conservation, Dams, Fish ladders, Watercourses (Legal), Fish barriers, Navigation, Water pollution, Damages, Fish stocking, Fish hatcheries, Administrative agencies.
Identifiers: *Inland waters, *Fish wheels, *Game fish, Shad, Penalties (Criminal).

Until otherwise provided by a regulation of the Commission of Game and Inland Fisheries, it shall be unlawful for any person to take any fish in inland waters other than shad, herring, or mullet except by fishing with a hook and line or rod and reel. It is likewise unlawful to possess any species of bass or trout except as specifically provided. It is lawful to sell trout which have been propagated and raised in a hatchery. The open season during which it will be lawful to take bass and trout by specified lawful methods will be as promulgated by Commission regulations. Owners and lessees of private ponds may take fish therefrom for personal use at any time. Any dam or other barrier in a watercourse which obstructs navigation or the passage of fish will be deemed a nuisance unless useful to the public and permitted by law or court order. Owners of obstructions to the free passage of fish will provide such obstructions with fish ladders. Fish wheels may be operated in the ponds of this state for the purpose of restocking such ponds. It is unlawful, with specified exceptions, to use any substance for the destruction of fish or to place any noxious substance in any watercourse. (Keith-Florida)

OWNERSHIP OF BEDS.

Va Code Ann secs 62.1-1 thru 62.1-3 (1968).

Descriptors: *Virginia, *Beds, *Ownership of beds, *Riparian rights, Legislation, Legal aspects, Bays, Rivers, Shores, Jurisdiction, Fishing, Shellfish, Low water mark, Boundaries (Property), Maps, Dam construction, Navigation, Flood control, Erosion control, Sea walls, Jetties, Docks, Marinas, Easements, Permits, Leases, Surveys, Sewerage, Administrative agencies, Bulkhead line.
Identifiers: *Marine resources, *Riparian owners.

All of the unconveyed beds of bays, rivers, creeks, and the shores of the sea within the jurisdiction of the state will continue and remain the property of the state. Such beds, and shores may be used by the people of the state for fishing and the taking of shellfish, subject to state law. The limits or bounds of land lying on bays, rivers, creeks, and shores, and the rights and privileges of the owners of such land, will extend to low water mark only. An exception exists where a creek or river has been conveyed by a special grant or compact. It is unlawful to trespass or encroach upon or take or use any materials from the beds of bays, rivers, creeks, and sea shores which are state property without first obtaining authority from the Marine Resources Commission, except for: (1) authorized dam construction; (2) uses of beds authorized under different code provisions; (3) approved construction of navigation and flood control projects; (4) seawalls and jetties for erosion control; (5) docks and landings for non-commercial use; (6) fills by riparian owners to their established bulkhead line; (7) facilities for public use or facilities owned or operated by any public service corporation; and (8) other uses authorized by the state legislature. The method of obtaining special permission from the Marine Resources Commission is specified. (Keith-Florida)

WATER-POWER DEVELOPMENT, CONSERVATION OF HYDROELECTRIC POWER DAMS AND WORKS.

Va Code Ann secs 62.1-80, 62.1-82, 62.1-83, 62.1-85, 62.1-90, 62.1-91, 62.1-95 (1968).

Descriptors: *Virginia, *Hydroelectric power, *Hydroelectric project licensing, *Dam construction, Hydroelectric plants, Electric power, Electric powerplants, Powerplants, Dams, Electric power industry, Electric power production, Water utilization, State governments, Federal government, Administrative agencies, Obstruction to flow, Navigable waters, Navigation, Regulation, Eminent domain, Riparian rights, Permits, River regulation.

The Water Power Act is to encourage water power development in Virginia. The State Corporation Commission controls and regulates such development. Nothing herein deprives any riparian owner of existing rights. No hydroelectric dam may be constructed across waters of the state unless such dam complies with the provisions of this Act. Persons proposing to construct dams must first obtain a license from the Commission. The Commission may reject license applications, require the modification of dam plans before issuing such license and may establish the terms and conditions thereof. Dams must not unreasonably obstruct navigation or stream flow, and where such dam is to be located across navigable waters of the United States the owner must make such provisions for navigation as are required by the Secretary of the Army. The value of a license must not be estimated in any valuation for rate making or for the acquisition by the state of property included in any licensed development. (Marsee-Florida)
W70-01175

RIGHT OF EMINENT DOMAIN OF PUBLIC SERVICE CORPORATIONS.
Va Code Ann sec 62.1-98 (1968).

Descriptors: *Virginia, *Eminent domain, *Riparian rights, *hydroelectric power, Condemnation, Compensation, Public utilities, Public lands, Dams, Reservoirs, Electric power production, Riparian land, Riparian waters, Flow, Highway relocation, Legislation, Legal aspects, Damages.
Identifiers: *Public service corporation.

Public service corporations producing hydroelectric power for public sale have the right of eminent domain. This right may be exercised to acquire all necessary lands, property, or rights including lands held for public or private, religious, charitable, educational, or cemetery purposes. Eminent domain is not available as against public-carrier railroads or any streets or alleys in municipalities. In the event of condemnation of roads or bridges, compensation and damages will include the cost of relocation and reconstruction. Riparian owners may be compensated for loss of water flow downstream caused by corporation facilities. (McDonough-Florida)

Descriptors: *Conservation, *Natural resources, Environment, *Ecology, Recreation, Creativity, Landscaping, Environmental engineering, Social values, Land management, *Land resources, City planning.
Identifiers: Landscapes, Professional development.

Despite a knowledge revolution in the last decade, challenges in all disciplines, including conservation, are greater today than ever before. The challenges are social, personal, professional, and technical; they apply to the experienced conservationist and to the neophyte. Six challenges that conservationists must overcome if a better life is to be created are: (1) the need to create and re-create a quality environment; (2) the ecology of leisure; (3) conservation of citysheds (synonymous with megalopolis); (4) landscape creativity; (5) cooperation in conservation; and (6) bringing minority groups into conservation. Conservationists must not be stereotyped as reserved, dedicated, well-trained scientists who maintain the status quo. They must be interested, involved, and creative in every facet of their work. Today's college graduate is well equipped in terms of education; with the modern tools, dollars, and facilities at his disposal, he is far better qualified than his counterpart a generation or two ago to create a better life for all. USE OF MEMBRANE FILTERS IN GRAVIMETRIC ANALYSES OF PARTICULATE MATTER IN NATURAL WATERS,
Dartmouth Coll., Hanover, N. H.; and Yale Univ., New Haven, Conn.
John S. Eaton, Gene E. Likens, and F. H. Bormann.
Water Resources Res, Vol 5, No 5, p 1151-1156, Oct 1969. 6 p, 4 fig, 1 tab, 7 ref.

Descriptors: *Filtration, *Analytical techniques, *Water analysis, *Gravimetric analysis, Weight, Adsorption, Drying, Temperature, Absorption.
Identifiers: Millipore filters.

The weights of membrane filters used in gravimetric analysis of water were significantly changed by electrostatic charge, leachable material within the filters, and absorption of atmospheric moisture. Millipore type HA filters lost an average of about 0.32% of their dry weight as leachable material when 6 liters of distilled water were filtered. About 165 ml were required to remove 50% of the total leachable material removed by 1000 ml. These filters absorbed moisture from the atmosphere very rapidly during the first minute of exposure and at a much slower rate thereafter. The leachable material contributed to moisture absorption. Desirable drying temperature and time for Millipore type HA filters was determined. Other filters were compared: recommendations for the use of these filters are given. (Knapp-USGS)

Descriptors: *Instrumentation, *Turbulent flow, *Velocity, *Anemometers, *Flow measurement, Calibrations, Conduits, Engineering structures, Fluctuation, Cooling.
Identifiers: *Hot wire anemometer, *Hot-film anemometers, Circular conduits.

Methods of the measurement of mean and fluctuating components of velocity in turbulent flow of water using hot-film or hot-wire anemometers were investigated. A circulating water loop of circular flow cross-section and specially designed probes were built. New refinements of measuring and calibrating techniques were developed. This applied particularly to hot films of conical shape for which a dimensionless cooling law is proposed. Measurements of turbulence intensities and spectra along the axis of a circular conduit were obtained with an accuracy which compared favorably with that of measurement in dynamically similar air flows. Identifiers: *Northeastern USSR, Electrical prospecting.

After a detailed critical analysis of the use of electrical prospecting methods in permafrost areas, a successful application of the vertical electrical methods for the determination of thickness of poorly-consolidated formations in the permafrost areas of the Berelekh, Delyankir, Khudzhakh, and Malyk-Siena River basins of northeastern Siberia is described. Some definite suggestions to improve the interpretation and the scope of application of the electrical prospecting method are also given. (Gabriel-USGS)

ON A SOIL AND GROUND WATER INVESTIGATION WITH THE SHALLOW REFRACTION METHOD AT MO I RANA,
Terratest A.B., Bromma (Sweden); and Swedish Geotechnical Inst., Stockholm.
B. Sjogren, and O. Wager.
Eng Geol, Vol 3, No 1, p 61-70, Jan 1969. 10 p, 7 fig, 6 ref.

Descriptors: *Seismic studies, *Geophysics, *Surveys, *Groundwater, Stratigraphy, Foundation investigations, Aquifers, Soil investigations, Water levels, Sands, Clays.
Identifiers: *Norway, Mo i Rana (Norway), Groundwater prospecting.

The shallow seismic refraction method--for more than 20 years well known as an useful tool for planning of dam sites, tunnels, roads and other construction works--has, during the last ten years also proved to be an excellent method to locate water-bearing fissured zones in bedrock, hidden by overburden. Furthermore, the method can be successfully applied to establish occurrence of different layers within the overburden. Seismic investigations at Mo i Rana, Norway, illustrate how a reliable picture of the subsurface conditions in an area with sand and clay deposits can be obtained with help of the fast seismic method. Also shown is the possibility of determining groundwater levels and directions of water flow. (Knapp-USGS)

AN INEXPENSIVE SHALLOW WATER TABLE PROBE,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
Fred Libby.
J Geol, Vol 77, No 5, p 626-628, Sept 1969. 3 p, 1 fig.

Descriptors: *Water levels, *Water table, *Groundwater, *Measurement, *Instrumentation, Sampling, Water measurement, Test procedures.
Identifiers: Groundwater level probe.

A method for rapidly determining shallow groundwater levels in sand and gravel profiles has been developed by the U.S. Department of Agriculture. By this method, an investigator can accurately determine depths to groundwater in a few minutes by direct measurement. The unit works in locations where the water table is almost 12 ft beneath the surface. The equipment required is simple, portable, and easily handled. It consists of a 13-ft-long, 3/8-inch-diam steel rod and driving ram. The steel rod has one-sixteenth of an inch holes drilled through it at 6-inch intervals. Couplings are of an electrical conduit type so that connections can be made without using wrenches. The rod is driven into the ground to its entire length with the driving ram and then extracted by hand. Upon extraction, the 6-inch-interval holes in the rod are examined to see which is the uppermost hole that contains water. This system for measuring shallow depths to the water table was used successfully on 2 consumptive-use surveys along the major length of the Santa Ynez River in California. (Knapp-USGS)

PHOTOGRAMMETRIC MEASUREMENT OF ROCK SURFACES IN A POWER TUNNEL,
Imperial Coll. of Science and Technology, London (England); Binnie and Partners, London (England); and Fairey Surveys Ltd. (Gr. Brit.).
D. E. Wright, D. E. Cox, and O. W. Cheffins.
Water Power, Vol 21, No 6, 7, p 230-234, 274-279, June-July 1969. 11 p, 14 fig, 3 tab, 9 ref, append.

Descriptors: *Profiles, *Photogrammetry, *Tunnels, *Surveying, *Stereoscopic, *Roughness (Hydraulic), *Tunnel hydraulics, Photographic equipment, Water tunnels (Conveyance), Photography, Surveying instruments, Underground structures, Stereoscopic map plotters, Roughness (Hydraulic), Roughness coefficient, Surfaces, Cross-sections.
Identifiers: Ground-based photogrammetry, Photographic analysis, Malaysia.

A photogrammetric method was used for measuring the shape of a 16-ft-dia hydroelectric power tunnel in Malaysia. Stereoscopic photographs were taken with a 4 x 5 Linhof Super Technika having a 150-mm lens; data were plotted using a Zeiss Stereoplanigraph C8. Professional photographic equipment can produce stereophotographs from which the position of the rock surface can be determined to an estimated accuracy of plus or minus 1/4 in. Over an area of 7 x 50 ft, control errors reduced the accuracy to plus or minus 1.3 in. Profiles can be plotted longitudinally or for cross sections. Details of the camera setup, surveying procedures, and plotting of data are given. (USBR)

EARTH RESOURCE SATELLITES,
Hawker Siddeley Dynamics Ltd., Hatfield (England).
G. K. C. Pardoe.
Sci J, Vol 5, No 6, p 58-67, June, 1969. 10 p, 10 fig, 5 ref.

Descriptors: *Aerial photography, Earth (Planet), Geology, Geography, Geologic investigations, Hydrology, Oceanography, Oceans, Maps, Land use, Surveys, Agriculture, Photographic equipment, Photographs, *Remote sensing, Resources, Resource development, *Natural resources, *Mapping, Sensors, *Reconnaissance surveys, Radar, *Satellites (Artificial).
Identifiers: Aerial reconnaissance, Airborne equipment, Airborne surveying, EROS (Acronym), Infrared photography.

Communications, meteorological, and navigation control satellites may have a large impact in private and public sectors and may make large profits for the nations owning them, but of all the direct-application sattellite systems envisioned, satellites for measuring the resources of the earth show the greatest promise of benefit to the world. The benefits will affect all mankind and will be manifest in terms of hard cash and in less direct ways that cannot be quantified in any detail. Study of these benefits shows that this will become a major application of satellite technology, and probably the greatest single direct use of space that can be foreseen. Advantages of satellite surveying include a continuous and regularly repeatable broad synoptic view of total earth cover over a long period, and low cost per unit of data collected. Sensors operating in different bands of the electromagnetic spectrum can measure a wide range of natural phenomena. Geologic, geographic, agricultural, and oceanographic applications are described. The equipment carried by satellites, handling of data, and administrative problems are discussed. Earth resource satellite programs in the U.S., the United Kingdom, and Europe are reviewed. (USBR)

MULTISENSOR ANALYSIS FOR SOILS MAPPING,
Bureau of Public Roads, Washington, D.C.; and Purdue Univ., Lafayette, Ind.
Harold T. Rib, and Robert D. Miles.
Highw Res Board, Spec Rep 102, p 22-37, 1969. 17 p, 6 fig, 1 plate, 2 tab, 5 ref.

Descriptors: *Soil classifications, *Soil engineering, Data reduction, Field data, Soil moisture, Aerial photography, *Radar, Data collections, Field classifications, Infrared rays, *Photography, Sensors, Ultraviolet rays, Analysis, *Remote sensing, Mapping.
Identifiers: *Soil maps, *Infrared photography, Photointerpretation, Test results, Infrared imagery, *Radar images, *Color photography.

A study project was instituted at Purdue University to investigate the potential of aerial films and sensors for detailed soils mapping. The first phase of the project was evaluating the potential of available types of aerial sensors and proposing a multisensor system for performing detailed engineering soils mapping. Results of the first phase study are described. During investigation of the various sensors, 9 flight coverages were made over 3 controlled test sites during a 13-mo period. Coverage was obtained using: (1) color positive, color infrared, color negative, black-and-white panchromatic, and black-and-white infrared aerial films; (2) a 9-lease multiband camera; (3) K-band radar sensors; (4) far infrared sensors, and (5) an ultraviolet through far infrared multichannel sensor. Not all combinations were used in any one flight program, but several combinations were used during each flight. The optimum system for delineating and mapping soils is a multichannel sensor flown simultaneously with an aerial mapping camera taking natural color photographs. Natural color was the most useful single film type. (USBR)

SURFACE AND SUBSURFACE EXPLORATION BY INFRARED SURVEYS,
Air Force Inst. of Tech., Wright-Patterson, AFB, Ohio; and Oklahoma State Univ., Stillwater.
R. V. Matalucci, and M. Abdel-Hady.
Highw Res Board, Spec Rep 102, p 1-12, 1969. 12 p, 13 fig, 19 ref.

Descriptors: *Aerial photography, Photography, *Infrared rays, Remote sensing, Sensors, *Infrared radiation, Instrumentation, Bibliographies, *Subsurface investigations, Pipelines, Planning, Locating, *Exploration, Mapping, Subsurface drainage, Geologic formations, Engineering geology, Reconnaissance surveys, Geologic mapping, Investigations.
Identifiers: *Infrared photography, Buried pipes, Photointerpretation, *Infrared detectors, Infrared imager, Infrared sensors, Infrared.

Basic principles relating to infrared radiation and demonstrating various applications of infrared photography and imagery to surface and subsurface exploration and terrain analysis for highway construction and other engineering projects are summarized. Infrared (IR) photography and imagery highlight variations in soil texture, composition, and moisture not usually recorded by conventional photography. The chlorophyll effect allows IR photography to assist in appraisal of cultivated land for right-of-way acquisitions. Hidden subsurface conditions and geological features of greatest importance during highway site selection and design, including muck pockets, underground cavities, volcanic and hydrothermal activities, subsurface drainage systems, and buried utilities and conduits can be exposed with IR instrumentation. Through further research in the techniques used for infrared remote sensing, surface and subsurface exploration and drainage studies for constructing highways, airports, and other projects may be greatly facilitated. (USBR)

STRENGTH TEST ON NEWLY FALLEN SNOW,
Forest Service (USDA), Salt Lake City, Utah. Alta Avalanche Study Center.
Ronald I. Perla.
USDA Forest Serv Res Note RM-150, 1969. 12 p.

Descriptors: *Snow, *Snow cover, *Snowpacks, *Measuring instruments, *Mechanical properties, On site tests, Shear stress, Strength, Physics.
Identifiers: Ram penetrometer, New snow, Drop cone penetrometer, Shear vane.

In situ strength tests previously applied to metamorphosed snow were modified to measure the mechanical properties of newly fallen snow during storms. A large drop cone penetrometer, protected from the wind by an aluminum shell, was used to determine snow 'hardness'. A lightweight model of the Haefeli ram penetrometer measured 'Ram Numbers.' Shear strengths were obtained from large, lightweight frames. Some preliminary tests were made with a shear vane driven by a torque wrench. A new technique was devised for measuring tensile strength: a cantilever beam of snow is undercut until it fails under its own weight.

RECORDS OF SELECTED WELLS AND SPRINGS IN THE RULISON PROJECT AREA, GARFIELD AND MESA COUNTIES, COLORADO,
Geological Survey, Denver, Colo.
Theodore R. Hurr, Woodrow W. Wilson, Frank A. Welder, and R. L. Emerson.
Geol Surv Open-file Rep, Sept 1969. 17 p, 1 fig, 1 plate, 3 tab, 3 ref. AEC Contract AT (29-2)-474.

Descriptors: *Data collections, *Hydrologic data, *Water wells, *Springs, *Colorado, Water levels, Water quality, Water yield.
Identifiers: Garfield County (Colo), Mesa County (Colo), Project Rulison, Well records.

An inventory of wells and springs in the Rulison project area and vicinity was made from March 20-April 3 and May 20-25, 1969, by the U S Geological Survey in cooperation with the U S Atomic Energy Commission. The project is an experimental study to determine the commercial feasibility of stimulating natural-gas production in the Rulison gas field by fracturing the resR. ERVOIR ROCITH A NUCLEAR EXPLOSION. The nuclear device will be implanted approximately 8,400 ft below land surface. The purpose of the study was to document the physical condition of wells and springs, and to collect samples of water prior to the nuclear event, for chemical analyses. During the field inventory, all wells and springs within a 10-km (6.2-mi) radius of the emplacement hole and selected wells and springs within the 10-km to 20-km (12.4-mi) radius were visited. Records of the inventoried wells and springs are given in tables, and their locations mapped. (Knapp-USGS)

GROUNDWATER IN SANTA BARBARA COUNTY, CALIFORNIA, SPRING 1967 TO SPRING 1968,
Geological Survey, Menlo Park, Calif.
R. E. Lewis.
Geol Surv Open-file Rep, May 1969. 30 p, 12 fig, 3 tab, 4 ref.

Descriptors: *Data collections, *Hydrologic data, *Groundwater, *California, Water levels, Water wells, Water utilization, Water quality, Water yield, Water storage, Water level fluctuations.
Identifiers: *Santa Barbara County (Calif).

Precipitation for the 1968 water year at Santa Barbara and Santa Maria was generally lower than the long-term average. Groundwater pumpage in the county was 307,000 acre-ft; this is an increase of 11,000 acre-ft over the amount estimated for the previous year but about equal to the annual average for the period 1963-67. Water levels were, on the average, slightly higher in most areas; as a result, estimates of change of groundwater in storage show a slight net increase over last year. In the Santa Maria Valley water level in one well in the southeastern part of the valley was about 86 ft higher, and groundwater in storage increased an estimated 176,000 acre-ft. Chemical analyses of water taken from wells during autumn 1967 show no significant change from analyses reported during the previous year, and there is no indication of intrusion of sea water in the coastal basins sampled. (Knapp-USGS)

DIGITIZED PHYSICAL DATA OF A RANGELAND WATERSHED,
Agricultural Research Service, Boise, Idaho. Northwest Watershed Research Center; and Agricultural Research Service, Beltsville, Md. Hydrograph Lab.
G. R. Stephenson, and C. B. England.
J Hydrol, Vol 8, No 4, p 442-450, Aug 1969. 9 p, 6 fig, 11 ref.

Descriptors: *Data collections, *Data processing, *Digital computers, *Range management, Water conservation, Mapping, Surveys, Geologic mapping, Distribution patterns, Hydrogeology, Photogrammetry, Terrain analysis, Topography.
Identifiers: Boise (Idaho), Reynolds Creek Experimental Watershed.

Digitizing and photogrammetric equipment can facilitate hydrologic studies by sampling mapped information and by reducing it from graphical to numerical form. Such digitized data lend themselves to mathematical and statistical treatments by use of computers. In addition, digitized information can be processed by a X-Y plotter to obtain terrain profiles. Digitizing, recording, and plotting equipment has been used for interpreting various physical land features of the earth. By drawing on the relationships between soils and other land features, an index of total porosity, or of water-holding capacity, has been developed for grouping soil mapping units on a rangeland watershed. Such a method of combining soils by using an overall index that is hydrologically significant can reduce computational complexity and increase efficiency in design of hydrologic experiments, thereby reducing their costs. Procedures are described for sampling and digitizing physical data and the consistency of physical relationships are evaluated preliminary to more exacting analyses. Data were collected in the Reynolds Creek Experimental Watershed by the Northwest Watershed Research Center, Boise, Idaho. (Knapp-USGS)

Nebraska Univ., Lincoln. Dept. of Horticulture and Forestry.
K. W. Brown, and Norman J. Rosenberg.
OWRR Project A-001-NEBR. Nebr Univ Coll Agr and Home Econ, Agr Exper Sta Rep MP23, July 1969. 35 p, 5 fig.

Descriptors: *Computer programs, *Digital computers, *Data processing, Hydrologic data, Publications, Documentation, Technical writing, Data storage and retrieval.
Identifiers: Computer data-plotting, Data presentation.

The use of multichannel automatic data recorders has necessitated the development of techniques for rapid analysis and presentation of data. A computer program was developed to plot time dependent data from a storage matrix. The body of the program, entitled TIMEPLOT, is written in FORTRAN IV. To minimize the run time required, the input and output subroutines are written in F level COBOL. Time, which may range from 1 hour to 16 days, is plotted on the abscissa. The program computes the intervals at which labels are placed and determines the required annotation. Data may be plotted as frequently as one observation per minute or as infrequently as one observation per day. The ordinate may represent any parameter. A single parameter may be plotted or several parameters may be superimposed upon each other. Combinations may be arranged on a single time axis. The program was designed with special features to facilitate the plotting of microclimatic, micrometeorological, and other types of time-dependent data. Plots drawn in india ink may be photographically reduced for use in reports and journal articles. Associated utility programs are also described. (Knapp-USGS)

ROLE OF PROGNOSIS OF GROUNDWATER STATE IN PROJECTION OF DAMS (POLISH),
Jan Flisowski.
English and Russian summaries. Przeglad Geol, Vol 17, No 7, p 347-352, 1969. 4 fig, 5 ref.

Descriptors: *Groundwater, *Reservoir leakage, *Dam design, *Water levels, Groundwater basins, Valleys, Rivers, Streamflow, Flooding, Water table, Water loss, Drainage systems, Engineering geology, Seepage, Water level fluctuations.
Identifiers: *Poland, Vistula River.

The effect of the projected Nowy Korczyn dam on the Vistula River, Poland, was investigated analyzing a river-drainage system-groundwater hydraulic scheme. The effect of groundwater ponding caused by dam construction on the development of a river valley depends not only on the height of river ponding, but also on the ponded water table in the near-dam reservoir. Water seepage can be determined on the basis of the preliminary forecasting studies of the immediate effect of river waters on groundwaters. If the near-dam reservoir is surrounded by side ramparts, the river valley is tranformed into a depression area subject to severe inundations. (Gabriel-USGS)

FINAL REPORT TO THE AMERICAN SOCIETY OF CIVIL ENGINEERS ON TASK 7 AND TASK 9 OF THE COMBINED SEWER SEPARATION PROJECT,
American Society of Civil Engineers, New York.
Robert N. Bowen, and John G. Havens.
Available from Clearinghouse as PB-185 992 at $3.00 in paper copy or $0.65 in microfiche. National Sanitation Foundation, ASCE Combined Sewer Separation Project, Dec 1967. 55 p, 18 fig, 4 tab, 14 ref. FWPCA Program No 11020 EKO.

Descriptors: *Construction materials, *Material testing, *On-site tests, *Pressure conduits, *Specifications.
Identifiers: *Cleaning procedures, *Conduit installation, *Fittings, *Plowing method, *Pressure sewer arrangements, *Sewer-within-sewer, *Special tools.

Assistance was provided in connection with special field trial installations of flexible tubing inserted in building sewers. Materials were proposed for pushing or pulling through a building sewer and a methodology and necessary attachments and tools were recommended. Polyethylene and polybutylene tubing are recommended for use inside building sewers and copper tubing for use in open trenches. A saddle type of connection is recommended for connection of pressure tubing to street pressure conduits. Cast iron, PVC, asbestos cement, or ductile iron are recommended for pressure conduits. Experience with plowing of pressure pipe is reviewed. Reference is made to standard practice for trench installations, street crossings and thrust blocking. Two methods of cleaning hose pressure tubing are proposed. Six possible layouts of pressure conduits are discussed in terms of operation and maintenance. All six arrangements provide for routine rerouting of flow by exploiting a dual conduit configuration. (Tucher-ASCE)

DEVELOP AND FIELD TEST METHOD OF INSTALLING PRESSURE CONDUITS IN COMBINED SEWERS,
American Society of Civil Engineers, New York.
Henry J. Kazienko.
Available from Clearinghouse as PB-186 005 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project, Johns-Manville R and D Center, Dec 30, 1968. 38 p, 15 fig, 9 tab. FWPCA Program No 11020 EKO.

Descriptors: *Design, *On-site-tests, Epoxy resins, Pressure conduit.
Identifiers: *Development, *Polyester conduit hanger, Allowable load, Combined sewer.

This report describes laboratory development and testing of polyester molded hangers cemented to a sewer pipe crown. Polyester hanger material formulations, epoxy cement, and hanger dimensions are specified, and methods of installation given in detail. Test of the hanger to failure in the laboratory showed fracture in tension through the conduit ring, leaving the upper part bonded to the concrete sewer crown. The field installation of 100-ft. of 3-in. diameter PVC pipe filled with water was made in a 7-ft. sewer in Evanston, Ill., in cooperation with the Metropolitan Sanitary District of Greater Chicago. The installation was sound and unaffected when removed after 4 1/2 months. (Tucker-ASCE)

REPORT ON PRESSURE SEWERAGE SYSTEM, SUMMER STREET SEPARATION STUDY AREA, BOSTON, MASSACHUSETTS,
American Society of Civil Engineers, New York; and Camp, Dresser and McKee, Boston, Mass.

Available from Clearinghouse as PB-186 000 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project, Report Sept 1968. 82 p, 24 fig, 16 tab, 10 ref. FWPCA Program No 11020 EKO.

Descriptors: *Cost analysis, *Design, Pressure conduit.
Identifiers: *Building plumbing separation, *Sewer separation, Boston (Mass), Gravity sewer, Sewage flow variations.

The report is one of three by consultants to study the design, estimate costs and evaluate the feasibility of the hypothetical application of the ASCE Project Scheme of pressure sewers for separation in representative combined sewer areas from layouts by the Project Staff. The Boston study considered the 53-acre gently sloping, heterogeneous commercial Summer Street Separation Study Area, including many buildings built in the late 1800's. The report describes the separation of building plumbing in detail in a typical three-quarter century old five story and basement commercial building 65-ft. by 145-ft. in plan, and estimates the cost of plumbing separation. Four alternative pressure sewer collection systems are indicated with plans and hydraulic profiles. Some systems included in-line main pumping stations. The least expensive complete pressure system, which did not include a main pumping station, is estimated to cost $6,400,000 compared to the cost of a gravity separation system designed by the consultants, estimated to cost $4,700,000. Both costs include costs of building plumbing separation, $4,000,000 for the pressure system including communitors, wet walls and non-clog pumps, and $2,000,000 for the gravity systems. (Tucker-ASCE)

COMBINED SEWER SEPARATION PROJECT, REPORT ON MILLWAUKEE STUDY AREA.
American Society of Civil Engineers, New York; Greeley and Hansen, Chicago, Ill.

Available from Clearinghouse as PB-186 003 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project Report, Dec 1968. 84 p, 12 fig, 10 tab, 11 ref. FWPCA Program No 11010 EKO.

Descriptors: *Annual costs, *Cost analyses, Design, Pressure conduit.
Identifiers: Building plumbing separation, Sewer separation, Gravity sewer, Milwaukee (Wis), Sewage flow variations, Storage-grinder-pump.

The report is one of three by consultants to study the design, estimate costs and evaluate the feasibility of the hypothetical application of the ASCE Project scheme of pressure sewers for separation in representative combined sewer areas from layouts by the Project staff. The Milwaukee study considered the 157-acre mainly dense residential, moderately sloping Prospect Avenue Study Area essentially built prior to 1930 with many buildings dating from before 1900. The report describes methods of building plumbing separation and indicates two alternative arrangements of pressure sewers with plans and a profile. Estimates of construction cost of each ($3,225,000 and $3,260,000) are compared with that of a conventional gravity system of separation designed by the consultant ($2,195,000). Plumbing separation, included in the above, is estimated to cost $912,000 for the gravity alternative and $971,000 for the pressure alternatives, not including storage-grinder-pump units. (Tucker-ASCE)

SEPARATION OF COMBINED WASTEWATER AND STORM DRAINAGE SYSTEMS, SAN FRANCISCO STUDY AREA.
Brown and Caldwell, San Francisco, Calif.

Available from Clearinghouse as PB-186 001 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project Report, Sept 1968. 81 p, 23 fig, 11 tab, 13 ref. FWPCA Program No 11020 EKO.

Descriptors: *Cost analysis, *Design, Pressure conduit.
Identifiers: *Building plumbing separation, *Sewer separation, Gravity sewer, Plumbing code, San Francisco (Calif), Storage-grinder pump.

The report is one of three by consultants to study the design, estimate costs and evaluate the feasibility of the hypothetical application of the ASCE Project Scheme of pressure sewers for separation in representative combined sewer areas from layouts by the Project staff. The San Francisco study considered the 323 acre predominantly residential, steeply sloping Laguna Street Sewer Service District, rebuilt since the 1906 fire. The report describes methods of building plumbing separation and indicates two alternative arrangements of pressure sewers, with plans and profiles. Estimates of construction cost of each ($13,000,000 and $13,350,000) are compared with that of a conventional gravity system of separation designed earlier by the City ($8,800,000). Plumbing separation, included in the above, is estimated to cost about $5,400,000 for the gravity method and about $4,400,000 for the pressure method not including storage-grinder-pump units. (Tucker-ASCE)
W70-01053

OUTLINE DESCRIPTION OF ASCE PROJECT ON 'SEPARATION OF SANITARY SEWAGE FROM COMBINED SYSTEMS OF SEWERAGE'.
American Society of Civil Engineers, New York.

Available from Clearinghouse as PB-185 995 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project, Technical Memorandum No 1, Feb 21, 1966. 9 p, 2 fig, 1 ref. FWPCA Program No 11020 EKO.

Descriptors: *Pressure conduits.
Identifiers: *Combined sewers, Comminuted sewage, Sewer separation.

Descriptions of the project separation scheme, project goal and project background are given. The general concept of the ASCE Project scheme is to pump comminuted sanitary sewage from individual buildings and building complexes through relatively small pressure tubing laid in existing building connections and thence into new pressure conduits suspended in existing street sewers. Potential advantages of the scheme are discussed. The ultimate goal of the Project is to develop feasible designs and operations and to put them to test in actual systems. The immediate objective is to examine and evaluate both the feasibility and probable cost. The background of the project is reviewed. Dr. Gordon M. Fair conceived the scheme on which the Project is based. An appendix summarizes the need for separation of combined sewerage systems and the national scope of the problem. (Tucker-ASCE)
W70-01054

STUDY OF APPROXIMATE LENGTHS AND SIZES OF COMBINED SEWERS IN MAJOR METROPOLITAN CENTERS,
American Society of Civil Engineers, New York.
Dasel E. Hallmark, and John G. Hendrickson.
Available from Clearinghouse as PB-185 999 at $3.00 in paper copy and $0.65 in microfilm. ASCE Combined Sewer Separation Project, Technical Memorandum No 4, May 1, 1967. 9 p, 2 tab. FWPCA Program No 11020 EKO.

Descriptors: *Sewers.
Identifiers: *Combined sewers, *Sewer sizes, *Combined sewer lengths, Walk-through sewers.

A tabulation is given for five major cities of mileage and percentage of combined sewers with heights: greater than 48 inches; equal to or less than 48 inches; and equal to or less than 24 inches. An average of 72 percent of the sewers are smaller than 24 inches. Heights of 54 inches and larger, classified as walk-through sewers, account for an average of about 15 percent of the total combined sewer mileage. (Tucker-ASCE)

Descriptors: *On-site tests, Conduits, Cost analysis, Trenches.
Identifiers: *Sewer-within-sewer, Building lateral, Copper tubing, Plastic tubing, Pressure sewers, Washington, D.C.

Three methods of installing pressure tubing from houses or small buildings, and of connecting the tubing with street pressure conduits, are described and discussed. One would be the installation and connection of pressure tubing and conduit in trenches by traditional water distribution methods. Field trials were conducted to indicate the feasibility of inserting tubing in building sewers. Tubing was pushed through an 86-foot long 4- 5-inch diameter building lateral, which included three 45 deg bends, from a specially dug pit at the upstream end into a 4-foot diameter combined sewer. The forward end of the tubing was guided by a special leader device. Three fourths-, 1-, and 1 1/2-inch polyethylene tubing could be pushed. Polybutylene and copper tubes could not be pushed because they buckled or crimped. A Kellems grip and swivel on the end of a rope were used to pull tubing from the combined sewer to the upstream pit. Three fourths-, 1-, and 1 1/4-inch polyethylene and 3/4- and 1-inch polybutylene could be pulled. Three fourths-inch copper tubing could not be pulled because of its stiffness. The third method, tested in the field, combined the insertion of tubing with a street main in trench. Cost estimates were made for the later two methods. (Tucker-ASCE)

NON-MECHANICAL CONSIDERATIONS INVOLVED IN IMPLEMENTING PRESSURIZED SEWERAGE SYSTEMS,
American Society of Civil Engineers, New York.
Donald H. Waller.
Available from Clearinghouse as PB-186 008 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project, Technical Memorandum No 12, May 31, 1968. 27 p, 1 tab, 4 ref. FWPCA Program No 11020 EKO.

Descriptors: *Administration, *Economic justification, *Legal aspects.
Identifiers: *Interviews, Radcliff (Ky), Storage-grinder-pump.

Installation of a storage-grinder-pump unit in every home raises questions regarding: allocation of costs of the units; responsibility for malfunction of the units; arrangments for service of the units; and willingness of owners to accept the presence of units in their buildings. Twenty-five householders in Radcliff, Kentucky, whose houses are served by sewage ejector units were interviewed to obtain opinions about features of the units that appeared to represent potential sources of nuisance, inconvenience, or other liabilities. Also interviewed were the superintendent of the utility operating the Radcliff sewerage system, owners of five houses in Louisville, Kentucky, at which sewage sampling stations were located, and three consulting engineering firms who have considered schemes involving the installation of sewage pumping equipment on private properties. Opinions and practices reported reflect the view that sewage pumping equipment placed on private property as part of a public project should be purchased, installed, and serviced at public expense. (Tucker-ASCE)

SPECIAL REQUIREMENTS FOR A FULL SCALE FIELD DEMONSTRATION OF THE ASCE COMBINED SEWER SEPARATION PROJECT SCHEME,
American Society of Civil Engineers, New York.
Donald H. Waller.

Available from Clearinghouse as PB-186 009 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project, Technical Memorandum No 13, June 3, 1968. 84 p, 12 fig, 13 tab, 10 ref. FWPCA Program No 11020 EKO.

Descriptors: *Benefits, *Costs, Anaerobic conditions, Legal aspects, Measurement, Overflow.
Identifiers: *Field demonstration planning, Flow obstructions, Interviews, Public cooperation, Sewer separation, Storage-grinder-pump.

Matters that should be considered in planning a field demonstration of the ASCE Project pressure sewer scheme are summarized. These include: importance of connecting as many buildings as possible in the demonstration project area; need for protection from overflows of building storage-grinder-pump units; relationship between occurrence of overflows from buildings and given levels of public inspection, detection and control; effectiveness of alarms on storage-grinder-pump units; legal agreements with property owners; importance of complete records of project costs; effectiveness of the project as a pollution control measure; possible benefits of elimination of infiltration from interceptors and treatment plants; detection and clearing of obstructions; use of polymer additives to reduce fluid friction; behavior of unground sewage including anaerobic decomposition; self-cleansing characteristics of flow; rate and extent of deterioration of friction factors; sewage flow variations and their relationship to water demands; handling of interruptions of service; and field tests on installations in walk-through combined sewers. The appendix is an assessment of the physical problems to be overcome in separation of plumbing on private property, with estimates of cost, based on information from officials in seven large cities having combined sewers, and from a consulting engineer and a recent American Public Works Association survey. ROUTING OF FLOWS IN SANITARY SEWERAGE SYSTEMS,
American Society of Civil Engineers, New York.
L. Scott Tucker.
Available from Clearinghouse as PB-186 010 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project, Technical Memorandum No 14, July 18, 1969. 39 p, 15 fig, 1 tab, 8 ref. FWPCA Program No 11020 EKO.

Descriptors: *Attenuation, Hydrographs, Pressure conduits, Water demand.
Identifiers: *Flow routing, *Theoretical moments, Dwelling units, Mean Milwaukee (Wis), Nodes, Peak flow, Skewness, Variance.

Water demand data from individual homes, assumed to represent sewage flows, were combined by routing into a 10-home input unit. These input units were then routed through a hypothetical pressure sewer collection system via a hydrograph superposition procedure. The hypothetical pressure sewer system served 3,270 dwelling units. The ratio of peak flow to the two-week average flow was 2.7 at the outlet. Similar analyses of portions of the pressure system consisting of 1,000 and 250 dwelling units were made. The ratio of peak to the two-week average for the 1,000 dwelling unit portion of system was 3.5, and for the 250 dwelling unit portion of the system was 4.0. A method of analysis based on notes and calculations of Professor H. A. Thomas of Harvard U. involving theoretical moments of frequency distributions is presented. The method is explained by applying it to a simple example of a sewage collection system. The method provides an estimate of peak flows and time of occurrence, and has a potential for examining parameter sensitivity. (Tucker-ASCE)

Identifiers: *Seismic tests, *Double-curvature arch dams, Earthquake loads, Great Britain, Republic of So Africa, Test results, Dynamic tests.

Use of high-speed digital computers in the application of a new technique of earthquake design to study seismic behavior of an arch dam is described. This study applies to the Hendrik Verwoerd Dam on the Orange River, Republic of South Africa. The technique (based on use of finite elements) takes full account of dynamic response of a structure to an earthquake, providing a complete history of stresses and deflections within the arch during the passage of the earthquake. To avoid an enormous printout of noncritical information, provision is made to print only the maximum envelope of principal stresses and deflections and times of occurrences. A printout can be provided of the instantaneous state of stress and deflection of the structure for any given moment which, from examination of the times of the occurrence of the maxima, is particularly significant. Scale model tests of the dam are described whereby critical frequencies of vibration, predicted by mathematical analysis, were subsequently verified by a method of multipoint vibration resonance tests. Results of tests using these new techniques are compared with the classical method of earthquake analysis, indicating dynamic stresses in certain parts of the dam were underestimated by factors of 2 or 3. Identifiers: *California Aqueduct, California Department of Water Res, San Joaquin Valley (Calif), Systems engineering, Emergency closures.

The design of the California Aqueduct Project by the California Department of Water Resources considered the scheme of operation as an integral component of the physical design of the system. The scheme was based on an analysis of existing water delivery projects, definition of project functions, and extensive analysis, including computer simulation. Developing a controlled volume concept of operation and design for remote control made possible greater reliability, more efficient operation, and rapid response in emergencies. The result is an aqueduct designed and constructed to reliably, efficiently, and economically deliver water to the San Joaquin Valley and Southern California. A greater degree of safety and reliability is provided than was possible by traditional design and operation methods. (USBR)

ANALYTICAL SOLUTION FOR TURBULENT FLOW IN PIPES,
Universidad Central de Venezuela, Caracas. Dept. of Engineering.
A. Zagustin, and K. Zagustin.
La Houille Blanche, No 2, p 113-118, 1969. 3 fig, 1 append.

Descriptors: *Turbulent flow, *Pipes, *Pipe flow, Velocity, Mixing, Eddies, Viscosity, Theoretical analysis, Equations, Energy equation.
Identifiers: *Circular pipe, Differential equations, Pulsation energy.

New analytical expressions are given for the velocity, mixing length and eddy viscosity for turbulent flow in a smooth circular pipe. These expressions are obtained from a set of differential equations for turbulent flow plus a 'balance of pulsation energy' equation. The present theoretical results agree better with the experimental data than those of earlier theories, and furthermore, in contrast to earlier theories, the velocity distribution curve has no singularity at the center line. NON-LINEAR FREE SURFACES IN OPEN CHANNELS (FRENCH),
Centre National de la Recherche Scientifique, Chatillon-sous-Bagneux (France). Centre de Calcul Analogique.
C. Bellevaux, and D. Fruman.
La Houille Blanche, No 2, p 119-122, 1969. 7 fig, 7 ref.

Descriptors: *Open channels, *Free surfaces, *Open channel flow, *Flow, *Supercritical flow, Subcritical flow, Measurement, Equilibrium, Stability.
Identifiers: Non-linear free surfaces, Sills.

A calculation method is presented for free flow surfaces with sills. Use of transformed plan enables the free surface position to be established. The non-linear surface equilibrium condition is met by successive approximation. Two calculation schemes are presented, one for supercritical flow and the other for subcritical flow. A stability study shows only the former scheme to be stable; the subcritical scheme will not converge unless modified. The scope of the method is illustrated by examples. (Carstea-USGS)

PROPAGATION OF WAVE-FRONTS IN WIDE CHANNELS OF ARBITRARY CROSS-SECTION,
Leeds Univ. (England).
G. D. Crapper.
La Houille Blanche, No 2, p 123-126, 1969. 6 fig, 3 ref.

Descriptors: *Waves (Water), *Channels, *Open channel flow, *Unsteady flow, Cross-sections, Hydraulics, Channel flow, Equations, Mathematical studies.
Identifiers: *Wave-front propagation, Triangular-section open channels.

A simple method for predicting the movement of a wave-front and a measure of its strength in a system described by hyperbolic partial differential equations is adapted from published work and applied to channel hydraulics. The equations are applicable to any channel configuration including longitudinal and transversal channel variations. A solution for a channel with a triangular cross-section is discussed. The wave-fron splits along the centerline and the initial disturbance moves away to the sides of the channel. (Carstea-USGS)

EXPERIMENTAL RESEARCH ON SPILLWAY SHAFT FLOW (FRENCH),
Liege Univ. (Belgium).
A. Schlag.
La Houille Blanche, No 2, p 127-136, 1969. 23 fig, 1 tab.

Descriptors: *Closed conduit flow, *Shafts (Excavation), *Spillways, *Research and development, Discharge (Water), Pressure head, Froude number, Weirs, Pipe flow, Pipes, Mathematical studies, Orifice flow.
Identifiers: Weir flow, Pressure pipe flow.

The relationships between vertical-shaft spillway discharge, head at the shaft and diameter and length of the column are studied. The relationship between the non-dimensional factors of head/diameter, length/diameter, and Froude number is also establshed. Depending on the Froude number, the following cases of flow are possible: (1) weir flow giving a parabolic curve with a horizontal axis; (2) pressure pipe flow giving a parabola with a vertical axis; (3) orifice flow under certain discharge conditions and for Froude number of about 0.5. A different type of orifice flow is produced by a momentary outside influence. Formulae are presented and discussed for 3 forms of flow. (Carstea-USGS)

DETECTION OF CAVITATION BY ACOUSTIC AND VIBRATION-MEASUREMENT METHODS,
Technical Univ. of Budapest (Hungary). Dept. of Hydraulic Machinery.
J. J. Varga, G. Sebestyen, and A. Fay.
La Houille Blanche, No 2, p 137-149, 1969. 26 fig, 24 ref.

Descriptors: *Cavitation, *Vibrations, *Acoustics, Pumps, Turbines, Tunnels, Flow, Velocity, Erosion.
Identifiers: *Cavitation detection, Noise measurement, Cavitation erosion.

The validity of acoustic methods for incipient cavitation determination is confirmed by measurements of noise from pumps and Francis turbines in a cavitation tunnel. Cavitational flow shows two noise-generating sources: (1) the noise produced by flow conditions, emitted at a discrete frequency; (2) the noise produced by the collapse of the cavitation bubbles, which covers a wide frequency band. Acceleration level measurements seem to be much more advantageous than the sound pressure level measurements. The intensity of cavitation erosion is highly correlated with the intensity of the noise. Noise intensity is proportional to the fifth power of velocity under cavitation conditions. (Carstea-USGS)

ANALYTICAL STUDIES OF TURBULENT FRICTION IN ANNULAR CONDUITS,
American Society of Civil Engineers, New York.
Alan R. Nelson, and James M. Robertson.
Available from Clearinghouse as PB-186 002 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project, University of Illinois, T and AM Report No 321, Nov 1968. 81 p, 38 fig, 5 tab, 16 ref. FWPCA Program No 11020 EKO.

Descriptors: *Flow rates, *Pressure conduits, *Roughness, Digital computer, Head loss, Turbulent flow.
Identifiers: *Annular pipes, *Eccentricity, *Radius ratio, *Velocity distribution, Diessler and Taylor, Sewer-within-sewer.

An analytical solution for fully developed turbulent flow in an annular conduit is presented, performed with the aid of a digital computer. To account for the observed divergence of the velocity traverses of recent investigations with increasing ratio of radius of inside wall of outside pipe to radius of outside of inserted pipe, a modified wall law-core law velocity formulation is adopted. The effect of variations in radius ratio, eccentricity, and roughness upon the location of maximum velocity, velocity distribution, and friction are discussed. The radius of maximum velocity is found to be nearer the wall of the inserted pipe for smooth annuli and is independent of Reynolds number for values greater than 40,000. Friction decreases with increased eccentricity but is considerably less affected by changes in the radius ratio. Variations in wall roughness cause the greatest alteration in the flow occurrences in annular conduits. Using the modified two-law velocity distribution, a new prediction of friction is given for the limiting case of radius ratio approaching unity. Even though equivalent magnitudes were not achieved for experimental and analytical results, the trends are similar. (Tucker-ASCE)

TURBULENT FRICTION IN ECCENTRIC ANNULAR CONDUITS,
American Society of Civil Engineers, New York.
James M. Robertson.
Available from Clearinghouse as PB-185 993 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project, Univ of Illinois, T and AM Report No 310, Mar 1968. 63 p, 13 fig, 3 tab, 48 ref. FWPCA Program No 11020 EKO.

Descriptors: *Flow around objects, *Head loss, *Pressure conduits, Data collections, Flow rates.
Identifiers: *Annular pipes, *Hangers, Eccentricity, Sewer-within-sewer.

Following a general review of the analytical and experimental information on the friction loss encountered by fluids flowing in annular pipes, with particular regard to the influence of eccentricity of the inner member, experiments are described on an evaluation of the friction of water in a steel annular pipe of diameter ratios 5.8 and 3.2 in the Reynolds number range of ten to the fifth power to ten to the sixth power. It is found that on a discharge basis, for the same head loss in a given length, with the diameter ratio of 5.8 the flow capacity of the pipe line is decreased 12.7% in the concentric situation but only 4.5% with full eccentricity. The latter decrease is not greatly different from the 3% reduction in area due to the inserted smaller pipe. An analysis is included showing that for the simple insert at full eccentricity the near-full-flow capacity of a sewer is little affected. The effects of hangers such as might be employed to support inserts in sewers is found to have an appreciable effect on the flow capacity of a full-flowing sewer. (Tucker-ASCE)
W70-01046

RELATIONSHIP OF SEWAGE CHARACTERISTICS TO CARRYING VELOCITY FOR PRESSURE SEWERS,
American Society of Civil Engineers, New York.
M. Floyd Hobbs.
Available from Clearinghouse as PB-185 991 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project, FMC Corporation Report No R-2598, Aug 1967. 96 p, 10 fig, 54 tab, 2 ref. FWPCA program No 11020 EKO.

Descriptors: *Data collections, *Deposition (Sewage sediments), *Pressure conduit, *Scour.
Identifiers: *Sand concentration, *Sewage analysis, Comminutor, Grinder, Santa Clara (Calif).

Minimum carrying velocities for solid phase matter in smooth plastic 2 in., 3 in., 4 in., 6 in., and 8 in. pressure pipes were measured using comminuted and uncomminuted raw sewage. The minimum velocity for scouring and the maximum velocity for depositing were essentially the same. Velocities appeared to be independent of: the concentration magnitudes of suspended solids, fixed suspended solids, sand concentration, and the size distribution of suspended matter and sand for the sewages studied. Velocities appeared to be dependent on the fixed solids content or sand which accumulated on the pipe bottom. Egg shells that had been passed through a garbage grinder were carried at lower flow rates than required for moving the bottom sediments. Carrying velocities were investigated in an 8 in. spiral pressure pipe but the results obtained were very erratic. Tests were also made on the 8 in. plain plastic pipe with open channel flow. All data acquired are reported. (Tucker-ASCE)

LONG-TERM OPERATION OF WASTEWATER OBSERVATION STATIONS (TASK 2),
American Society of Civil Engineers, New York.
R. Paul Farrell.
Available from Clearinghouse as PB-185 994 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project, General Electric Co Report No S-68-1064, Apr 24, 1968. 48 p 12 fig, 13 tab, 5 ref. FWPCA Program No 11020 EKO.

Descriptors: *Maintenance, *Pressure conduit, Data collections, Laboratory tests.
Identifiers: *Operating experience, *Wastewater sampling stations, check valve operation, On-site observations, Plumbing fixture tests, Pump operation, Sewage flow (Household).

In the terminal phase of operation of two household wastewater observation stations, the stations were operated for seven months during which the principal objective was collection of usage experience. The two garbage grinders were never a source of difficulty. The 3/4-inch check valves regularly trapped fibrous or stringy materials. A significant increase in head loss in the 3/4-inch discharge tubing in the last month of operation at one station is attributed to a thick coating of anaerobic slime on the interior walls, attributed to low inflow rates and extended periods of disuse. The 1-inch tubing at the other station was essentially clean throughout the tests. Results of fixture flow tests, and information on overflows from the station wet-wells, was obtained to supplement results of the earlier studies. (Tucker-ASCE)

SAMPLING AND ANALYSIS OF WASTE WATER FROM INDIVIDUAL HOMES (TASK 2),
American Society of Civil Engineers, New York.
R. P. Farrell, J. S. Anderson, and J. L. Setser.
Available from Clearinghouse as PB-185 990 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project, General Electric Co Report No 67-MAL-3, Mar 24, 1967. 79 p, 16 fig, 17 tab, 8 ref. FWPCA Program No 11020 EKO.

Descriptors: *Data collections, *Laboratory tests, *Water demand (Household), Hydrographs, Peak discharge, Telemetry.
Identifiers: *Sewage flow (Household), *Wastewater sampling stations, Domestic wastes grinder, Louisville (Ky), Plumbing fixture tests.

The results of the initial phase of operation of two household wastewater observation stations are described. During a three month period household wastewater was sampled for analysis, wastewater flow rates were measured, and the behavior of components when handling wastewater under actual conditions of use was observed. Each station included a garbage grinder for reduction of incoming sewage solids sizes, a float well and level recorder, a pump and pump operation time

recorder, a check valve on the pump discharge line, and fifty feet of clear plastic discharge tubing. An extensive program of sampling and analysis was carried out to characterize completely the wastewater from each home. Particulate matter in the wastewater was analyzed over an intensive seven-day period to determine its exact nature in terms of particle size, density and microscopic appearance. Analyses were made of water demand data obtained from measurements at one gallon intervals at each house telemetered to recording equipment. A set of fixture tests, during which fixtures were discharged singly and in combinations in preplanned sequences, was run at both stations to obtain information on water and sewage flow patterns for fixtures. (Tucker-ASCE)

SEWAGE FLOW VARIATIONS IN INDIVIDUAL HOMES,
American Society of Civil Engineers, New York.
L. Scott Tucker.
Available from Clearinghouse as PB-185 996 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project, Technical Memorandum No 2, Feb 24, 1967. 70 p, 7 fig, 25 tab, 2 ref. FWPCA Program No 11020 EKO.

Descriptors: *Water demand (Household), *Data collections, Pumping, Storage, Design, Pipe, Distribution patterns.
Identifiers: *Peak demands, *Sewage flow (Household), Flow routing.

Winter water demands are assumed to represent sewage flows in the absence of sewage flow data. Two sets of 1-minute interval household water demand data are used: from six homes in Maryland for two weeks, and from two homes in Louisville for four weeks. Maximum and minimum 24-hour and 60-, 15-, and 4-minute demands for each day are given for each home. Frequency distributions of 24-hour and 60-minute flows for each sample are compared with each other and with distributions of total flows from groups of 3 houses and 6 houses. Based on routing of peak flows from nearly five hundred home-days of data through various storage-pump combinations, a pump capacity of 10 GPM and a usable storage capacity of 30 gal. are indicated for initial sizing of household storage-grinder-pump units. Pressure discharge tubing to handle expected flows at reasonable head losses would be 3/4 to 1 1/4 inch I.D. (Tucker-ASCE)
W70-01055

MINIMUM TRANSPORT VELOCITY FOR PRESSURIZED SANITARY SEWERS,
American Society of Civil Engineers, New York.
Murray B. McPherson, L. Scott Tucker, and M. Floyd Hobbs.
Available from Clearinghouse as PB-186 013 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project, Technical Memorandum No 7, Nov 16, 1967. 23 p, 4 fig, 2 tab, 8 ref. FWPCA Program No 11020 EKO.

Descriptors: *Deposition (Sewage sediments), *Pressure conduits, *Scour, Data collections, Design criteria, Regression analysis.
Identifiers: *Sand concentration, *Sewage analysis, *Transport velocity, Comminution, Grinding, Sanitary sewage.

Raw sewage, with and without particle-size reduction by comminution, was pumped through 2-in. to 8-in. clear plastic pipe. Extensive observation indicated rather conclusively that the material last to be scoured and first to be deposited was predominantly sand. For all tests, the sewage was salted with ground egg shells but these were always moved at lower mean flow velocities than the sand, which was in low concentrations, viz., 8 to 78 ppm. No discernable difference was noted in the minimum transport velocities for comminuted and uncomminuted sewage, and the difference between minimum scouring velocities and maximum depositing velocities was small. Test results were blended with those from sand transport experiments elsewhere for general representation. Exploratory open channel tests were made with the 8-in. pipe for a firmer correlation with sand tests. Results are presented in terms of dimensionless parameters. Limited tests were made on 8-in. spiral corrugated pipe. (Tucker-ASCE)
W70-01060

DOMESTIC SEWAGE FLOW CRITERIA FOR EVALUATION OF PROJECT SCHEME TO ACTUAL COMBINED SEWER DRAINAGE AREAS,
American Society of Civil Engineers, New York.
Murray B. McPherson.
Available from Clearinghouse as PB-186 014 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project, Technical Memorandum No 8, Nov 17, 1967. 19 p, 2 fig, 3 tab, 9 ref. FWPCA Program No 11020 EKO.

Descriptors: *Design criteria, *Water demand (Residential), Data collections.
Identifiers: *Domestic water use, *Peak demands, Demand variations, Sewage flow.

Residential sewage flow criteria are developed for use in design of pressurized sanitary sewers for hypothetical applications of the ASCE Project scheme. In a typical combined sewer area, data on domestic water demands is the most that can be expected to be available. On the basis of a study of winter water demand data it is concluded that projection of such observed demands for a service area to the end of the design period is the preferred basis of design. Data for California and the northeastern United States are presented separately. For each region, design curves represent the variation, as a function of the number of dwelling units served, of flows for the minimum 24 hours, for the peak hour of the minimum day, and for the maximum peak hour of any day, expressed as ratios to the annual average rate. (Tucker-ASCE)
W70-01061

PEAK FLOWS OF SEWAGE FROM INDIVIDUAL HOUSES,
American Society of Civil Engineers, New York.
Donald H. Waller.
Available from Clearinghouse as PB-186 015 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project, Technical Memorandum No 9, Jan 1, 1968. 117 p, 45 fig, 23 tab, 15 ref. FWPCA Program No 11020 EKO.

Descriptors: *Peak discharge, *Water demand (Household), Data collections, Plumbing.
Identifiers: *Plumbing fixture tests, *Sewage flow (Household), *Synthesized peak discharges, Louisville (Ky), Sampling stations.

Sewage flows and water demands measured at two household observation stations, as well as water and wastewater flows from individual fixtures and appliances is used to estimate upper limits of pump and storage capacities for a storage-grinder-pump unit for individual homes and to examine the relationship between peak rates of sewage flow and corresponding water demand rates. For individual fixtures, combinations of rate, duration and frequency of discharge that will produce maximum hydraulic loading conditions are selected. Single-fixture hydrographs are combined to produce synthetic hydrographs of peak period sewage discharge, from which combinations of storage and pump capacities are derived. Peak sewage flows and simultaneous water demands for a fourteen day period at one house are presented and analysed. (Tucker-ASCE)

CONVERGENT STILLING BASINS,
Liverpool Univ. (England).
R. B. Whittington, and K. H. M. Ali.
Inst Civ Eng Proc, Vol 43, p 157-173, June, 1969. 17 p, 18 fig, 2 tab, 8 ref.

Descriptors: *Stilling basins, Energy dissipation, Hydraulics, Foreign design practices, Supercritical flow, *Drowned (Submerged), Hydraulic jump, Froude number, Submergence, Spillways, Water surface profiles, Foreign research, Shock waves, Hydraulic models, Energy losses.
Identifiers: *Convergence, *Converging flow, Sweepout, Submerged flow, Great Britain.

Operation of convergent stilling basins in the drowned jump condition is discussed. Particular attention is paid to the occurrence of sweepout. When a basin is fully swept out, the flow in the basin remains supercritical, and the basin is then ineffective as an energy dissipator. A momentum equation is given for calculating the backing-up depth at the entrance to the basin; this yields good agreement with experimental results. The observed phenomena are compared to Ippen's fundamental work on oblique shock waves. Special reference is made to the stilling basin for the Llys-Y-Fran Dam under construction in Great Britain. (USBR)
W70-01099

HYDRAULIC PROPERTIES OF SMALL UNLINED ROCK TUNNELS,
Helsinki City Waterworks (Finland).
Seppo Priha.
Proc Amer Soc Civ Eng, J Hydraul Div, Vol 95, No HY4, p 1181-1209, July 1969. 29 p, 27 fig, 9 tab, 10 ref, 2 append.

Descriptors: *Water tunnels (Conveyance), *Tunnel hydraulics, Foreign design practices, *Tunnels, *Roughness (Hydraulic), Cross sections, Model tests, Reynolds number, Pressure tunnels, Hydraulic models, *Hydraulic properties.
Identifiers: *Unlined tunnels, Finland, *Friction coefficient (Hyd).

Factors influencing hydraulic characteristics of small unlined tunnel cross sections are presented. Investigations were performed in rock tunnels constructed by the Helsinki City Waterworks for conveying raw water. The length of the Silvola Reservoir entrance tunnel is 1.8 km; the theoretical cross section is 4.5 sq m. The length of the Silvola-Vanhakaupunki raw water tunnel is 7.6 km; the theoretical cross section is 6 sq m. Vertical shafts divided both tunnels into 3 parts, in all of which cross-sectional measurements and pressure loss measurements for different discharges were accomplished using measuring weirs and Siemens Venturi meters. All 3 tunnels were excavated by the so-called Swedish method in the most usual type of rock in Finland, composed mostly of granite and gneiss. (USBR)

ON THE CONCEPT OF MEAN HYDRAULIC RADIUS,
West Virginia Univ., Morgantown.
Desmond F. Moore.
Proc Amer Soc Civ Eng, J Hydraul Div, Vol 95, No HY4, p 1305-1319, July 1969. 15 p, 6 fig, 3 tab, 8 ref, 4 append.

Descriptors: *Hydraulic radius, Hydraulics, Open channels, Fluid flow, Open channel flow, Roughness coefficient, Roughness (Hydraulic), Viscous flow, Instrumentation, Laminar flow, Forecasting.
Identifiers: Aspect ratio, Rugosity, *Hydraulic diameter.

The flow rate through any channel may be predicted by using the hydrodynamic analogy between the torsion of a uniform bar with arbitrary cross section and viscous flow through a channel of the same shape. Parameters required are: (1) computation of the aspect ratio of the cross section of the channel; (2) measurement of the area using a

planimeter; (3) measurement of the wetted perimeter of flow; and (4) observation of the number of significant sides composing the cross section. The mean hydraulic radius may be obtained as the quotient of (2) and (3). The parameter is then modified by (1) and (4) to improve the accuracy of the prediction. The same concepts may be used for channels having variable shapes and sizes along their lengths. In such cases, an equivalent area is defined in the computation of hydraulic radius according to a method outlined in the appendix. Experimental support for the concepts proposed has been furnished from extensive tests using plates with regular and random asperites. The validity of the mean hydraulic radius concept has led to the development of a scientific outflow instrument capable of predicting the drainage ability of road surfaces subjected to pneumatic tire traffic. HEAD LOSSES CAUSED BY AN ICE COVER ON OPEN CHANNELS,
Worcester Polytechnic Inst., Mass.
Peter A. Larsen.
J Boston Soc Civ Eng, Vol 56, No 1, p 45-67, Jan 1969. 23 p, 20 fig, 4 ref.

Descriptors: *Head loss, *Energy losses, *Open channels, *Open channel flow, *Ice, Hydraulics, *Roughness coefficient, Hydraulic design, Water surface profiles, Roughness (Hydraulic), Canals, Mannings equation, Foreign research.
Identifiers: *Ice cover, Sweden.

A rational formula for composite roughness, based on the concept of logarithmic velocity distribution, was developed; field data relative to the roughness of the ice cover on 2 Swedish power channels are reported. The undersurface of ice on a channel had irregularities formed by the flowing water. The effect of these irregularities corresponds to a certain roughness expressible in terms of an equivalent roughness height. The mechanics of the formation are not known, and predicting the roughness of the ice cover on a channel of given hydraulic characteristics and climatic conditions is not possible. The formula derived for composite roughness is based on the assumption of 2 parallel (or slightly converging) boundaries, an assumption merely limiting the applicability to the case considered in this paper. The approach to this problem may be applicable in an attempt to develop a more general solution to the problem of composite roughness. The need for such a solution is obvious for design purposes and laboratory use; gathering field data on the ice cover roughness phenomenon should continue. (USBR)

NEW PROBLEMS IN THE THEORY OF BOTTOM CURRENTS IN RESERVOIRS,
Politekhnicheskii Institut, Leningrad (USSR).
I. I. Levi.
Transl from Russ, Bur Reclam Transl 784, Aug 1969. 19 p, 4 fig, 2 tab. Izv Vses Inst Gidrotekh, No 78, p 71-82, 1965.

Descriptors: Hydraulics, *Density currents, *Reservoirs, Mathematical analysis, Reservoir operation, Reynolds number, Laminar flow, Turbidity, Open channel flow, Velocity, Suspended sediments, Roughness (Hydraulic), Boundary layers, *Velocity distribution, Experimental data, Stratified flow, Foreign research, Depth, Currents (Water).
Identifiers: USSR, Reverse flow, Current patterns.

Bottom currents usually form in mountain reservoirs when the depth is greater than 30 to 40 m with suspended sediments of more than 3 to 4 kg/cu m. Unit discharges and depth of water can reach large magnitudes. Under these conditions, the assumption of disregarding movement in the upper zone of the reservoir cannot always be considered valid. The problem of velocity distribution in reservoirs during formation of bottom currents is examined. Differential equations are given for determining the movement of the bottom flow. Values are established for the normal and critical depths of bottom flow, surface velocities, reverse flows, and the line of zero velocities. Equations are derived for a reservoir with a horizontal bottom. The analysis broadens concepts of steady, nonuniform motion of fluids of different densities in reservoirs, making possible a mathematical determination of velocity distribution curves and line of zero velocity in reservoirs. CHARACTERISTIC PRESSURE DISTRIBUTION IN OUTLET WORKS INLETS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Robert G. Cox, and Yen H. Chu.
Miscellaneous Paper H-69-8, Sept 1969. 12 p, 24 fig, 17 ref.

Descriptors: *Outlet works, *Intakes, *Pressures, Hydraulic models, Flow.

Report summarizes a study of inlet pressures measured in nine hydraulic models and two laboratory investigations of entrance designs for flood control outlet works. The experimental data are examined to determine the effects of upstream face geometry, guide piers, and bulkhead and gate slots. Both two-dimensional and three-dimensional flow inlets are considered and compared with free-streamline inlets. The results are presented graphically in terms of dimensionless pressure drop coefficients for use in estimating pressure conditions to be expected in design practice. Design criteria are recommended. (Spivey - Waterways Experiment Station)

SPILLWAY FOR REND LAKE RESERVOIR, BIG MUDDY RIVER, ILLINOIS; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Bobby P. Fletcher, and John L. Grace.
Sponsored by US Army Engineer District, St. Louis. Technical Report H-69-7, May 1969. 15 p, 1 tab, 7 photo, 11 pl.

Descriptors: *Spillways, *Hydraulic models, Stilling basins, Riprap, Flow, Channels, Laboratory tests.
Identifiers: *Rend Lake Reservoir, Big Muddy River.

Test of spillway were conducted with a 1:16-scale model that reproduced a 129-ft length of the 435-ft-long main spillway to study adequacy of spillway, stilling basin, and exit channel protective stone. After completion of tests concerned with the notched portion of spillway, the notch was filled in and the model revised to permit study of flow conditions at right abutment. Approximately 250 ft of approach channel and 500 ft of exit channel were reproduced. Particular emphasis was placed upon selection of a stilling basin downstream of the notched section. Flow conditions in the approach, at the right abutment, and over the main spillway were satisfactory. Capacity of the spillway as determined by the model was approximately the same as computed. Performance of the original stilling basin was unsatisfactory in dissipation of all spillway discharges due primarily to high unit discharge through the notched section. Four alternate designs were investigated and a stilling basin was developed which proved satisfactory. Model tests indicated that riprap proposed in the approach for the original design was adequate. ADVANCED DEVELOPMENT OF HOUSEHOLD PUMP-STORAGE-GRINDER UNIT (TASK 6),
American Society of Civil Engineers, New York.
R. Paul Farrell.
Available from Clearinghouse as PB-186 004 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project, General Electric Co Report No S-69-1038, Dec 1968. 74 p 22 fig, 7 tab, 10 ref. FWPCA Program No 11020 EKO.

Descriptors: *Capital costs, *Design, *Installation costs, *Operating costs, Performance, Pump.
Identifiers: *Check valve, *Development, *Grinding, Storage-grinder-pump.

This report describes the development, by the General Electric Company for the ASCE Project, of a 150-pound household storage-grinder-pump unit comprising a domestic sewage grinder and progressing-cavity pump driven by a 1-h.p., 1725-r.p.m. motor, and mounted on a 58-gallon receiver tank, meeting criteria established by the Project investigation. The unit is capable of discharging through a backflow valve and 1 1/4-in. outlet at 15-gpm at atmospheric pressure and 11-gpm at 35 psig pressure. The estimated cost of the unit without tank is $343, and estimated total installed costs are $548 for new work and $648 where cutting and patching are involved. Cost of energy for operation is about $2 per year. (Tucker-ASCE)

EXPERIENCE WITH GRINDING AND PUMPING OF SEWAGE FROM BUILDINGS,
American Society of Civil Engineers, New York.
Donald H. Waller.
Available from Clearinghouse as two reports as PB-185 997 and PB-185 998 at $3.00 in paper copy or $0.65 in microfiche per report. ASCE Combined Sewer Separation Project, Technical Memoranda Nos 3 May 1, 1967, and 3A, Mar 1, 1968. 102 p and 47 p respectively. FWPCA Program No 11020 EKO.

Descriptors: *Maintenance, *Operations, *Pumping, Pipes, Valves, Water reuse.
Identifiers: *Comminutors, *Garbage grinders, Liljendahl, Vacuum system.

In TM No. 3, a typical garbage grinder is described and use of grinders for toilet wastes is reviewed. Two wet process building-waste pulping systems and two machines that combine the functions of grinding and pumping are described. Practice in the use of pumps, piping and backflow valves for sewage in buildings is reviewed. An appendix describes the Liljendahl vacuum sewerage system. Results of monitoring the operation of thirty-six comminutor installations that serve individual buildings are reported in TM No. 3A. The monitoring program, which covered periods of up to sixteen months, is described. Descriptions and prior operating histories of the installations are included. Frequency of attention and maintenance is recorded and compared with manufacturers' recommendations. Twenty-five of the machines were inspected at least five times each week. Twenty-four of the installations include sewage pumps following the comminutors with discharge mains 3 to 6 inches in diameter. An appendix contains a summary description of a system developed at Pennsylvania State University for conservation of water in residences by recycling. (Tucker-ASCE)
W70-01056

HYDRAULICS OF A PRESSURIZED SEWERAGE SYSTEM AND USE OF CENTRIFUGAL PUMPS,
American Society of Civil Engineers, New York.
L. Scott Tucker.
Available from Clearinghouse as PB-186 012 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project, Technical Memorandum No 6, Nov 15, 1967. 35 p, 14 fig, 1 tab, 12 ref. FWPCA Program No 11020 EKO.

Descriptors: *Pumps (Centrifugal), Flow characteristics, Hydraulics.
Identifiers: *Pump characteristics, Control valves, Pressure sewers, Total dynamic head.

Hydraulic gradients for high and low sewage flows and the use of pressure control devices for service zones and interceptors applicable to pressure sewer systems are illustrated and discussed. For some flat drainage areas sewage pumping, in addition to pumping provided by pumps located in buildings, would be necessary; a pressure control assembly would be needed immediately upstream and a surge control valve would be used immediately downstream of a lift station. For steep drainage areas, pressure control assemblies would be needed to limit maximum pressures. Centrifugal pump characteristics are discussed and information on thirty-two classes of sewage and solids handling pumps is tabulated. Characteristics for centrifugal pumps capable of pumping sewage are such that maximum reasonable limits on discharge rates would be greatly exceeded if variations in total dynamic head were allowed to equal curb pressure variations that are expected in some parts of a pressure sewer system. Ordinary use of centrifugal pumps in these cases would be precluded. A possible modification of building pumping systems with a valve controlled to maintain a constant discharge pressure is discussed, together with the use of variable speed drivers. (Tucker-ASCE)
W70-01059

CONTROL TECHNIQUES FOR PRESSURIZED SEWERAGE SYSTEMS,
American Society of Civil Engineers, New York.
James R. Daneker, and William H. Frazel.
Available from Clearinghouse as PB-186 007 at $3.00 in paper copy or $0.65 in microfiche. ASCE Combined Sewer Separation Project, Technical Memorandum No 11, Mar 4, 1968. 27 p, 11 fig. FWPCA Program No 11010 EKO.

Descriptors: *Butterfly valves, Pressure conduits, Venturi meters.
Identifiers: *Control systems, *Flow control, *Pressure control, Electronic systems, Fail safe designs, Hydro-electric systems, Hydro-pneumatic systems, Magnetic flow meter, Peumatic systems, Tranducers.

Instrumentation and control of a pressurized sewer system can be attained with current technology, and special designs are foreseen that can approach zero maintenance. A rubber-seated butterfly valve is recommended for the basic control element. For 'system No. 1' a fixed pressure is maintained upstream of the control valve by modulation of the valve to correct or reduce any deviation of measured pressure from a selected set point. A pressure sensing element would be directly connected to the control valve. For 'system No. 2' the control valve would be modulated to maintain a specific upstream pressure corresponding to every rate of flow measured at a flow sensing element. A venturi type or magnetic meter could be used for measurement of flow, and a transducer (with a changeable cam that could be cut in the field) would be required to generate some characterized signal that would actuate the control valve. 'System No. 3' would apply to a booster or lift station and the start-stop sequence of a centrifugal pump would be controlled to permit starting without surge and to maintain a constant discharge pressure. For a booster station the pump speed would be varied in response to suction pressure. For nearly fool-proof fail-safe control, all-hydraulic control systems are recommended in preference to pneumatic, hydro-pneumatic, or electronic systems. (Tucker-ASCE)

ELECTRICAL DESIGN OF PARAMETERS USED FOR EHV SYSTEMS,
Westinghouse Electric Corp., Pittsburgh, Pa.
C. L. Wagner.
Transm Distrib, Vol 21, No 6, p 63-69, June, 1969. 7 p, 6 fig, 2 tab, 9 ref.

Descriptors: *Extra high voltage, *Transmission lines, Conductors, *Electrical design, Systems analysis, Lightning arresters, Economics, Electrical coronas, Radio interference, Electric insulation, Costs, Electrical insulators, Electrical equipment, Transmission (Electrical).
Identifiers: *Ultra high voltage, Switching surges, Short circuits, Transient stability, Lightning surges, Withstand level (Electric).

Electrical design of ehv systems can be separated into 4 parts: system analysis, conductor specification, line insulation, and equipment insulation. Although based on 500-kv system studies, the methods discussed apply to all ehv and uhv systems, and might be used for systems of 230 kv and below. Examples used are results of 500-kv design studies. Various factors concerning transmission system analysis are discussed. Conductor selection for ehv is dependent upon several interrelated variables considered from the overall operating and economic aspect. Line insulation requirements depend upon normal and transient conditions. Transmission lines designed for satisfactory lightning and switching surge performance are adequate for 60-hz conditions. The correct insulation level for equipment is an important application problem in ehv. A general method for determining correct insulation and results therefrom are summarized. (USBR)
W70-01093

UPLIFT RESISTANCE OF ANCHOR BAR, AUGER AND PRESSED PLATE FOOTINGS IN SANDY SILT,
Bureau of Reclamation, Denver, Colo.
James M. Horner.
Bur Reclam Rep No EM-768, May, 1969. 60 p, 43 fig, 5 tab, 1 ref, append.

Descriptors: Field tests, *Footings, Transmission towers, Silts, Loads (Forces), Movement, Soil properties, Soil mechanics, Soil tests, Lateral forces, Geometry, Arizona, Ponding, Soil strength, Shear strength, Soil moisture, Sands, *Anchored towers.
Identifiers: Mead-Liberty Transmission Line, *Uplift resistance, Pullout tests, Belled footings, *Anchored footings, Auger-type footings.

Four types of transmission tower footings were tested under uplift loads to determine load-movement performance. The performance of the anchor bar footing in sandy silt was of special interest. The straight auger, belled auger, and pressed plate footings were tested to provide a comparison with the anchor bar footing results. Each footing was tested in natural and ponded soils conditions. For the anchor bar footing at vertical failure movement (1/2 in.), the load resisted was over 110 kips in natural soil and about 115 kips in ponded soil. For the other 3 types of footings, loads at vertical failure movement were: 55 to 105 kips for straight auger, 80 to 100 kips for belled auger, and 17.5 to 25.0 kips for pressed plate. Design loads were 28.7 kips for concrete footings and from 14.1 to 18.0 kips for pressed plate footings. Soil samples were analyzed in the laboratory. A method of predicting failure loads for the anchor bar footings using the soil test results was attempted, but no consistent results were obtained. (USBR)
W70-01096

FIELD TEST RESULTS ON 113,000 KW FRANCIS PUMP-TURBINES FOR NAGANO POWER STATION,
Electric Power Development Co. (Japan); and Hitachi Ltd., Hitachi City (Japan).
Katsuro Suzuki, and Kakehiko Yamamoto.
Hitachi Rev, Vol 18, No 6, p 228-234, May, 1969. 7 p, 14 fig, 1 tab, 5 ref.

Descriptors: *Pump turbines, *Field tests, *Performance tests, Test procedures, Model tests, Prototype tests, Noise, Reduction, Water hammer, Vibrations, Characteristics, Calculations, Electronic equipment, Computers, *Francis turbines, Hydraulic turbines.
Identifiers: *Test results, Japan foreign testing, Load rejection, *Reversible turbines.

Results of field tests conducted on the 113,000-kw, 111-m-head, reversible pump turbines for Nagano Powerplant, Japan, are discussed. These units are the largest of their kind in Japan and went into commercial operation in July 1968. Before manufacturing the equipment, various site operation tests were conducted; results were considered carefully with those of various model tests performed prior to manufacture of the prototype pump turbines to determine operational performance of the units. Principal data gained are discharge-versus-power characteristics, starting characteristics, transient phenomena at load and input rejection, and vibration information. Partial-load noise in the turbine was studied. Improvement in runner cone design was the most effective method of noise reduction. Changeover time from one mode of operation to the other was measured. (USBR)
W70-01097

IMPROVED DIGITAL SIMULATION FOR ANALYZING POWER SYSTEM DISTURBANCES,
Westinghouse Electric Corp., Pittsburgh, Pa.
C. J. Baldwin, and R. T. Byerly.
Westinghouse Eng, Vol 29, No 4, p 109-116, July 1969. 8 p, 8 fig.

Descriptors: *Electrical studies, *Digital computers, *Power system operations, *Electrical stability, *Simulation, *SComputers, Direct current, Computer programming, Transmission lines, Alternating current, Analysis, Excitation, Electric Power production, Governors, Hydroelectric power, Thermal power, Electric relays, Voltage regulators, Disturbances.
Identifiers: *Power system stability, *Interconnected systems, Load shedding, Synchronous machines, System stability (Elect).

A digital computer program incorporating recent advances in power systems analysis techniques provides a powerful tool for studying system stability following a fault or loss of generation, transmission, or load. Stability can be evaluated effectively by this new program, accommodating as many as 2000 buses, 3000 lines, and 600 generating units. Systems having 100 generating plants have been studied by this method. The increased size and detail of the new system simulation program is made possible by the availability of new large-memory digital computers. This new approach to systems analysis is discussed and sample output tabulations for simulations made with the computer program are given. Interconnection planning studies in the western United States have given momentum to much of the program development in recent years. (USBR)

INCREASING THE CAVITATION RESISTANCE OF PARTS BY USING EXPLOSIVE-WELDED FACINGS,
A. S. Gel'man, N. I. Pylaev, and B. D. Tsemakhovich.
Transl from Russ, Bur Reclam Transl 462, Aug 1969. 9 p, 1 fig, 3 ref. Energomashinostr, No 12, p 34-35, 1967.

Descriptors: *Manufacturing, *Cavitation, *Hydraulic turbines, Turbine parts, Turbine blades, Laboratory tests, Testing machines, Adhesion, Test procedures, Foreign research, *Welding, Stainless steel, Materials testing, Metals treatment, *Metal coatings, Heat treatment.
Identifiers: USSR, *Explosive welding, *Cavitation control, *Cladding, *Cavitation resistance, Metal bonding, Low carbon steel.

Facing metal parts by explosive welding of stainless steel strips to low-carbon steel base of machinery

parts has been developed and tested by several USSR institutes. Because of the degree to which the Francis and Kaplan turbine water passages are subject to cavitation, recent testing was conducted to study the effect of explosive welding cladding of blades on cavitation resistance. In explosive welding, the charge is deposited uniformly on the facing surface some distance from the part being clad. The explosion moves the facing at great speed toward the part. A pressure of 100,000 atm causes a jet to be thrown out of the contact zone, carrying with it acids and waste products. High pressure and plastic shear cause the metal to turn to a semiliquid state, forming a strong bond. Advantages are: removing the need for heating welded parts, welding metal difficult to weld normally, and attaining high static and fatigue strength of faced parts. Cavitation resistance of specimens faced with the stainless steels tested by explosive welding is not inferior to the initial resistance of these steels. Explosive welding produces a strong welded bond meeting conditions of repeated and variable microimpacts. (USBR)

8D. Soil Mechanics

CERTAIN ASPECTS OF ENGINEERING GEOLOGY IN PERMAFROST,
Army Terrestrial Sciences Center, Hanover, N.H.
G. K. Swinzow.
Eng Geol, Vol 3, No 3, p 177-215, July 1969. 39 p, 12 fig, 3 tab, 51 ref.

Descriptors: *Permafrost, *Engineering geology, *Frozen ground, *Rheology, Mining engineering, Tunnels, Frost heaving, Soil mechanics, Ice, Freezing, Thawing, Soil types, Foundation investigations.
Identifiers: Permafrost engineering.

The principal topics of engineering geology in permafrost are reviewed. Permafrost is defined and soil mechanical properties, rheology, patterned ground, ice wedges, pingoes, and icings are described. Although the strength of frozen soil is much greater than that of unfrozen soil, frozen soil creep and movement of thawed permafrost are severe engineering problems to be solved. Tunneling and mining problems, highway construction, road building, and airfield building and operation are briefly described. (Knapp-USGS)
W70-01011

DETERMINING PORE PRESSURE IN SLIGHTLY PERMEABLE SOILS IN THE BODY OF A DAM DURING THE PROCESS OF THEIR CONSOLIDATION,
A. A. Nichiporovich, and T. I. Tsybul'nik.
Translated from Trudy VIDGEO, No 4, p 5-37, 1963. Bur Reclam Transl 561, July 1969. 40 p, 23 fig, 5 tab, 18 ref.

Descriptors: *Pore pressure, *Earth dams, Cores, Consolidation, Creep, Soil moisture, Experimental data, Investigations, Calculations, Moisture content, Filtration, Plasticity index, Foreign research, Soils, Stress, Yield point, Soil mechanics, Saturation, Groundwater, Bibliographies, Soil density, Mathematical analysis.
Identifiers: USSR, Hydrodynamic pressures, Dynamic loads, Nurek Dam, USSR, Finite difference method.

When erecting comparatively high dams from local materials, the profile of which contains a core made from soil having a low filtration coefficient, excess pore pressure builds up in these soils during consolidation. During periods of construction and operation of the dam, the resistance to creep depends on the magnitude of the pore pressure; the greater the pore pressure, the lower the resistance of the tenacious soils to slip. An especially high pore pressure can occur either in soils under the effect of high stresses occurring in high dams or with comparatively low stresses but in insufficiently dense and waterlogged soil. The existing theoretical and experimental methods of determining pore pressure are analyzed and experiments for determining the pore pressure are described. Validity for using this index as a function of soil density and moisture in designing earth dams in confirmed, but different methods should be used on various types and dimensions of earth dams. The distinctive features of each method are given. Pore pressure diagrams are presented from determinations made under laboratory conditions; data are compared with those for the Nurek Dam, USSR. (USBR)
W70-01091

ADVANTAGES AND LIMITATIONS OF THE OBSERVATIONAL METHOD IN APPLIED SOIL MECHANICS,
Illinois Univ., Urbana.
R. B. Peck.
Geotech, Vol 19, No 2, p 171-187, June, 1969. 17 p, 7 fig, 8 ref.

Descriptors: *Soil mechanics, Construction, Foundations, Design, Earth dams, Dam design, Foundation investigations, Design criteria, Subsurface investigations, Foundation failure, Optimum design, Pore pressure, Soil stabilization, Subsidence, Settlement (Structural), Change orders, Structural stability, Engineering geology.
Identifiers: Terzaghi, *Observational method, Rankine lectures, Cost savings, Problem solving, Progressive failures.

The observational method, used so successfully by Terzaghi in applied soil mechanics, often permits maximum economy and assurance of safety, provided the design can be modified as construction progresses. Essential features of the method are set forth and examples of the application are given. The method is not without pitfalls and limitations. It should not be used unless the designer has a plan of action in mind for every unfavorable situation that might be disclosed by the observations. The observations must be reliable, reveal the significant phenomena, and be so reported as to encourage prompt action. The possibility of progressive failure may introduce a serious element of uncertainty. The essential ingredient is the visualization of all possible eventualities and the preparation in advance of courses of action to meet whatever situation develops. In spite of the limitations of the observational method, the potential for saving time and money without sacrificing safety is so great that engineers dealing with applied soil mechanics should be informed of the principal features of the method. (USBR)
W70-01092

A SEMI-EMPIRICAL METHOD FOR DETERMINING STRESSES BENEATH EMBANKMENTS,
Middle East Technical Univ., Ankara (Turkey).
T. Mirata.
Geotech, Vol 19, No 2, p 188-204, June, 1969. 17 p, 8 fig, 15 ref.

Descriptors: Soil engineering, Soil mechanics, Earth dams, Foreign design practices, Earth materials, Earth movements, *Embankments, *Foundations, *Stress analysis, Calculations, Displacements, *Stress, *Deformation, Bibliographies, Shear stress, Settlement (Structural), Shear.
Identifiers: Embankment subsidence, Turkey, Horizontal displacements, Vertical displacements.

Available methods for complete solution of stresses and displacements within and beneath embankments are either experimental or numerical, involving recourse to a digital computer with all the necessary ancillary work. Calculating settlements and lateral deformations using a slide rule and a few tables and charts results in making oversimplifying assumptions that may lead to unnecessarily high errors. A semi-empirical method is presented to bridge the gap between intricate computations and intolerable inaccuracy in determining deformations beneath embankments. The method requires no specialized training and yields reasonably accurate results. Attention is concentrated on foundation stresses, but the procedure can be used for estimating vertical and horizontal stresses within the embankment. The method is applicable to embankments on semi-infinite foundations and those resting on an elastic layer. (USBR)

CONTROLLING THE EXPANSION OF DESICCATED CLAYS DURING CONSTRUCTION,
Bureau of Reclamation, Denver, Colo.
J. P. Bara.
Pap, Second Int Res Eng Conf Expansive Clay Soils, Texas A and M Univ, College Station, Aug 1969. 27 p, 10 fig, 14 ref.

Descriptors: *Expansive clays, Canals, *Canal construction, Shrinkage, Canal design, *Canal embankments, *Foundation investigations, Moisture content, Central Valley Project, Soil moisture, Soil stabilization, Soil tests, Liquid limits, Canal linings, Sprinkling, Compaction, California, Construction, Cracks, Ponding, Ponding tests, Soil mechanics, Control.
Identifiers: *San Luis Unit (Calif), Desiccation, *Controlled expansion.

Expansive clays have been creating foundation problems in construction for centuries. Canal performance records show that continuous concrete linings can be virtually destroyed by expanding clay foundations unless precautions are taken. Control measures developed for identifying and reducing the expansive potential of foundation clays are described. These methods are being used by the Bureau of Reclamation in constructing the San Luis Drain, San Luis Unit, Central Valley Project, Calif. Three schemes for stabilizing expansive clays are discussed. Foundation soils for the San Luis Drain were investigated; foundation moisture control criteria were developed; test sections were established to evaluate construction methods; control requirements for embankments built of fat clay were established; and construction procedures for controlling expansion of clay foundations and embankments were developed. DECKED ROCKFILL DAMS,
Hydro-Electric Commission, Tasmania.
J. K. Wilkins.
Inst Eng, Aust Giv Eng Trans, Vol CE 10, No 1, p 119-129, Apr 1968. 11 p, 17 fig, 2 tab, 10 ref, 3 append, disc.

Descriptors: *Rockfill dams, *Impervious membranes, Cutoffs, Reviews, Dam foundations, Impervious blankets, Dam design, Shear strength, Dams, Asphaltic concrete, Density, Settlement, Compaction, Foreign design practices, Strain, Stress, Deformation, Calculations, *Membranes, Reinforced concrete, Small structures.
Identifiers: *Dam facings, Australia, *Facings.

The concept of building a dam by making a bank of gravel or rock and covering the upstream face with a waterproof membrane or deck is simple. Successful small dams of this type have been built in many parts of the world. No design of a mathematical nature is necessary if (1) the foundation is hard (compacted gravel or rock), (2) the fill material is strong, (3) an adequate cutoff to impervious material is constructed, (4) the membrane is reasonably watertight, (5) the dam is low

preferably below 50 ft high), and (6) the slopes are no steeper than 37 deg to the horizontal. Existing design and construction practices are reviewed and troubles arising from decked rockfill dams discussed. A method of computing strains and stresses in the decking material caused by movements of the fill was developed. Comparisons are made between computed strains and strains recorded at Salt Springs Dam in the U.S. Recommendations are given for reducing cost and improving the performance of concrete-faced and asphaltic-concrete-faced dams. STRENGTH OF DISCONTINUOUS ROCKS IN DIRECT SHEAR,
New Brunswick Univ., Fredericton.
E. Z. Lajtai.
Geotech, Vol 19, No 2, p 218-233, June, 1969. 18 p, 18 fig, 7 ref.

Descriptors: *Shear strength, Shear stress, Shear tests, Shear planes, *Shear failures, Rock mechanics, Tensile strength, *Direct shear, Joints (Geology), Fractures (Geology), Friction, Internal friction, Strength of materials, Failure (Mechanics), *Discontinuities, *Rocks.
Identifiers: Weakness planes, Foreign testing, Canada, Rock tests, Ultimate strength.

The strength of discontinuous rocks under direct shear loading is examined analytically and experimentally. In the direct shear test, a homogeneous and isotropic block of rock may fail by 3 mechanisms: failure in tension, failure in shear, and failure at ultimate strength. Strength parameters include tensile strength, fundamental shear strength (cohesion), angle of internal friction at ultimate strength, and the normal stress on plane of enforced shear. The direct shear strength of planes of weakness, oriented in the plane of enforced shear, is derived from the strength of soild rock and joint friction along the separated parts of the shear surface. Maximum shear strength develops only if soild strength and joint friction are mobilized simultaneously at the same deformation. (USBR)
W70-01101

A LABORATORY INVESTIGATION OF BOREHOLE STABILITY,
Shell Development Co., Modesto, Calif.
H. C. H. Darley.
J Petrol Technol, p 883-892, July 1969. 10 p, 9 fig, 4 tab, 6 ref.

Descriptors: *Shales, *Boreholes, *Drill holes, Rock properties, Drilling, Drilling fluids, *Expansion, *Deformation, Swelling, Stability, Montmorillonite, Laboratory tests, Collapse, Failure (Mechanics), Permeability, Failures, Earth pressure.
Identifiers: Spalling, Unstable ground.

The principal causes of unstable boreholes and the classes of troublesome shales have been known for many years, but there still are difficulties in identifying the cause of hole problems and consequently in selecting the right technique for combatting them. A laboratory study was undertaken on the basic mechanisms causing borehole instability in shales. The chemistry and physics of shales are reviewed, tests are developed for characterizing shales, and a model was constructed to study borehole stability. Reconstituted shale specimens were subjected to triaxial stresses and various fluids were circulated through an axially drilled hole in the specimen. The experimental program established 3 particular failure mechanisms: changes in borehole diameter caused by swelling, hole enlargement in brittle shales, and instability caused by high earth stresses. (USBR)
W70-01107

HYDRAULIC DESIGN OF UNLINED ROCK TUNNELS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Carl J. Huval.
Proc Amer Soc Civ Eng, J Hydraul Div, Vol 95, No HY4, p 1235-1246, July 1969. 12 p, 5 fig, 2 tab, 24 ref, 2 append.

Descriptors: Hydraulics, *Tunnel hydraulics, *Tunnels, *Hydraulic design, Overbreak, *Tunnel design, Flow resistance, Mannings equation, Roughness coefficient, Hydraulic structures, Overexcavation, Linings correlation techniques, Diversion tunnels, Hydroelectric power, Water tunnels (Conveyance), Water tunnels (Testing), Bibliographies, Rocks.
Identifiers: *Unlined tunnels, Rock traps.

Many unlined rock tunnels have been built for flood flow diversion and for hydropower tunnels where the rock is of sound quality and not greatly jointed and fractured. The number of unlined rock tunnels will increase in the years ahead because new methods of drilling, blasting, and muck removal have been developed and improved to make tunnel construction more economical. Methods of tunnel stabilization, such as grouting and use of rock bolts, have been improved so that many kinds of rock and difficult driving conditions can be handled more flexibly. Savings of unlined rock tunnels in time and cost of construction have been demonstrated by the ready acceptance of this type of tunnel in Sweden, Norway, Australia, and the United States. Unlined rock tunnel resistance coefficients can be predicted by using a rock overbreak parameter. The important considerations entering into design of unlined rock tunnels are summarized. The present method of predicting hydraulic resistance is inadequate. A study of tunnel rock overbreak experience leads to a relation between rock overbreak and tunnel size. This measure of rock overbreak provides a simple correlation of flow resistance test results based on the fully rough flow equation. (USBR)
W70-01114

RELATION BETWEEN THE STATIC AND THE DYNAMIC DEFORMATION INDEXES OF ROCK IN LARGE-SCALE TESTS ON ROCK MASSES,
S. B. Ukhov, and A. S. Panenkov.
Hydrotech Constr, No 11, p 996-1001, Nov 1968. 6 p, 5 fig, 13 ref.

Descriptors: *Rock foundations, *Rock mechanics, Dam foundations, Test procedures, Foundation investigations, Field tests, Static tests, Rocks, Field investigations, *Deformation, *Elasticity modulus, Experimental data, Correlation techniques, Fissures (Geology), Engineering geology, Rock properties, Sandstones, Schists.
Identifiers: *Deformation modulus, Rock tests, USSR, Foreign testing, *Plate load tests, Ultrasonic tests, Dynamic tests, In situ tests.

A correlation between dynamic modulus of elasticity and the static moduli of total deformation was established on large-scale tests of rock foundations. Static and dynamic tests were made in adits in the foundation rock of Andizhansk and Kirovsk Dams in the USSR. Static moduli of deformation were determined by applying loads of 40 kg/sq cm through concrete plates. Dynamic moduli were determined by ultrasonic instruments operating at frequencies of 25 to 100 kc/sec. The instruments were placed in boreholes drilled along the perimeter of the concrete loading plate. Tests were made on 5 types of rock: massive sandstone, laminated sandstone, and 3 types of schist. An analysis of experimental techniques and principles of test data interpretation was made in evaluating the relation between static and dynamic deformation indexes. The application of indirect and direct correlation techniques is discussed. Results obtained by direct correlation of experimental data show good agreement. The proposed correlation may be used in investigating deformation indexes of fissured rock masses under standardized static testing conditions. (USBR)

8F. Concrete

CRACKS IN BLOCKS OF THE BRATSK HYDROELECTRIC STATION DAM,
S. Ia. Eidel'man, and L. P. Trapeznikov.
Transl from Russ, Bur Reclam Transl 691, July 1969. 20 fig, 2 tab, 22 ref. Izv Vses Nauch-Issled Inst Gidrotekh, Vol 79, p 41-70, 1965.

Descriptors: *Cracks, *Concrete dams, Creep, Strain gages, Expansion, Stress, Tensile stress, Plastic deformation, Deformation, Heating, Test procedures, Temperature, Foreign research, Safety factors, Construction joints, Compression, Tensile strength, Instrumentation, Bibliographies, Concrete technology, Foreign projects.
Identifiers: *Crack control, USSR, Crack propagation, Foreign testing, *Bratsk Dam (USSR), Test results, Cold climates.

Preventing temperature cracks in mass concrete has always been a problem in dam construction. Intensive cracking of early dams stimulated theoretical and experimental studies, and engineering measures were devised for maintaining the monolithic nature of concrete dams. These measures, including concrete temperature control and breaking the structure by joints, have reduced temperature cracking. Results of field observations on temperature cracking in the massive concrete dam at Bratsk, USSR, and the factors causing these cracks are analyzed. Many remote-controlled strain gages embedded in the blocks of the dam for studying internal stress conditions were either in or near the cracks. This permitted determining the moment of cracking, the stress condition prior to this process,

and the dynamics of crack development. Of particular interest are the data on internal cracks, unobtainable through ordinary visual observations. (USBR)

ELECTRON BEAMS APPLY AN OLD PRINCIPLE TO MODERN ROCK-BREAKING,
Westinghouse Electric Corp., Pittsburgh, Pa.
B. W. Schumacher.
Eng Mining J, Vol 170, No 6, p 116-119, June, 1969. 4 p, 7 fig, 1 tab.

Descriptors: *Rock excavation, Rocks, Rock mechanics, *Electron beams, Engineering geology, *Cutting, Drilling, Drilling equipment, Electrons, Concretes, Melting, Tunneling, Penetration, Vaporization, Construction, Quarrying.
Identifiers: *Rock breakage, Rock tests, Cutters, *Electron (Beam cutting), Underground openings.

An electron-beam cutter offers the prospects of reduced costs and increased speed in tunneling and other hard-rock excavation operations. The present electron gun has a power of 10 kw, operates at 150 kv, and produces a focused electron beam having a power density of 1 million w/sq cm in the focal spot. The electron beam penetrates rock 0.01 cm deep. The kinetic energy of the electrons is dissipated almost instantly, giving an energy propagation much faster than could ever be accomplished by heat conduction. The rock surface layer melts in 15 micro-sec. The melt-front would propagate at a rate of 6.6 m/sec if the molten target material could be removed quickly. The molten material normally is unable to flow away fast enough, and is further heated by the electron beam and vaporized. Vapor pressure and vaporization rate increase exponentially with temperature, permitting rapid removal of material. Thermal effects can significantly augment melt cutting, producing sufficient stress to completely fragment the rock. Melt cutting and rock breaking tests in the laboratory are discussed. The energy efficiency of the electron beam method is very high, competitive with conventional methods, and far superior to some of the newer experimental methods. Equipment and maintenance costs are expected to be low. (USBR)

THE CLIMATE OF CITIES: A SURVEY OF RECENT LITERATURE,
National Air Pollution Control Administration, Raleigh, N.C.
James T. Peterson.
Nat Air Pollut Contr Admin Publication No AP-59, Oct 1969. 48 p, 7 fig, 6 tab, 127 ref.
Descriptors: *Climates, *Climatic data, *Cities, *Publications, Surveys, Climatic zones, Precipitation (Atmospheric), Humidity, Temperature, Radiation, Winds, Air pollution, Water vapor, Meteorological data.
Identifiers: *Urban climatology, *Urban-rural climates, Literature survey, Metropolitan studies.

City climate differs from the surrounding rural areas; increasing scientific research devoted to comparative studies of urban and rural climates point up this difference. This report reviews the literature on city climatology, particularly that written since a series of papers published by Dr. H. Landsberg (1956 to 1962). The Landsberg papers serve as a standard and provide the basis for this report on city-rural meteorological differences. Meteorological aspects discussed in the report include temperature, humidity, precipitation, radiation, wind, and visibility. (Lang-USGS)

W70-01029 05A

BACTERIAL AND PROTOZOAN INDICATORS OF WATER POLLUTION - STATISTICAL AND EXPERIMENTAL APPROACH,
W70-01036 05A

BIOLOGICAL TREATMENT
THE USE OF THE FUNDAMENTAL STUDIES OF BIOLOGICAL PURIFICATION ON THE PURIFICATION OF POLLUTED WATERS DERIVED FROM PRODUCTION OF 'KHEMLON' (SLOVAKIAN),
W70-00879 05D

BIOMASS
ESTIMATES OF PERIPHYTON MASS AND STREAM BOTTOM AREA USING PHOSPHOROUS-32,
W70-00846 02I

BIRDS
OIL POLLUTION OF THE SEA IS THE END IN SIGHT,
W70-01230 05C

BLUE GREEN ALGAE
A COMPOSITE RATING OF ALGAE TOLERATING ORGANIC POLLUTION,
W70-01233 05C

BOREHOLES
A LABORATORY INVESTIGATION OF BOREHOLE STABILITY,
W70-01107 08E

BOUNDARIES(PROPERTY)
BRIDGES - BOUNDARY AND OTHER WATERS.
W70-00951 06E

BRATSK DAM(USSR)
CRACKS IN BLOCKS OF THE BRATSK HYDROELECTRIC STATION DAM,
W70-01119 08F

BRIDGE CONSTRUCTION
BRIDGES - BOUNDARY AND OTHER WATERS.
W70-00951 06E

CONSTRUCTION, OPERATION, AND MAINTENANCE OF TOLL BRIDGES OVER PEARL RIVER.
W70-01152 06E

NEW JERSEY TURNPIKE AUTHORITY V SISSELMAN (CONDEMNATION OF RIPARIAN LAND).
W70-01155 06E

BRIDGE FAILURE
HIGHWAYS, FERRIES, WATERWAYS.
W70-00948 06E

BRIDGES
STATE HIGHWAYS.
W70-00888 04A

HIGHWAYS, FERRIES, WATERWAYS.
W70-00948 06E

BRIDGES - BOUNDARY AND OTHER WATERS.
W70-00951 06E

CONSTRUCTION, OPERATION, AND MAINTENANCE OF TOLL BRIDGES

OVER PEARL RIVER.
W70-01152 06E

BUILDING PLUMBING SEPARATION
REPORT ON PRESSURE SEWERAGE SYSTEM, SUMMER STREET SEPARATION STUDY AREA, BOSTON, MASSACHUSETTS,
W70-01051 08A

SEPARATION OF COMBINED WASTEWATER AND STORM DRAINAGE SYSTEMS, SAN FRANCISCO STUDY AREA.
W70-01053 08A

BUOYS
STAKES AND BUOYS.
W70-01185 06E

BURNING
INCREASES IN MAXIMUM STREAM TEMPERATURES AFTER SLASH BURNING IN A SMALL EXPERIMENTAL WATERSHED,
W70-01220 07C

BUTTERFLY VALVES
CONTROL TECHNIQUES FOR PRESSURIZED SEWERAGE SYSTEMS,
W70-01064 08C

CALCIUM CARBONATE
CALCIUM CARBONATE INTERACTION WITH ORGANIC COMPOUNDS,
W70-01069 02K

CALIFORNIA
FLOOD PLAIN INFORMATION, TROUT AND BIJOU CREEKS, SOUTH LAKE TAHOE, CALIFORNIA.
W70-00856 04A

GROUNDWATER IN SANTA BARBARA COUNTY, CALIFORNIA, SPRING 1967 TO SPRING 1968,

W70-01085 06A

DYNAMICS
THE DYNAMICS OF QUATERNARY SLOPE EVOLUTION AND ITS GEOMORPHOLOGICAL REPRESENTATION,
W70-01041 02J

EARTH DAMS
DETERMINING PORE PRESSURE IN SLIGHTLY PERMEABLE SOILS IN THE BODY OF A DAM DURING THE PROCESS OF THEIR CONSOLIDATION,
W70-01091 08D

EASEMENTS
NAVIGABLE WATERS--ARTIFICIAL LAKE CONNECTED TO RIVER,
W70-00937 04A

ECCENTRICITY
ANALYTICAL STUDIES OF TURBULENT FRICTION IN ANNULAR CONDUITS,
W70-01045 08B

ECOLOGY
THE INFLUENCE OF ALGAL ANTIBIOSIS ON THE ECOLOGY OF MARINE MICROORGANISMS,
W70-01068 05C

CHALLENGES TO CREATIVE CONSERVATION,
W70-01081 06G

THE ENVIRONMENT--AND WHAT TO DO ABOUT IT,
W70-01106 04D

ECONOMIC EFFICIENCY
COOLING TOWERS FOR STEAM-ELECTRIC STATIONS - ECONOMIC APPLICATIONS,
W70-00887 05D

ECONOMIC FEASIBILITY
STATUTORY STREAM POLLUTION CONTROL,
W70-00926 05G

ECONOMIC JUSTIFICATION
NON-MECHANICAL CONSIDERATIONS INVOLVED IN IMPLEMENTING PRESSURIZED SEWERAGE SYSTEMS,
W70-01065 08A

ECONOMICS
THE ECONOMICS OF ARIZONA'S WATER PROBLEM,
W70-01200 06D

PATTERNS OF WATER USE IN THE ARIZONA ECONOMY,
W70-01202 06D

THE DEVELOPMENT OF THE IRRIGATION ECONOMY OF MENDOZA, ARGENTINA,
W70-01213 03F

EFFECTS
WATER QUALITY CRITERIA FOR EUROPEAN FRESHWATER FISH - WATER TEMPERATURE AND INLAND FISHERIES.
W70-00880 05C

EGYPT
NEW WATER BIRD FOR EGYPT A ROBOT SHADOOF,
W70-01205 03F

ELASTICITY MODULUS
RELATION BETWEEN THE STATIC AND THE DYNAMIC DEFORMATION INDEXES OF ROCK IN LARGE-SCALE TESTS ON ROCK MASSES,
W70-01124 08E

ELECTRICAL DESIGN
ELECTRICAL DESIGN OF PARAMETERS USED FOR EHV SYSTEMS,
W70-01093 08C

ELECTRICAL RESISTANCE
THE RELATIONSHIP BETWEEN THE ULTIMATE RESISTIVITY OF CLAYEY SANDSTONES AND THEIR POROSITY AND CLAY CONTENTS (RUSSIAN),
W70-00876 07B

ELECTRICAL STABILITY
IMPROVED DIGITAL SIMULATION FOR ANALYZING POWER SYSTEM DISTURBANCES,
W70-01105 08C

ELECTRICAL STUDIES
ON THE POSSIBILITY OF ESTIMATING THE THICKNESS OF UNCONSOLIDATED ROCKS BY VERTICAL ELECTRICAL SOUNDING IN PERMAFROST AREAS (RUSSIAN),
W70-00878 07B

THE WATER-TABLE AQUIFER IN THE EASTERN COASTAL AREA OF BELGIUM,
W70-00986 02F

IMPROVED DIGITAL SIMULATION FOR ANALYZING POWER SYSTEM DISTURBANCES,
W70-01105 08C

ELECTRODES(SELECTIVE ION)
USE OF A SELECTIVE ION ELECTRODE FOR DETERMINATION OF NITRATE IN SOILS,
W70-01075 05A

ELECTRON BEAMS
ELECTRON BEAMS APPLY AN OLD PRINCIPLE TO MODERN ROCK-BREAKING,
W70-01109 08H

ELECTRON(BEAM CUTTING)
ELECTRON BEAMS APPLY AN OLD PRINCIPLE TO MODERN ROCK-BREAKING,
W70-01109 08H

EMBANKMENTS
A SEMI-EMPIRICAL METHOD FOR DETERMINING STRESSES BENEATH EMBANKMENTS,
W70-01102 08D

EMINENT DOMAIN
FLOOD CONTROL - DRAINAGE DISTRICTS.
W70-00954 04A

RIGHT OF EMINENT DOMAIN OF PUBLIC SERVICE CORPORATIONS.
W70-01176 06E

ENERGY LOSSES
HEAD LOSSES CAUSED BY AN ICE COVER ON OPEN CHANNELS,
W70-01126 08B

ENGINEERING GEOLOGY
CERTAIN ASPECTS OF ENGINEERING GEOLOGY IN PERMAFROST,
W70-01011 08D

ENVIRONMENT
THE ENVIRONMENT--AND WHAT TO DO ABOUT IT,
W70-01106 04D

EQUATIONS
MODIFIED RUBEY'S LAW ACCURATELY PREDICTS SEDIMENT SETTLING VELOCITIES,
W70-00855 02J

EROSION
THE DYNAMICS OF QUATERNARY SLOPE EVOLUTION AND ITS GEOMORPHOLOGICAL REPRESENTATION,
W70-01041 02J

PLEISTOCENE ACTIVITY AND HOLOCENE STABILITY OF HILLSLOPES, WITH EXAMPLES FROM SCANDINAVIA AND PENNSYLVANIA,
W70-01042 02J

EROSIONS
SHEETFLOODS, STREAMFLOODS, AND THE FORMATION OF PEDIMENTS,
W70-01211 02J

ESTUARINE ENVIRONMENT
MATHEMATICAL SIMULATION OF THE ESTUARINE BEHAVIOR AND ITS APPLICATIONS,
W70-00896 05C

EUGLENA
A COMPOSITE RATING OF ALGAE TOLERATING ORGANIC POLLUTION,
W70-01233 05C

EUTROPHICATION
STRONTIUM-90 CONCENTRATION FACTORS OF LAKE PLANKTON, MACROPHYTES, AND SUBSTRATES,
W70-01010 05C

STUDIES ON NATURAL FACTORS AFFECTING PHOSPHATE ABSORPTION AND ITS UTILIZATION BY ALGAE,
W70-01031 05C

CAUSES AND CONSEQUENCES OF POND EUTROPHICATION (POLISH),
W70-01082 05F

EVALUATION
FIELD EVALUATION OF SEEPAGE MEASUREMENT METHODS,
W70-01236 04A

EVAPORATION
A NUMERIC METHOD FOR ESTIMATING INFILTRATION, REDISTRIBUTION, DRAINAGE, AND EVAPORATION OF WATER FROM SOIL,
W70-00862 02G

AN EMPIRICAL METHOD FOR ESTIMATING MONTHLY POTENTIAL EVAPOTRANSPIRATION IN NEVADA,
W70-01004 02D

EXCAVATION
GROUNDWATER MOVEMENT TOWARD ARTIFICIAL CUTS,
W70-00858 02F

EXPANSION
A LABORATORY INVESTIGATION OF BOREHOLE STABILITY,
W70-01107 08E

EXPANSIVE CLAYS
HYDROSTATICS AND HYDRODYNAMICS IN SWELLING SOILS,
W70-00841 02G

CONTROLLING THE EXPANSION OF DESICCATED CLAYS DURING CONSTRUCTION,

HYDRAULICS OF A PRESSURIZED SEWERAGE SYSTEM AND USE OF

CENTRIFUGAL PUMPS,
W70-01059 08C

PYROLITIC GAS CHROMATOGRAPHY
APPLICATION OF PYROLYTIC GAS CHROMATOGRAPHY TO NATURAL WATERS,
W70-00847 05A

QUATERNARY PERIOD
THE DYNAMICS OF QUATERNARY SLOPE EVOLUTION AND ITS GEOMORPHOLOGICAL REPRESENTATION,
W70-01041 02J

RADAR
MULTISENSOR ANALYSIS FOR SOILS MAPPING,
W70-01125 07B

RADAR IMAGES
MULTISENSOR ANALYSIS FOR SOILS MAPPING,
W70-01125 07B

RADIOACTIVE TRACERS
THE RELATION OF ION MOVEMENT TO FINE PARTICLE DISPLACEMENT IN A SAND BED,
W70-00909 05B

RADIOTRACER STUDY OF RAPID SAND FILTRATION,
W70-00910 05D

RADIUS RATIO
ANALYTICAL STUDIES OF TURBULENT FRICTION IN ANNULAR CONDUITS,
W70-01045 08B

RAIN GAGES
MEASURING RAINFALL ON FOREST CATCHMENTS,
W70-00843 02B

SEASONAL VARIATION IN RAIN GAGE CATCH,
W70-00854 02B

RAINBOW TROUT
THE DIURETIC RESPONSE BY RAINBOW TROUT TO SUB-LETHAL CONCENTRATIONS OF AMMONIA,
W70-00848 05C

RAINFALL
MEASURING RAINFALL ON FOREST CATCHMENTS,
W70-00843 02B

ESTIMATION OF GRAZING CAPACITY ON ARID GRAZING LANDS,
W70-01206 03F

RAINFALL DISPOSITION
A LABORATORY STUDY OF SURFACE RUNOFF DUE TO MOVING RAINSTORMS,
W70-00839 02A

RAINFALL ROUTING
A MODEL FOR RAINFALL ROUTING DURING INITIAL ABSTRACTION,
W70-00844 02A

RAINFALL VARIABILITY
EFFECT OF RAINFALL VARIABILITY ON STREAMFLOW SIMULATION,
W70-00850 02A

RAINFALL-RUNOFF RELATIONSHIPS
A LABORATORY STUDY OF SURFACE RUNOFF DUE TO MOVING RAINSTORMS,
W70-00839 02A

A MODEL FOR RAINFALL ROUTING DURING INITIAL ABSTRACTION,
W70-00844 02A

EFFECT OF RAINFALL VARIABILITY ON STREAMFLOW SIMULATION,
W70-00850 02A

CONTINUOUS HYDROGRAPH SYNTHESIS WITH AN API-TYPE HYDROLOGIC MODEL,
W70-00860 02A

A WATER YIELD MODEL DERIVED FROM MONTHLY RUNOFF DATA,
W70-00905 03B

RANGE MANAGEMENT
DIGITIZED PHYSICAL DATA OF A RANGELAND WATERSHED,
W70-00993 07C

RAPID SAND FILTRATION
RADIOTRACER STUDY OF RAPID SAND FILTRATION,
W70-00910 05D

REAERATION
STREAM REAERATION USING MOLECULAR OXYGEN,
W70-01028 05G

REASONABLE USE
PRIVATE WATER RIGHTS IN FRANCE AND IN THE EASTERN UNITED STATES,
W70-00916 06B

W70-00918 06B

NOTES ON WATER WORKS LAW SECOND INSTALLMENT - IRRIGATION AND RIPARIAN RIGHTS,

SLURRIES
EXPERIMENTAL STUDY OF SLURRY SEPARATORS FOR USE IN DESALINATION,
W70-00892 03A

SNOW
WASTEWATER DISPOSAL AND MICROBIAL ACTIVITY AT ICE-CAP FACILITIES,
W70-00882 05C

STRENGTH TEST ON NEWLY FALLEN SNOW,
W70-01221 07B

SNOW COVER
STRENGTH TEST ON NEWLY FALLEN SNOW,
W70-01221 07B

SNOWPACKS
STRENGTH TEST ON NEWLY FALLEN SNOW,
W70-01221 07B

SOCKEYE SALMON
IMPLICATION OF WATER QUALITY AND SALINITY IN THE SURVIVAL OF FRASER RIVER SOCKEYE SMOLTS,
W70-01225 05C

SOIL ANALYSIS
USE OF A SELECTIVE ION ELECTRODE FOR DETERMINATION OF NITRATE IN SOILS,
W70-01075 05A

SOIL CLASSIFICATIONS
MULTISENSOR ANALYSIS FOR SOILS MAPPING,
W70-01125 07B

SOIL ENGINEERING
MULTISENSOR ANALYSIS FOR SOILS MAPPING,
W70-01125 07B

SOIL EROSION
SOIL MOVEMENT ON IRREGULAR SLOPES,
W70-00864 02J

SOIL MAPS
MULTISENSOR ANALYSIS FOR SOILS MAPPING,
W70-01125 07B

SOIL MECHANICS
ADVANTAGES AND LIMITATIONS OF THE OBSERVATIONAL METHOD IN APPLIED SOIL MECHANICS,
W70-01092 08D

SOIL MOISTURE METER
TEMPORAL, HORIZONTAL AND VERTICAL VARIABILITY OF WATER CHEMISTRY IN UNSATURATED ZONE OF FINE-GRAINED SOILS,
W70-00911 05B

SOIL WATER MOVEMENT
STEADY FLOW OF WATER THROUGH A TWO-LAYER SOIL,
W70-00840 02G

HYDROSTATICS AND HYDRODYNAMICS IN SWELLING SOILS,
W70-00841 02G

A NUMERIC METHOD FOR ESTIMATING INFILTRATION, REDISTRIBUTION, DRAINAGE, AND EVAPORATION OF WATER FROM SOIL,
W70-00862 02G

SOILS
PERSISTENCE OF DIAZINON AND ZINOPHOS IN SOIL EFFECTS OF AUTOCLAVING, TEMPERATURE, MOISTURE, AND ACIDITY,
W70-01079 02K

SOIL-WATER-PLANT RELATIONSHIPS
EFFECTS OF EXTERNAL SALT CONCENTRATIONS ON WATER RELATIONS IN PLANTS SIGNIFICANCE OF EXTERNAL WATER-POTENTIAL AND SALT-TRANSPORT KINETICS ON RATE OF CELL EXPANSION,
W70-01214 02I

SOLAR RADIATION
NET RADIATION IN A RIPARIAN MESQUITE COMMUNITY,
W70-00853 02I

THE THERMAL CLIMATE OF CITIES,
W70-01241 05B

SOLIFLUCTION
PLEISTOCENE ACTIVITY AND HOLOCENE STABILITY OF HILLSLOPES, WITH EXAMPLES FROM SCANDINAVIA AND PENNSYLVANIA,
W70-01042 02J

SOUTH AUSTRALIA
WATER SUPPLIES IN SOUTH AUSTRALIA,
W70-01204 03B

SOUTH CAROLINA
DAMS.
W70-00891 04A

SPAWNING
FISH (SEASONS, LIMITS, SPAWNING GROUNDS).
W70-00944 06E

SPECIAL TOOLS
FINAL REPORT TO THE AMERICAN SOCIETY OF CIVIL ENGINEERS ON TASK 7 AND TASK 9 OF THE COMBINED SEWER SEPARATION PROJECT,
W70-01043 08A

SPECIFIC RETENTION
WATER-RETENTION CHARACTERISTICS OF COARSE ROCK PARTICLES,
W70-00997 02G

SPECIFICATIONS
FINAL REPORT TO THE AMERICAN SOCIETY OF CIVIL ENGINEERS ON TASK 7 AND TASK 9 OF THE COMBINED SEWER SEPARATION PROJECT,
W70-01043 08A

SPILLWAYS
EXPERIMENTAL RESEARCH ON SPILLWAY SHAFT FLOW (FRENCH),
W70-00873 08B

SPILLWAY FOR BEND LAKE RESERVOIR, BIG MUDDY RIVER, ILLINOIS HYDRAULIC MODEL INVESTIGATION,
W70-01223 08B

SPORT FISHING
FISHING IN INTERSTATE NONTIDAL WATERS.
W70-01020 06E

SPRINGS
RECORDS OF SELECTED WELLS AND SPRINGS IN THE BULISON PROJECT AREA, GARFIELD AND MESA COUNTIES, COLORADO,
W70-00987 07C

SPRINKLER IRRIGATION
COMMUNITY IRRIGATION PROJECTS IN THE WAIKERIE DISTRICT OF SOUTH AUSTRALIA,
W70-01207 03F

STANDARDS
WATER QUALITY CRITERIA FOR EUROPEAN FRESHWATER FISH - WATER TEMPERATURE AND INLAND FISHERIES.
W70-00880 05C

STATISTICAL METHODS
EFFECT OF RAINFALL VARIABILITY ON STREAMFLOW SIMULATION,
W70-00850 02A

STATISTICAL MODELS
FREQUENCY DISTRIBUTIONS OF STREAM LINK LENGTHS,
W70-01006 02J

STEADY FLOW
STEADY FLOW OF WATER THROUGH A TWO-LAYER SOIL,
W70-00840 02G

GROUNDWATER MOVEMENT TOWARD ARTIFICIAL CUTS,
W70-00858 02F

STEAM
COOLING TOWERS FOR STEAM-ELECTRIC STATIONS - ECONOMIC APPLICATIONS,
W70-00887 05D

STEREOSCOPIC
PHOTOGRAMMETRIC MEASUREMENT OF ROCK SURFACES IN A POWER TUNNEL,
W70-01090 07B

STILLING BASINS
CONVERGENT STILLING BASINS,
W70-01099 08B

STOCHASTIC PROCESSES
A STOCHASTIC APPROACH TO THE DEVELOPMENT OF A REGULATION PLAN FOR THE GREAT LAKES,
W70-00902 02H

STOCHASTIC METHODS FOR ANALYZING RIVER BASIN SYSTEMS,
W70-01085 06A

STORAGE CAPACITY
CATAD SYSTEM CONTROLS FOR REGULATION OF COMBINED SEWAGE FLOWS,
W70-00889 05D

STORAGE COEFFICIENT
SUBSURFACE FLOW REGIMES OF A HYDROLOGIC WATERSHED MODEL,
W70-01237 02F

STORM RUNOFF
CATAD SYSTEM CONTROLS FOR REGULATION OF COMBINED SEWAGE FLOWS,
W70-00889 05D

STORMS
NATURAL FEATURES CAUSED BY A CATASTROPHIC STORM IN NELSON AND AMHERST COUNTIES, VIRGINIA,.
W70-00992 02E

STRATIFICATION
NEW THERMAL INVESTIGATION OF LAKES TRAUNSEE AND FUSCHLSEE (IN GERMAN),
W70-00886 02H

STREAM REAERATION
STREAM REAERATION USING MOLECULAR OXYGEN,
W70-01028 05G

STREAMBEDS
SALVAGE.
W70-00947 06E

STREAMFLOW
A WATER YIELD MODEL DERIVED FROM MONTHLY RUNOFF DATA,
W70-00905 03B

EFFECT OF CHANGES OF STREAMFLOW REGIMEN ON RESERVOIR YIELD,
W70-01001 04A

MEASUREMENT OF COLUMBIA RIVER FLOW TIME FROM HANFORD REACTORS TO ASTORIA, OREGON-SUMMER 1966,
W70-01002 02E

STREAMFLOW FORECASTING
CONTINUOUS HYDROGRAPH SYNTHESIS WITH AN API-TYPE HYDROLOGIC MODEL,
W70-00860 02A

STREAMS
FREQUENCY DISTRIBUTIONS OF STREAM LINK LENGTHS,
W70-01006 02J

STREAM REAERATION USING MOLECULAR OXYGEN,
W70-01028 05G

STRESS
A SEMI-EMPIRICAL METHOD FOR DETERMINING STRESSES BENEATH EMBANKMENTS,
W70-01102 08D

STRESS ANALYSIS
A SEMI-EMPIRICAL METHOD FOR DETERMINING STRESSES BENEATH EMBANKMENTS,
W70-01102 08D

STRONTIUM RADIOISOTOPES
STRONTIUM-90 CONCENTRATION FACTORS OF LAKE PLANKTON, MACROPHYTES, AND SUBSTRATES,
W70-01010 05C

SUBMERGED LAND GRANTS
REAL PROPERTY--RIPARIAN GRANTS--LEGISLATIVE LIMITATIONS ON EXTENT OF GRANT.
W70-00927 06B

SUBSIDENCE
LAND SUBSIDENCE DUE TO GROUND-WATER WITHDRAWAL, TULARE-WASCO AREA, CALIFORNIA,
W70-01013 02F

SUBSIDENCE(ATMOSPHERIC)
WEATHER PATTERNS IN SOUTHERN WEST PAKISTAN,
W70-01197 02B

SUBSURFACE FLOW
SUBSURFACE FLOW REGIMES OF A HYDROLOGIC WATERSHED MODEL,
W70-01237 02F

SUBSURFACE INVESTIGATIONS
SURFACE AND SUBSURFACE EXPLORATION BY INFRARED SURVEYS,
W70-01128 07B

SUDAN
THE DEVELOPMENT AND DISTRIBUTION OF PLANKTON IN THE NORTHERN PART OF THE WHITE NILE,
W70-01007 02I

THE LAND AND WATER USE SURVEY OF NORTH-CENTRAL KORDOFAN (1961-66),
W70-01198 03B

THE KHASHM EL GIRBA IRRIGATION SCHEME A NEW SOCIO-ECONOMIC PROJECT IN THE SUDAN,
W70-01208 03F

SUPERCRITICAL FLOW
NON-LINEAR FREE SURFACES IN OPEN CHANNELS (FRENCH),
W70-00871 08B

SUPERVISORY CONTROL(POWER)
DUTIES OF DIRECTOR OF PUBLIC WORKS.
W70-01182 04A

SURFACE RUNOFF
CALCULATION OF WATER POLLUTION BY SURFACE RUNOFF,
W70-01026 05B

STOUDER V DASHNER (DOMINANT VERSUS SERVIENT LAND RIGHTS RELATING TO DRAINAGE OF SURFACE WATERS).
W70-01146 04A

SURFACE RUNOFF AND FLOODWATER DIVERSION.
W70-01177 04A

SURFACE WATERS
PRIVATE WATER RIGHTS IN FRANCE AND IN THE EASTERN UNITED STATES,
W70-00919 06B

BASIC WATER USE DOCTRINES AND STATE WATER CONTROL AGENCIES.
W70-01131 04A

SURFACE-GROUNDWATER RELATIONSHIPS
A CONJUNCTIVE OPERATION OF A SURFACE RESERVOIR AND A GROUNDWATER AQUIFER,
W70-00906 02A

SURVEYING
PHOTOGRAMMETRIC MEASUREMENT OF ROCK SURFACES IN A POWER TUNNEL,
W70-01090 07B

SURVEYS
ON A SOIL AND GROUND WATER INVESTIGATION WITH THE SHALLOW REFRACTION METHOD AT MO I RANA,
W70-00995 07B

SURVEYS OF AND RIGHTS IN OYSTER GROUNDS.
W70-01163 03E

THE LAND AND WATER USE SURVEY OF NORTH-CENTRAL KORDOFAN (1961-66),
W70-01198 03B

SUSPENDED LOAD
THE INFLUENCE OF SUSPENDED SOLIDS ON THE RATE OF OXYGEN TRANSFER IN AQUEOUS SOLUTIONS,
W70-01023 05D

SWAMPS
SWAMP LAND DISTRICTS.
W70-00953 04A

SWEDEN
GLACIAL HISTORY AND MORPHOLOGY OF WEST SWEDEN (SWEDISH),
W70-00998 02C

SWITZERLAND
DIAGENETIC CHANGES IN INTERSTITIAL WATERS OF HOLOCENE LAKE CONSTANCE SEDIMENTS,
W70-01009 02H

SYNTHESIZED PEAK DISCHARGES
PEAK FLOWS OF SEWAGE FROM INDIVIDUAL HOUSES,
W70-01062 08B

SYNTHETIC HYDROLOGY
SIMULATION OF RUNOFF FOR DESIGN OF WATER RESOURCE SYSTEMS,
W70-00900 04A

SYSTEMS ANALYSIS
A SYSTEMS APPROACH TO WASTE MANAGEMENT,
W70-00898 05D

GENERAL SYSTEMS APPROACH TO GROUND-WATER PROBLEMS,
W70-01123 02F

TARIM BASIN
REGIONAL AND SEASONAL WATER SUPPLY IN THE TARIM BASIN AND ITS RELATION TO CULTIVATED LAND POTENTIALS,
W70-01210 03F

TAX RATE

PAT HARRISON WATERWAY DISTRICT.
W70-00960 05G

TAXES
OYSTER RECORDS AND TAXES.
W70-00979 06E

RHODE ISLAND WATER RESOURCES BOARD.
W70-01100 06D

TEMPERATURE
WATER QUALITY CRITERIA FOR EUROPEAN FRESHWATER FISH - WATER TEMPERATURE AND INLAND FISHERIES.
W70-00880 05C

INCREASES IN MAXIMUM STREAM TEMPERATURES AFTER SLASH BURNING IN A SMALL EXPERIMENTAL WATERSHED,
W70-01220 07C

CITY AIR - BETTER OR WORSE,
W70-01239 05B

SOME OBSERVATIONS OF CLOUD INITIATION IN INDUSTRIAL AREAS,
W70-01240 05C

TEMPERATURE ACCLIMATIZATION
WATER QUALITY CRITERIA FOR EUROPEAN FRESHWATER FISH REPORT ON WATER TEMPERATURE AND INLAND FISHERIES BASED MAINLY ON SLAVONIC LITERATURE.
W70-01228 05C

TEMPERATURE CONTROL
THE OPTIMUM TEMPERATURE FOR THE OPERATION OF A NON-SCALING MULTI-STAGE FLASH EVAPORATOR PLANT,
W70-00907 03A

TEMPERATURE EFFECTS
WATER QUALITY CRITERIA FOR EUROPEAN FRESHWATER FISH LIST OF LITERATURE ON THE EFFECT OF WATER TEMPERATURE ON FISH.
W70-01227 05C

TEMPERATURE RANGE
WATER QUALITY CRITERIA FOR EUROPEAN FRESHWATER FISH REPORT ON WATER TEMPERATURE AND INLAND FISHERIES BASED MAINLY ON SLAVONIC LITERATURE.
W70-01228 05C

TEMPERATURE REQUIREMENTS
WATER QUALITY CRITERIA FOR EUROPEAN FRESHWATER FISH LIST OF LITERATURE ON THE EFFECT OF WATER TEMPERATURE ON FISH.
W70-01227 05C

TERRAIN ANALYSIS
THE ANALYSIS AND CLASSIFICATION OF SLOPE PROFILE FORMS,
W70-01040 02J

TERTIARY TREATMENT
EFFECT OF POLYELECTROLYTES IN CONJUNCTION WITH BENTONITIC CLAY ON CONTAMINANTS REMOVAL FROM SECONDARY EFFLUENTS,
W70-00845 05D

TEST RESULTS
FIELD TEST RESULTS ON 113,000 KW FRANCIS PUMP-TURBINES FOR NAGANO POWER STATION,
W70-01097 08C

THEORETICAL MOMENTS
ROUTING OF FLOWS IN SANITARY SEWERAGE SYSTEMS,
W70-01067 08A

THERMAL DEGRADATION
WASTEWATER DISPOSAL AND MICROBIAL ACTIVITY AT ICE-CAP FACILITIES,
W70-00882 05C

THERMAL EFFECTS
PERSISTENCE OF DIAZINON AND ZINOPHOS IN SOIL EFFECTS OF AUTOCLAVING, TEMPERATURE, MOISTURE, AND ACIDITY,
W70-01079 02K

THERMAL POLLUTION
NUCLEAR POWER PLANT SITING IN THE PACIFIC NORTHWEST FOR THE BONNEVILLE POWER ADMINISTRATION,
W70-00883 05D

COPING WITH COOLING TOWER BLOWDOWN,
W70-00884 05D

THE USE OF A DIGITAL SIMULATION SYSTEM FOR THE MODELING AND PREDICTION OF WATER QUALITY,
W70-01030 05A

WATER QUALITY CRITERIA FOR EUROPEAN FRESHWATER FISH LIST OF LITERATURE ON THE EFFECT OF WATER TEMPERATURE ON FISH.
W70-01227 05C

THERMAL PROPERTIES
NEW THERMAL INVESTIGATION OF LAKES TRAUNSEE AND FUSCHLSEE (IN GERMAN),
W70-00986 02H

THERMAL STRATIFICATION
CAUSES AND CONSEQUENCES OF POND EUTROPHICATION (POLISH),
W70-01082 05F

THERMAL WATER
A SCHEME OF GEOTHERMAL WATERS OF CENTRAL ASIA (RUSSIAN),
W70-00869 02F

THIOMETON
FISHERY MANAGEMENT WITH THE HELP OF THE ORGANOPHOSPHORUS INSECTICIDE, THIOMETON,
W70-01232 05C

TIDAL EFFECTS
DETERMINING AQUIFER CHARACTERISTICS BY THE TIDAL METHOD,
W70-00859 02F

TIDAL WATERS
REAL PROPERTY--RIPARIAN GRANTS--LEGISLATIVE LIMITATIONS ON EXTENT OF GRANT.
W70-00927 06B

TISZA RIVER(HUNGARY)
APPROACH TO DETERMINE THE MINIMUM ALLOWABLE FLOW IN THE TISZA RIVER, HUNGARY,
W70-01035 05G

TOMBIGBEE RIVER
TOMBIGBEE RIVER VALLEY WATER MANAGEMENT DISTRICT.
W70-00957 04A

TOPOGRAPHY
FREQUENCY DISTRIBUTIONS OF STREAM LINK LENGTHS,
W70-01006 02J

THE LAKE MISSOULA FLOODS AND THE CHANNELED SCABLAND,
W70-01012 02J

TOXICITY
THE DIURETIC RESPONSE BY RAINBOW TROUT TO SUB-LETHAL CONCENTRATIONS OF AMMONIA,
W70-00848 05C

A RAPID FOR MEASURING THE ACUTE TOXICITY OF DISSOLVED MATERIALS TO MARINE FISHES,
W70-00849 05A

TRACE ELEMENTS
DISTINGUISHING MARINE AND FRESHWATER MUDS,
W70-00994 02K

TRACERS
FLUORESCENT SAND AS A TRACER OF FLUVIAL SEDIMENT,
W70-00867 02J

MEASUREMENT OF COLUMBIA RIVER FLOW TIME FROM HANFORD REACTORS TO ASTORIA, OREGON-SUMMER 1966,
W70-01002 02E

THE USE OF A DIGITAL SIMULATION SYSTEM FOR THE MODELING AND PREDICTION OF WATER QUALITY,
W70-01030 05A

THE PREDICTION OF THE DISTRIBUTION OF DISSOLVED OXYGEN IN RIVERS,
W70-01033 05B

TRACKING TECHNIQUES
MOVEMENT OF DDT AND NITRATES DURING GROUND-WATER RECHARGE,
W70-00861 05B

MEASUREMENT OF COLUMBIA RIVER FLOW TIME FROM HANFORD REACTORS TO ASTORIA, OREGON-SUMMER 1966,
W70-01002 02E

TRANSMISSION LINES
ELECTRICAL DESIGN OF PARAMETERS USED FOR EHV SYSTEMS,
W70-01093 08C

TRANSMISSIVITY
DETERMINING AQUIFER CHARACTERISTICS BY THE TIDAL METHOD,
W70-00859 02F

TRANSPORT VELOCITY
MINIMUM TRANSPORT VELOCITY FOR PRESSURIZED SANITARY SEWERS,
W70-01060 08B

TUNNEL DESIGN
HYDRAULIC DESIGN OF UNLINED ROCK TUNNELS,
W70-01114 08E

TUNNEL HYDRAULICS
PHOTOGRAMMETRIC MEASUREMENT OF ROCK SURFACES IN A POWER TUNNEL,
W70-01090 07B

HYDRAULIC DESIGN OF UNLINED ROCK TUNNELS,
W70-01114 08E

HYDRAULIC PROPERTIES OF SMALL UNLINED ROCK TUNNELS,
W70-01115 08B

TUNNELS
PHOTOGRAMMETRIC MEASUREMENT OF ROCK SURFACES IN A POWER TUNNEL,

SELECTED WATER RESOURCES ABSTRACTS

UNIVERSITY OF ILLINOIS
MAR - 5 1970
LIBRARY

VOLUME 3, NUMBER 4
FEBRUARY 15, 1970

W70-01242 -- W70-01641

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 3, NUMBER 4
FEBRUARY 15, 1970

W70-01242 -- W70-01641

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

THERMAL NEUTRON SCATTERING MEASUREMENTS IN WATER,
Gulf General Atomic, Inc., San Diego, Calif.
G. M. Borgonovi, J. U. Koppel, and J. A. Young.
Office Saline Water Res and Develop Progr Rep No 449, May 1969. 59 p, 20 fig, 45 ref. Available from the Superintendent of Documents, U S Gov't Printing Office, Washington D C, 20402, for $0.65 per copy. OSW Contract No 14-01-0001-1705.

Descriptors: *Water properties, *Analytical techniques, *Neutron absorption, Ice, Water, Elastic theory, Energy transfer, Momentum equation.
Identifiers: *Neutron scattering, Thermal neutrons.

The status, quantity, and usefulness of presently available inelastic neutron scattering measurements in water have been reviewed. On the basis of this review, it has been found that good knowledge of the neutron scattering from water exists only within a limited range of the variables energy and momentum exchanges. A number of suggestions are given for the best experimental and theoretical approach for studying water by means of inelastic slow-neutron scattering. The suggestions include the analysis of the distributions of scattered neutrons instead of the scattering law for some ranges of energy and momentum transfer and the calculation of the cross section with a method that does not require unnecessary approximations. A detailed theoretical analysis of the dynamics of water has been performed for the diffusive and vibrational modes. That part of the dynamics which pertains to the rotational modes has been correlated to the slow-neutron scattering results and a best estimate for the rotational part of the frequency spectrum has been obtained. PROPERTIES OF WATER AND AQUEOUS SOLUTIONS AT HIGH PRESSURES AND TEMPERATURES,
Pennsylvania State Univ., University Park.
C. Wayne Burnham, and H. L. Barnes.
Office Saline Water Res and Develop Progr Rep No 383, 1968. 52 p, 9 fig, 10 ref, 1 append. Available from the Superintendent of Documents, US Gov't Printing Office, Washington, DC. 20402 for $0.60 per copy. Grant No 14-01-0001-408 (OSW); G 19190 (NSF).

Descriptors: *Water properties, *Aqueous solutions, Pressure, Temperature, Specific weight, Equations, Volume, Argon, Statistical methods.
Identifiers: *Specific volume (Water), International Skeleton Tables.

The specific volume of water in the temperature range 20 deg - 925 deg C, at pressures up to 8,500 bars has been determined. More than 1,000 of such determinations were made in two interconnected argon-pressurized vessels, one of which was equipped with an internal heater. The raw data, in terms of specific volume as a function of pressure and temperature, were fitted throughout most of the P-T region by a ninth degree polynomial in PV as a function of T and P. The data in the low pressure-high temperature region were fitted better by an eighth degree polynomial in PV as a function of T and 1/P. The overall fit of these equations, which were used to generate tables of specific volume on orthogonal coordinates from 1,000 to 8,900 bars and from 20 deg to 900 deg C, is within 0.1% (one standard deviation). Comparisons reveal very good agreement with the work of Bridgman at high pressures and low temperatures and with the International Skeleton Tables at 1,000 bars and high temperatures. (Carstea-USGS)

NONLINEAR PROBLEMS OF COMPRESSIBLE FLOW,
Akademiya Nauk Armyanskoi SSR, Erevan. Institut Matematiki i Mekhaniki.
A. G. Bagdoev.
Jerusalem. Israel Program for Scientific Translations, 1969. 168 p, 19 fig, 1 tab, 65 ref. Clearinghouse TT 69-55023. Translation of Nekotorye Nelineinye Zadachi o Dvizhenii Szhimaemoi Zhidkosti. Erevan 1967. NASA TTF-560.

Descriptors: *Fluid mechanics, *Flow characteristics, *Waves (Water), *Compressible flow, *Mathematical studies, Flow rates, Dimensional analysis, Pressure, Sound waves, Boundaries (Surfaces), Conductivity, Viscous flow.
Identifiers: USSR, Shock wave hydrodynamics.

This monograph is an analytical study of the motion of a half-space of ideal compressible fluid stimulated by an arbitrary pressure front moving over its surface. Physically such a situation takes place in an explosion on or above the surface of a fluid. It is assumed that the pressure in the air may be considered as in the reflection of a shock wave from a rigid wall. The problem is formulated nonlinearly for the pressure, and an isentropic approximation is used. The linear theory can be greatly improved by using only the linear solution. The monograph contains discussions of the fluid pressure with a wave front moving with constant velocity over the surface, and of the pressure distribution for arbitrary conditions at the boundary of a half-space. OBSERVATIONS OF NOCTILUCENT CLOUDS.
Vsesoyuznoe Astronomo-Geodezicheskoe Obshchestvo, Moscow (USSR).

Translation of Nablyudeniya serebristykh oblakov, Moscow, Nauka, 1967. NASA Tech Transl No 546, Apr 1969. 153 p, 29 fig, 24 tab, 257 ref.

Descriptors: *Clouds, *Cloud physics, *Water circulation, *Atmospheric physics, *Atmosphere, Ice, Winds, Temperature, Sun, Radiation, Instrumentation, Photometers, Light intensity, Altitude, Statistical methods.
Identifiers: *USSR, Noctilucent clouds.

This monograph on the observations and analytical studies of the noctilucent clouds consists of 14 articles by several USSR investigators. These articles examine the nature and the results of observations of noctilucent clouds floating at the 80-km altitude, wave movements in noctilucent clouds, methods for determining the cloud positions in a projection on the earth's surface, and calculations of the cloud coordinates using electronic computers. Some articles are devoted to linking the appearances of noctilucent clouds with atmospheric currents on the earth and with sunspot activity. (Gabriel-USGS)

STRUCTURE OF 'POLYWATER',
Pennsylvania Univ., Philadelphia. Dept. of Chemistry; and Pennsylvania Univ., Philadelphia. Lab. for Research on the Structure of Matter.
Jerry Donohue.
Science, Vol 166, No 3908, p 1000-1001, Nov 21, 1969. 2 p, 2 fig.

Descriptors: *Water structure, *Water properties, *Hydrogen bonding, *Structural models, Viscosity, Density, Molecular structure, X-ray analysis, Theoretical analysis.
Identifiers: *Polywater.

A proposed structure for 'polywater' consists of hydrogen-bonded clusters of water molecules lying at the vertices of rhombic dodecahedra. In this model, all O-O bond angles can be very near to the 109 deg 28 min value observed in 8 forms of ice and in numerous hydrates. (Knapp-USGS)
W70-01443

THERMODYNAMIC PROPERTIES OF SEAWATER AND ITS CONCENTRATES,
Monsanto Research Corp., Everett, Mass.
B. M. Fabuss, and A. Korosi.
Desalination 2, 271-78, 1967. 4 fig, 3 ref. Presented at 2nd European Symp Fresh Water from Sea, Vol 2, Athens, May 1967. OSW sponsored.
Identifiers: *Physical properties, *Thermodynamics, Viscosity.

Densities, vapor pressures, and viscosities of binary and ternary solutions were measured at concentrations corresponding to that of seawater and its concentrates up to a fivefold concentration over a 25 to 175 deg C temperature range. The method of investigation was to measure property values on binary solutions containing single salts, and then on ternary solutions. With correlations that were developed, the investigation was extended to multicomponent electrolyte systems. It is believed that density values of similar systems can be estimated with good reliability using this method. The superposition of an Othmer plot of the density of seawater on log-log scale vs density of water, on a plot of salt solution densities, shows that there is excellant agreement between experimental and theoretical data.
W70-01566

SOME PHYSICAL PROPERTIES OF SEA WATER IN VARIOUS CONCENTRATIONS,
National Engineering Laboratory, East Kilbride (Scotland).
W. H. Emerson, and D. T. Jamieson.
Desalination 3, 213-224, 1967, 6 fig, 7 ref. Presented at 2nd European Symp Fresh Water From Sea, Vol 2, Athens, May 1967.
Identifiers: *Physical properties, Experimental data, Research results, Thermal properties.

The vapor pressure of seawater and its concentrates has been measured in the temperature range 100 deg C to 180 deg C using a single isoteniscope, and the thermal conductivity has been determined in the range of zero to 75 deg C by a hot-wire comparative method. Most of the measurements were made with synthetic seawater containing no calcium sulphate, though some results obtained with natural seawater are also given. Concentrations up to five times that of natural seawater were studied. The measured values of vapor pressure have been fitted by an equation which assumes that for a given composition of salts the activity is a pure function of the total ionic strength. This yields a standard deviation as good as that obtained with measurements on distilled water and the NEL steam tables. The smoothed values of thermal conductivity are believed to be accurate to plus or minus 3%. A rise in salinity with increasing temperature is a consequence of migration of water from the liquid to the vapor phase.
W70-01568

PROPERTIES OF SEA WATERS AND ITS CONCENTRATES UP TO 200 DEG C,
California Univ., San Diego, La Jolla.
L. A. Bromley.
OSW R and D Progr Rept No 227, Dec 1966. 54 p, 32 fig, 10 ref.
Identifiers: *Physical properties, *Thermal properties, Thermodynamics, *Thermal capacity.

Heat capacities at one ATM pressure have been measured for seawater solutions over a concentration range of 1.1 to 11.7% salinity and a temperature range of 2 to 80 deg C. The accuracy is about 0.1%. Heat capacities as a function of temperature

are described by parabolic equations which yield values within one part per thousand of the experimental values. Near natural seawater concentration the relationship is linear. A nomograph is given from which heat capacities of sodium chloride solutions and for a synthetic seawater concentrate are compared with those of seawater solutions. Temperature coefficients of the heat capacities are also compared. The development of the design and fabrication of the pressure calorimeter are described.

HEAT-MASS TRANSFER TO PARTICLES SUSPENDED IN AGITATED LIQUIDS: 1. TRANSPORT BETWEEN LIQUIDS AND SPHERICAL PARTICLES IN A TANK,
Massachusetts Inst. of Tech., Cambridge.
T. K. Sherwood, and P. L. T. Brian.
Office Saline Water Res and Develop Progr Rep No 334, Chapter 1, p 1-24, Apr 1968. 24 p, 5 fig, 27 ref. Available from the Superintendent of Documents, US Gov't, Printing Office, Washington, DC, 20402, for $0.40 per copy. Grant No 14-01-0001-546 (OSW).

Descriptors: *Heat transfer, *Melting, Mass transfer, Convection, Ice, Correlation analysis, Statistical methods, Grivity, Density, Thermodynamics, Mixing, Turbulence.
Identifiers: *Agitated liquid, Ice spheres.

Data are reported for heat transfer from water to melting ice spheres and for mass transfer in the case of dissolving spheres of pivalic acid suspended in water agitated in a stirred vessel. The transport coefficients are found to depend on agitator power input but not on agitator design, in agreement with the Kolmogoroff theory. These experimental results are used with others in the literature to develop a correlation involving Nusselt and Prandtl or Schmidt numbers together with a dimensionless group involving agitation power. The correlation is essentially independent of solid-liquid density ratio in the range 0.8 to 1.25, and in this range the gravity group also appears to be unimportant. (Carstea-USGS)
W70-01297

HEAT-MASS TRANSFER TO PARTICLES SUSPENDED IN AGITATED LIQUIDS: 2. EFFECTS OF TRANSPIRATION AND CHANGING DIAMETER TO SPHERES,
Massachusetts Inst. of Tech., Cambridge.
T. K. Sherwood, and P. L. T. Brian.
Office Saline Water Res and Develop Progr Rep No 334, Chapter 2, p 25-58, Apr 1968. 34 p, 12 fig, 3 tab, 15 ref. Available from the Superintendent of Documents, US Gov't Printing Office, Washington, DC, 20402, for $0.40 per copy. Grant No 14-01-0001-546 (OSW).

Descriptors: *Heat transfer, *Melting, *Mass transfer, Convection, Ice, Correlation analysis, Statistical methods, Gravity, Density, Thermodynamics, Mixing, Turbulence.
Identifiers: *Agitated liquid, Viscous flow, Ice spheres.

Mass transfer to spheres suspended in an agitated liquid was studied experimentally and theoretically. Finite-difference solutions are obtained from a sphere to a fluid flowing past it in steady viscous flow. Effects of a transpiration velocity at the surface of the sphere and of a continuously changing sphere diameter are included. A normalized presentation of these effects is quite insensitive to the bulk flow Peclet number. When these theoretical corrections for transpiring and shrinking spheres are applied to the mass transfer data for ice spheres melting in an agitated brine bath, the corrected mass tranfer coefficients are brought into agreement. This aggreement suggests that the theoretical results apply with reasonable accuracy to a shrinking and transpiring sphere suspended in a turbulent liquid. (Lang-USGS)

SUBSURFACE IMPLICATIONS FROM SURFACE HYDROGRAPH ANALYSIS,
Georgia Inst. of Tech., Atlanta. School of Engineering.
Willard M. Snyder.
Proc 2nd Seepage Symp, Phoenix, Ariz, Mar 25-27, 1968, Agr Res Serv Rep 41-147, p 35-45, 1969. 11 p, 6 fig, 1 tab.

Descriptors: *Hydrograph analysis, *Rainfall-runoff relationships, *Computer models, *Computer programs, Digital computers, Data processing, Mathematical models, Hydrologic budget, Rainfall, Antecedent precipitation, Streamflow forecasting.
Identifiers: Computer watershed models.

Computer-based techniques for hydrograph analysis are useful in studying processes by which a watershed receives, stores, conveys, and releases water to form stream discharge. Computer techniques differ from conventional procedure in several respects. The total response of the streamflow to storm input is analyzed. Only flow antecedent to the storm under analysis is separated. The hydrograph is open ended. By this is meant that it is not necessary to specify a time at which flow of a certain category becomes zero. The surface hydrograph is separated into a large number of time-of-flow categories after, and based upon, the storm analysis. Every storm in a watershed record can be treated. It is not necessary to limit so-called unit hydrograph derivation to a few selected storms. The procedures described represent a complete 'package' of computer programs for processing of hydrologic records. The techniques of hydrograph analysis are treated in detail. Each step in the data processing procedures is described briefly so that the hydrograph analysis can be visualized in proper context. (Knapp-USGS)

C. A. Onstad, and D. G. Jamieson.

Proc 2nd Seepage Symp, Phoenix, Ariz, Mar 25-27, 1968, Agr Res Serv Rep 41-147, p 46-55, 1969. 10 p, 9 fig, 10 ref.

Descriptors: *Rainfall-runoff relationships, *Parametric hydrology, *Mathematical models, *Base flow, Computer models, Computer programs, Demonstration watersheds, Hydrologic budget, Hydrograph analysis, Data processing, Recession curves, Seepage, Groundwater movement, Runoff forecasting, Streamflow forecasting.
Identifiers: Coshocton (Ohio), Watershed models.

The relation of base flow to precipitation events was studied by hydrograph analysis using data from an ARS experimental watershed at Coshocton, Ohio. Models of base flow in watershed systems are reviewed and a new watershed simulation model is proposed. The model presented is an attempt to objectively simulate the various subsurface flow regimes. Despite the necessity of inferring the inputs to the various flow regimes, the model is realistic since it utilizes only the measured response of each flow regime. The purpose of the model is not merely to separate base flow from the total hydrograph but to simulate and later synthesize the land phase of the hydrologic system. Although it possesses thresholds which make the system nonlinear, linear reservoir theory is assumed applicable above the thresholds. The majority of parameters are inserted as measurable quantities. The system is flexible--reservoirs can be added, subtracted, or combined depending upon the response of the particular watershed. The simulation has only been demonstrated at Coshocton, Ohio, and therefore, requires further testing in differing physiographic areas. (Knapp-USGS)

STUDY OF THE RELATIONSHIP BETWEEN SURFACE AND SUBSURFACE FLOWS IN THE VIDOURLE (GARD) BASIN (FRENCH),
Montpellier Univ. (France). Faculte des Sciences.
Claude Drogue.
Chronique d'Hydrogeologie, No 10, p 49-57, 1967. 6 fig, 6 ref.

Descriptors: *Runoff, *Subsurface flow, *Streamflow, *Karst, Aquifers, Infiltration, Hydraulic properties, Geology, Mapping, Limestones, River basins, Water sources, Discharge (Water), Hydrologic data, Gaging stations, Floods, Storm runoff.
Identifiers: *France, Vidourle (Gard) basin.

This article is a brief study of the water regime of the Vidourle River of Southern France, which passes through both karstic and non-karstic areas. The study based on hydrological and geological data shows that the greatest part of the streamflow in the upper reaches of the river is lost by infiltration into the karstic limestone rocks; however, this lost flow appears in the lower reaches. This water circulation can be explained by high infiltration coefficients and high water loss characterizing the subterranean runoffs. (Gabriel-USGS)

THERMAL RADIATION FROM THE ATMOSPHERE,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
Sherwood B. Idso, and Ray D. Jackson.
Journal of Geophysical Research, Vol 74, No 23, p 5397-5403, Oct 20, 1969.

Descriptors: *Thermal radiation, *Atmosphere, *Air temperature.

A theoretical analysis of atmospheric thermal radiation was done and revealed that previous formulas relating this parameter to screen-level air temperature have lacked universal applicability. New considerations indicate that the effective emittance of the atmosphere is a minimum at 273 deg K and that it increases symmetrically to approach unity exponentially at higher and lower temperatures. A formula is developed that meets these standards and fits experimental data from Alaska, Arizona, Australia, and the Indian Ocean with a correlation coefficient of 0.992. The atmospheric radiation R, integrated over all wavelengths, is specified solely in terms of the screen-level air temperature T as R= (sigma) (T to the 4th power) (1 - c exp (- d (273 -T)sq)) where c and d are constants having values of 0.261 and 0.000777, respectively. It appears that the formula may be valid at all latitudes and seasons. (Guerrero-Vanderbilt)

EDDY DIFFUSION COEFFICIENTS DUE TO INSTABILITIES IN INTERNAL GRAVITY WAVES,
Southwest Center for Advanced Studies, Dallas, Tex.
R. R. Hodges, Jr.
Journal of Geophysical Research, Space Physics, Vol 74, No 16, p 4087-4090, Aug 1, 1969. 11 ref, 1 fig.

Descriptors: *Diffusion, *Turbulence, *Atmosphere, Heat transfer.
Identifiers: *Internal gravity waves, *Eddy diffusion coefficient, Mesosphere, Thermosphere.

The purpose of this study was to elucidate the role that internal gravity waves play in the generation of turbulence in the mesosphere and lower thermosphere. Internal gravity waves in the upper atmosphere tend to grow in amplitude with increasing height to maintain continuous vertical transport of wave energy. The growth of amplitude of a wave is limited by convective instabilities that must form at the height where the temperature oscillation becomes great enough to include a superadiabatic region. This turbulence attenuates the wave by eddy transport of heat and viscous stress through the wave structure, essentially maintaining a constant amplitude of the wave at greater altitudes. An eddy diffusion coefficient of the order of 10 to the 7th power cm sq/ sec is sufficient to explain the thermal structure of the mesopause region. Sporadic turbulence produced by instabilities in gravity waves is probably an important process of the upper atmosphere. Conclusions were (a) Internal gravity waves are an important source of turbulence in the upper atmosphere. (b) Wave-induced turbulence is the dominant cause of eddy transport throughout the mesosphere and lower thermosphere. (Guerrero-Vanderbilt)

WATER SUPPLY IN COLD REGIONS,
Army Terrestrial Sciences Center, Hanover, N.H.
Amos J. Alter.
Available from Clearinghouse as AD 685 850, for $3.00 in paper copy, $0.65 in microfiche. Cold Reg Sci and Eng Monogr 3, Sec C5a, Jan 1969. 85 p, 62 fig, 8 tab, 228 ref, 1 append. DA Proj 1T062112A130.

Descriptors: *Water supply, *Waste disposal, *Sanitary engineering, *Cold regions, Water treatment, Sewage treatment, Cold weather construction, Permafrost, Tundra.
Identifiers: Cold region sanitary engineering.

The principles involved in cold-region sanitary engineering are not materially different from those of sanitary engineering in temperate climates, but application of these principles is different. Heat conservation, humidity, light, construction and operation costs, and the efficient use of materials and resources are more important in cold regions; biological and chemical reactions are generally retarded at low temperature; and materials and their physical characteristics must be evaluated under cold-region conditions. Thermal analysis of all materials, systems and processes must be included as a part of the design; neglect of this may result in project failure. Availability and use of heat energy are highly important in sanitary engineering systems in cold regions. Water and fuel oil may be comparable in value, and new limits are imposed on design. Unavailability of aggregates, timber and many other common building materials from local sources limits construction. Among the approaches to solving the cold regions water system problems have been (1) encapsulation of the water system, (2) warming of the whole environment, and (3) substitution of a 'bucket brigade' consept for a proper community distribution system. A cold-region community spread over a large area cannot be effectively supplied with water from a conventional central system with long distribution lines. (Knapp-USGS)

PILOT STUDY OF ICE DRIFT IN THE GULF OF ST. LAWRENCE,
Massachusetts Inst. of Tech., Cambridge; McGill Univ., Montreal (Quebec). Marine Sciences Centre; and McGill Univ., Montreal (Quebec). Dept. of Physics.
R. G. Ingram, O. M. Johannessen, and E. R. Pounder.
J Geophys Res, Vol 74, No 23, p 5453-5459, Oct 20, 1969. 7 p, 3 fig, 1 tab, 7 ref.

Descriptors: *Ice, *Drifting (Aquatic), *St. Lawrence River, *Remote sensing, *Instrumentation, Buoys, Wind pressure, Theoretical analysis, Mathematical studies, Currents (Water), Air Meteorology, Seasonal, Latitudinal studies, Tidal effects.
Identifiers: Gulf of St. Lawrence, Ice drift.

A pilot study of ice drift has been made in the Gulf of St. Lawrence. A toroidal buoy with a radio beacon that was set out March 1, 1967, on an ice floe off the Gaspe coast drifted toward the southeast. Seven position determinations were made by the Ice Reconnaissance Aircraft, Meteorological Branch, up to March 20, when the beacon stopped transmitting. The buoy was recovered on May 7 south of the Magdalen Islands. By means of the Reed and Campbell theory, the ice drift due to the wind stress is calculated and the difference between the theoretical drift and the observed drift is assumed to result from surface current. The area between Anticosti Island and the Gaspe coast shows great variability with regard to its surface circulation, as during ice-free months. Furthermore, the analysis indicates that the internal ice stress, which is neglected in the Reed and Campbell theory, should be taken into account in future models. Hourly values of the ice drift velocity indicate that the ice floe is affected by the tidal current. (Gabriel-USGS)

THE SNOW COVER OF THE ANTARCTIC AND ITS ROLE IN THE PRESENT-DAY GLACIATION OF THE CONTINENT,
Akademiya Nauk SSSR, Moscow. Institut Geografii.
V. M. Kotlyakov.
Isreal Program for Scientific Translations, Jerusalem. 1966. Transl from Izdatel'stvo Akad Nauk SSSR, Moscow, 1961. 256 p, 75 fig, 33 tab, 413 ref. Clearinghouse TT 65-50144.

Descriptors: *Snow cover, *Antarctic, *Glaciation, Climatology, Meteorology, Snow surveys, Ice, Sublimation, Research and development, Winds, Temperature, Glaciers, Firn.
Identifiers: *Antarctic snow cover, Katabatic winds, Antarctic ice sheet, Snow-firn layer.

Investigations of the Antarctic snow cover by the USSR in the International Geophysical Year include: (1) climatic and meteorological factors determining the formation of the snow cover; (2) formation of the snow cover; (3) development of the snow-firn cover; (4) some properties of Antarctic snow; (5) peculiarities of the snow cover in different regions of the continent; and (6) evolution and development tendencies of the Antarctic ice sheet. There are 413 references cited in the text. The main characteristics of the formation and development of the Antarctic snow cover have been clarified as a result of half a century of investigation. The formation and development of the snow cover as large ice sheets are determined by the katabatic winds which exist everywhere. The basic processes of ice and firn formation in the Antarctic ice sheet are recrystallization by sublimation and subsidence. The intensity of these processes is primarily a function of temperature of the snow firn layer. Many glaciological problems are solved by studies of the snow-firn cover on glaciers. (Carstea-USGS)

2D. Evaporation and Transpiration

A NOTE ON THE EVAPOTRANSPIRATION FROM A PADDY FIELD,
Kochi Univ. (Japan).
Tokuro Seo, and Nobuyuki Yamaguchi.
Berichte des Ohara Inst fur Landwirtschaftliche Biol, Okayama Univ, Band 14, Heft 3, p 133-143, Nov 1968. 11 p, 3 fig, 2 tab, 10 ref, 2 append.

Descriptors: *Evapotranspiration, *Crops, Micrometeorology, Seasonal, Microenvironment, Heat balance, Dynamics, Land use, Rice, Irrigation water, Plants, Mathematical studies, Soil temperature, Radiation, Winds, Altitude, Roughness coefficient, Water loss, Moisture content.
Identifiers: *Japan, Kurashiki, Rice paddies.

Evapotranspiration from a paddy field at Kurashiki, Japan was analyzed for several days during the period July to October 1963 by using heat balance and aerodynamic methods. Using the heat balance method, determination of the net radiation is reliable to 5 to 10% and evaluation of thermal exchange is rather difficult. The aerodynamic method is based on determination of moisture gradients and wind speed gradients. In general, the heat balance method, although it is less satisfactory theoretically since it includes non-meteorological parameters, can be considered as more suitable for evapotranspiration studies of rice fields. ON THE GEOMETRY OF CURRENT RIPPLES IN RELATION TO STABILITY OF FLUID FLOW,
Reading Univ. (England). Sedimentology Research Lab.
J. R. L. Allen.
Geografiska Annaler, Ser A, Phys Geogr, Vol 51A, No 1-2, p 61-96, 1969. 36 p, 36 fig, 8 tab, 84 ref.

Descriptors: *Ripple marks, *Analytical techniques, *Currents (Water), *Streamflow, Friction, Topography, Model studies, Geology, Sands, Wavelengths, Waves (Water), Mathematical studies, Correlation analysis, Fluid mechanics, Fluid friction, Froude number, Vortices, Hydraulic models.
Identifiers: *Current-ripple geometry, Fluid flow stability.

The relation of geometry of small-scale current ripples to the evolved flow over the bed was investigated analytically and experimentally by assuming fluid stability. Wave-like changes of current-ripple elevations are associated with adjustment of the streambed to three-dimensional fluid motion and are characterized by corkscrew vortices similar to the Taylor-Gorter vortex type. Experiments made with beds of a fine-grained quartz sand reveal that the characteristic wavelength of features due to vortices diminishes with increasing relative roughness and Froude number. An empirical equation connecting the mean wavelengths of spanwise and streamwise features of a rippled bed, with the relative roughness and Froude number, appears to be applicable to the study of much larger dunes formed in water. Wavelength ratios for these dunes overlap in value with ratios measured from subaqueous bed forms. (Gabriel-USGS)

WATER SUPPLIES FOR COULEE DAM NATIONAL RECREATION AREA, WASHINGTON,
Geological Survey, Tacoma, Wash.
Henry W. Anderson, Jr.
Geol Surv Open-file Rep, 1969. 104 p, 32 fig, 16 tab, 16 ref.

Descriptors: *Water resources, *Water demand, *Recreation, Facilities, *Washington, *Grand Coulee Dam, Groundwater, Aquifers, Water wells, Water quality, Water yield, Glacial drift, Streamflow.
Identifiers: Coulee Dam National Recreation Area.

A general evaluation was made of the overall water resources of the Coulee Dam recreation area, Washington and potential water supplies were located and described in detail at several campgrounds where expansion of facilities is anticipated. Although surface water is available from streams at several campgrounds and from Franklin D. Roosevelt Lake, the treatment required of surface-water supplies makes groundwater a preferred source. Most groundwater in Coulee Dam National Recreation Area is available from unconsolidated deposits that formed glacial-lake deltas and glacial outwash in Pleistocene time. Groundwater may possibly be available from the bedrock which includes basalt of the Columbia River Group of Miocene-Pliocene age in the southern part of the area, and the northern part of the area. The project included an evaluation of the water-supply potential at 35 campgrounds and picnic areas. Groundwater supplies were obtained by production wells drilled at 4 sites. Groundwater could be obtained at each of 8 other campgrounds where a detailed study was made, and supplies could be obtained at most of the other 23 campgrounds in the project area. The chemical quality of groundwater in most of the area is good. (Knapp-USGS)

RIP CURRENTS: 1. THEORETICAL INVESTIGATIONS,
Liverpool Univ. (England). Tidal Inst.
Anthony J. Bowen.
J Geophys Res, Vol 74, No 23, p 5467-5478, Oct 20, 1969. 12 p, 7 fig, 25 ref.

Descriptors: *Rip currents, *Mathematical studies, *Theoretical analysis, *Vortices, Water circulation, Coasts, Waves (Water), Frequency analysis, Flow characteristics, Beaches, Shallow water, Barriers.
Identifiers: *Vorticity, Rip current formation.

The nearshore circulation of water on a plane beach produced by a wave train, normally incident on the beach, which has a longshore variation in wave height is investigated theoretically. The radiation stress arising from the excess flux of momentum due to the presence of the waves is found to provide driving terms for a steady flow pattern only inside the surf zone. A circulation pattern is thus produced by a longshore variation in the radiation stress in the surf zone. In shallow water, the radiation stress is proportional to the square of the wave height. The nearshore circulation is therefore directly related to longshore variation in breaker height, currents flowing seaward where the breaker height is low. When the inertial terms are included in the vorticity equation, an increase in the effective Reynolds number produces a narrowing, and consequently a strengthening, of the seaward flow, which suggests an explanation for the existence of the strong, narrow currents known as rip currents. THE USE OF TRACERS TO INVESTIGATE THE RELATIONSHIP BETWEEN MINING SUBSIDENCE AND GROUNDWATER OCCURRENCE AT ABERFAN, SOUTH WALES,
Institute of Geological Sciences, London (England). Dept. of Hydrogeology; and National Coal Board, Ystrad Mynach (Wales).
J. D. Mather, D. A. Gray, and D. G. Jenkins.
J Hydrol, Vol 9, No 2, p 136-154, Oct 1969. 19 p, 6 fig, 5 tab, 12 ref.

Descriptors: *Landslides, *Groundwater movement, *Subsidence, *Mine wastes, *Waste dump, Mine drainage, Coal mine wastes, Disasters, Tracers, Tracking techniques, Ions, Solutes, Dye releases, Permeability, Hydrogeology.
Identifiers: *Wales, *Aberfan.

Four groundwater tracing experiments, using sodium chloride and sodium fluorescein as tracers, were undertaken at Aberfan, Wales in order to investigate the influence of mining subsidence on the pattern of groundwater flow. Measurements indicated that areas subject to tensional strains were characterized by rapid groundwater movement and areas subject to compressional strains by slow or negligible groundwater movement. Boundaries between zones of tensile and compressional strains should be regarded as potential hydraulic discontinuities. Mining subsidence appeared to have contributed to the enlargement of the groundwater catchment draining the tip-complex at Aberfan. (Knapp-USGS)

BASIC RESULTS OF HYDROGEOLOGIC INVESTIGATIONS OF OIL-BEARING REGIONS OF THE NORTHWESTERN SIBERIA (RUSSIAN),
Ministerstvo Geologii, Moscow (USSR).
O. V. Ravdonikas.
Trudy Nauchno-Issledovatel'skogo Instituta Geologii Arktiki, Vol 129, 1962. 194 p, 23 fig, 31 tab, 73 ref, append.

Descriptors: *Oil fields, *Hydrogeology, *Hydrologic properties, *Hydraulic properties, Oil reservoirs, Boreholes, Geology, Geophysics, Groundwater, Water pressure, Water temperature, Mechanical equipment, Instrumentation, Water chemistry, Natural gas, Permafrost.
Identifiers: *USSR, West Siberian oil fields, Oil field hydrogeology.

This monograph is a detailed description of analytical and field methods and techniques necessary in carrying out a reliable hydrogeological exploration for the location of natural gas and oil structures and in forecasting gas and oil possibilities. The greatest part of the monograph, however, comprises the description and the analysis of the results obtained in the northwestern part of Siberia in exploration for oil and gas reservoirs. The monograph contains the following chapters: (1) introduction; (2) investigation methods; (3) hydrogeologic characteristics of the lower reaches of the Yeninsei River; (4) a critical review of borehole data from the Ust'-Port area; (5) groundwaters; (6) conditions affecting the formation of groundwaters; and (7) oil possibilities on the basis of derived hydrogeologic concepts. ON THE POSSIBILITY OF GROUNDWATER AGE DETERMINATION USING TRITIUM-HELIUM-3 METHOD (RUSSIAN),
I. N. Tolstikhin, and I. L. Kamenskiy.
Geokhimiya, No 8, p 1027-1029, Aug 1969. 7 ref.

Descriptors: *Groundwater, *Radioactive dating, *Tritium, *Helium, Meteoric water, Rocks, Aquifers, Streamflow, Radiochemical analysis, Precipitation (Atmospheric), Atmosphere, Porosity.
Identifiers: *Groundwater age determination, Tritium-Helium method.

This brief article gives the pertinent formulas and discusses the procedure for application of Tritium-Helium method for groundwater age determination. The use of the method is based on the assumption that the isotopes of tritium and helium are conserved in the groundwater under investigation. Considerable error occurs when groundwater of relatively young age is mixed with ancient groundwater during its migration underground. In general, age determination using the tritium-helium method can be successful if the addition of radiogenic He-3 is commensurable with or exceeds the atmospheric helium content. (Gabriel-USGS)

WATER-BEARING FISSURES OF THE CEVENOLE GNEISS BASED ON THE RECONNAISSANCE STUDY OF THE SAINT-JEAN-DU-GARD DAM SITE, FRANCE (FRENCH),
Montpellier Univ. (France). Faculte des Sciences.
Par J. Avias.
La Houille Blanche, No 1, p 47-60, 1967. 5 fig, 1 tab, 6 ref.

Descriptors: *Aquifers, *Fissures (Geology), *Igneous rocks, *Damsites, Mapping, Porosity, Permeability, Water storage, Water loss, Petrography, Geology, Density, Structural geology, Drainage water, Erosion, Mathematical studies, Water circulation, Infiltration, Mechanical properties.
Identifiers: Saint-Jean-Du-Gard (France).

Water-bearing fissures of fractured gneiss were investigated using geological, hydrologic, and borehole data recorded at the Saint-Jean-Du-Gard damsite. The recorded data reveal the geometry and distribution of the fissures and altered zones of thickness varying from 35 to 40 m, with their base parallel to the topographical relief caused by Quaternary sinking. The study indicates the possibility of using drainage tunnels and galleries to increase water yield. (Gabriel-USGS)

MATHEMATICAL METHOD (ABAQUE) PERMITTING RAPID EVALUATION OF AQUIFER TRANSMISSIVITIES (FRENCH),
Montpellier Univ. (France). Faculty de Sciences.
R. Plegat.
Bull Int Ass Sci Hydrol, Vol 12, No 4, p 82-85, Dec 1967. 4 p, 1 fig, 1 tab.

Descriptors: *Groundwater movement, *Mathematical studies, *Aquifers, *Transmissivity, Discharge (Water), Theis equation, Dupuit-Forchheimer theory, Pumping, Water wells, Water storage, Water levels, Water level fluctuations, Drainage (Water), Infiltration.
Identifiers: Aquifer transmissivity evaluation, Aquifer testing.

Because recorded aquifer discharge data often permit only very sketchy transmissivity evaluations, a mathematical method is given to evaluate transmissivities. This method is based on the utilization of the Theis and Jacob formulas, using the aquifer storage coefficient, the pumping well discharge, the pumping duration, and the pumping well distance. Although this rapid method cannot replace the normal methods used for transmissivity evaluations, nevertheless, in case of the paucity of data or for obtaining rough transmissivity values, the method can give satisfactory results. A PERTURBATION SOLUTION TO UNSTEADY UNCONFINED GROUND WATER FLOW,
Massachusetts Univ., Amherst. Dept. of Civil Engineering.
Donald Dean Adrian, and Kuang-Mei Lo.
Pap presented at 50th Annu Meeting of Amer Geophys Union, Wash, DC, Apr 21-25, 1969. 22 p, 6 fig, 2 tab, 6 ref. FWPCA Grant No WP-01239-02.

Descriptors: *Unsteady flow, *Aquifers, Base flow, Mathematical models, Equations, Canals, Groundwater movement, Boundary processes.
Identifiers: *Perburbation solution, Partial differential equation, Unsteady unconfined flow.

Unsteady unconfined groundwater flow has been intractable to analytical solutions of the governing nonlinear partial differential equation. Approximation methods for linearizing the governing partial differential equation have been available in the literature; however, the resulting linearized system may not approximate closely the natural groundwater flow, especially near boundaries. The use of perturbation methods is proposed to solve the governing nonlinear partial differential equation for unsteady unconfined flow toward a canal. Finite difference methods and solutions to the linearized partial differential equation have been used to develop independent groundwater profiles to compare with those predicted by the perturbation solution. The perturbation solution appears useful in evaluating aquifer characteristics from drawdown tests. (Carstea-USGS)

DETERMINING PERENNIAL RECHARGE,
Geological Survey, Washington, D.C.
Harold E. Thomas.
In: Groundwater Development in Arid Basins - Symposium, Utah State University, 1967, Proceedings. Utah State University, Logan, p 15-20, 1967. 6 p, 8 ref.

Descriptors: *Groundwater recharge, *Water table, *Utah, Water rights, Appropriation, Great Salt Lake, Aquifers, Irrigated land, Groundwater mining, Safe yield, Groundwater basins, Artesian wells, Seepage, Arid lands, Drawdown, Consumptive use.

The author draws from more than 30 years experience in studying several arid groundwater basins in Utah to determine recharge rates. The rate of recharge was commonly determined by using the equation: recharge equals total discharge plus or minus changes in storage. If a basin is to remain productive over the long-term, then consumptive use must be limited to 'safe yield' or average perennial recharge. Otherwise the aquifer will be 'mined' and the water table will continue to fall. Study areas discussed are Cedar City, Parowan, Escalante Valley, and the East Shore of Great Salt Lake. In the Escalante basin there is little recharge and the water level has declined since 1950, averaging less than 2 feet per year. The East Shore area shows recharge from all sources of about 70,000 acre ft/year of which about 40,000 is estimated to move westward and to be lost to evaporation or to go into the Lake. There seems to be a good case for further development. However, such additional use might lower existing artesian pressure in wells and raise a legal question of interference with existing rights. (Crouse-Arizona)

2G. Water in Soils

FLOW AND RETENTION OF WATER IN LAYERED SOILS,
Agricultural Research Service, Washington, D.C.
D. E. Miller.
Agr Res Serv Conserv Res Rep No 13, May 1969. 28 p, 18 fig, 12 tab, 11 ref.

Descriptors: *Soil water movement, *Water storage, *Soils, *Stratification, Permeability, Anistropy, Unsaturated flow, Field capacity, Sands, Clays, Infiltration, Particle size, Moisture content, Hydraulic conductivity.
Identifiers: Stratified soils.

Many irrigated areas are on highly stratified soils, including those with coarse layers in the profile. The water retained by a soil is affected by the characteristics of the entire wetted part of the profile. Soil overlying sand or gravel contains about 6% more water than soil not so underlain. A silt loam soil underlain by sand drains to a water content of about 40% by volume as compared to a 1/3-bar value of 27% by volume. Field water-holding capacities of fine sandy loam soils underlain by coarser materials are 50 to 60% greater than 1/3-bar values. The effect of coarse layers in the profile on soil water-holding characteristics must be understood if in such soils irrigation is to be managed properly. Research data showing the effect of coarse layers on water retention are summarized and ways of estimating water-retention properties of layered soils are discussed. (Knapp-USGS)

TRANSIENT RADIAL FLOW IN UNSATURATED SOIL,
North Carolina State Univ., Raleigh. Dept. of Biological and Agricultural Engineering; and North Carolina State Univ., Raleigh. Dept. of Soil Science.
Sun-Fu Shih, and George J. Kriz.
Pap No H-87 presented at 50th Annu Meeting of Amer Geophys Union, Wash, DC, Apr 21-25, 1969. 18 p, 4 fig, 14 ref.

Descriptors: *Soil water movement, *Unsaturated flow, *Soil water, Pipes, Equations, Continuity equation, Gravity, Diffusivity, Mathematical studies.
Identifiers: *Transient radial flow.

A mathematical solution of a problem of unsaturated transient radial flow in a homogeneous soil surrounding a long infinitely permeable pipe that contains water flowing under pressure was developed. The equation that described the problem combined Darcy's law and the equation of continuity into an appropriate radial flow equation that included the influence of gravity. The flow was assumed symmetrical with respect to the vertical axis. It was also assumed that no flow took place beyond a certain radial distance from the pipe. Using a mean value for the soil water diffusivity, the results showed that the effect of the gravity term decreased with increasing time. (Carstea-USGS)

RELATIONSHIP OF WATER QUALITY AND SOIL PROPERTIES TO SEEPAGE PROBLEMS,
Seepage Control, Inc., Phoenix, Ariz.
J. Harlan Glenn.
Proc 2nd Seepage Symp, Phoenix, Ariz, Mar 25-27, 1968, Agr Res Serv Rep 41-147, p 1-7, 1969. 7 p, 11 fig, 7 ref.

Descriptors: *Seepage, *Reservoir leakage, *Water quality, *Soil water movement, Expansive clays, Ion exchange, Grouting, Leakage, Linings, Permeability, Soil sealants, Surface sealing, Water loss.
Identifiers: Permeability control, Seepage control.

Actual reservoir seepage is often 5-10 times as high as predicted by laboratory tests. Usually the differences are because the contractor does not obtain the compaction of soil assumed by the laboratory and because the effect of water quality on seepage is not determined. Essentially, the permeability of clay-bearing soil is low when in equilibrium with water containing a high proportion of Na to Mg+ Ca, and high in equilibrium with water containing a low proportion of Na. Increases in total salt concentration tend to increase permeability. Treatment of soils with salts or cement can control permeability as well as swelling and cracking properties. (Knapp-USGS)

Proc 2nd Seepage Symp, Phoenix, Ariz, Mar 25-27, 1968, Agr Res Serv Rep 41-147, p 17-22, 1969. 6 p, 5 fig, 1 tab. OWRR Project A-014-MINN.

Descriptors: *Induced infiltration, *Surface-groundwater relationships, *Analog models, Recharge, Drawdown, Water levels, Water level fluctuations, Model studies, Analog computers, Pumping, Water wells, Water table, Glacial drift, Aquifers.
Identifiers: Miami River (Ohio).

In evaluating groundwater resources, streambeds must be simulated in mathematical and analog models in such a way that the following conditions are considered: (1) Leakage of water through a streambed is directly proportional to the drawdown beneath the streambed until the water table declines below the streambed. Thereafter, induced infiltration remains constant provided the stream stage and temperature remains stationary; (2) provided that the water table remains below the streambed, leakage of water through a streambed is directly proportional to the average depth of water in the stream and varies with stream-stage changes and changes in the temperature of the surface water. An analog study was made of the outwash aquifer in the Miami Valley, Ohio. With correct streambed simulation, an 8-well collector system resulted in simulated water level declines of over 4 ft along a 5,500 ft reach of the river, but with incorrect streambed simulation, declines exceed 4 ft along only 3,200 ft of river. CHANGES IN WATER QUALITY DURING SEEPAGE,
California Univ., Davis. Dept. of Water Science and Engineering; and Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
D. R. Nielsen, and R. D. Jackson.
Proc 2nd Seepage Symp, Phoenix, Ariz, Mar 25-27, 1968, Agr Res Serv Rep 41-147, p 8-13, 1969. 6 p, 5 fig.

Descriptors: *Leaching, *Ion exchange, *Biodegradation, Solutes, Soil water movement, Water quality, Permeability, Clays, Soils, Ion transport, Mass transfer, Tracers, Tracking techniques, Laboratory tests.
Identifiers: Water quality alteration.

Water quality is changed when the soil solution interacts with soil particle surfaces during seepage. The interaction is influenced by particle charge, mineralogy, and particle geometry. Experiments were conducted on altering the efficiency of the ion exchange process by altering seepage rates at various depths in soil profiles. The rates of movement of solutes vary considerably, so the use of single-tagged components as tracers yields relatively little information. Leaching columns are used to study decomposition of organic solutions passing through soil. (Knapp-USGS)

REVIEW OF METHODS FOR MEASURING AND PREDICTING SEEPAGE,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
Herman Bouwer, and Robert C. Rice.
Proc 2nd Seepage Symp, Phoenix, Ariz, Mar 25-27, 1968, Agr Res Serv Rep 41-147, p 115-120, 1969. 6 p, 1 tab, 12 ref.

Descriptors: *Seepage, *Canal seepage, *Soil water movement, Mathematical studies, Tracers, Tracking techniques, Ions, Water loss, Hydrologic budget, Water balance, Steady flow, Unsteady flow, Groundwater movement, Analog models, Computer models.
Identifiers: *Seepage forecasting.

Methods for measuring and predicting seepage from open channels are reviewed. They include the inflow-outflow, ponding, seepage meter, salt penetration, and mathematical techniques. Quantitative information of seepage losses from irrigation or natural channels can be obtained by direct measurement on the channel or by calculation. The second approach, in which seepage is calculated from the hydraulic conductivity of the soil materials and the boundary conditions of the flow system, will be of particular value for canals that are still in the planning stage, for example, in determining desired canal capacities or canal locations for minimum total seepage losses. The methodology for direct measurement or calculation of seepage from channels or reservoirs has progressed sufficiently to enable acquisition of quantitative seepage data for a wide variety of conditions. (Knapp-USGS)

FIELD EVALUATION OF SEEPAGE MEASUREMENT METHODS,
Idaho Univ., Moscow. Dept. of Civil Engineering; and Agricultural Research Service, Kimberly, Idaho. Snake River Research Center.
C. E. Brockway, and R. V. Worstell.
Proc 2nd Seepage Symp, Phoenix, Ariz, Mar 25-27, 1968, Agr Res Serv Rep 41-147, p 121-127, 1969. 7 p, 3 fig, 2 tab.

Descriptors: *Canal seepage, *Infiltration, Soil water movement, Groundwater movement, Hydrologic budget, Water balance, Flowmeters, Streamflow, Surface-groundwater relationships, Statistical methods, Irrigation.
Identifiers: *Seepage meters.

Ponding tests, seepage meters, and inflow-outflow methods of measuring seepage from canals are described and evaluated. The study was performed in 1965 and 1966 on a 4.5-mile reach of the A and B Irrigation District Main Canal near Paul, Idaho. It is 25 to 30 ft wide with a gradient of about 0.5 ft per mile and flows at a depth of 5 to 5.5 ft during the irrigation season. Soils throughout the test reach are very uniform and consist almost entirely of Portneuf silt loam. A compacted, slightly cemented silt layer from 12 to 24 inches thick intersects the canal cross section throughout most of the test reach. The flow system beneath the entire test reach is under tension gradients due to an impending layer near the soil surface of the canal cross section. Devices for recording water measurement were installed at the inlet and outlet and at all turnouts on the reach. A water budget for the irrigation season was maintained on this reach for 3 yr, and the loss rates for 2-wk periods were computed. Of the available methods for evaluating seepage losses, the ponding test is the most accurate but the most expensive. The use of seepage meters for obtaining estimates is fast and economical. Inflow-outflow methods are usually too expensive to be used for short-duration seepage measurements. (Knapp-USGS)

Identifiers: *Spitsbergen, Trullvatnet Lake.

A sediment core from Trullvatnet Lake of Murchisonfjord area was examined. The sediments of this 3 m-long core cover a period of about 7000 years, as determined by a C-14 analysis, and show a sequence of two marine-lacustrine contacts in the lower region. The core indicates the renewed connection with the sea of the basin between about 5500 and 4745 years ago. This connection was followed by a final isolation suggesting an interruption in the general trend of shoreline displacement. (Gabriel-USGS)

Descriptors: *Lakes, *Geomorphology, *Permafrost, Frost action, Altitude, Climates, Carbon, Radioactivity, Mapping, Geology, Cracks, Frequency analysis, Erosion, Glaciation.
Identifiers: *Northern Norway, Palsas, Pingos.

This paper discusses the palsas, pingo-like frost mounds, and circular to oval lakes having characteristics of both the palsa and the pingo groups in northeastern Scandinavia. The lakes differ from other lakes of regular shape by being enclosed by a low, uniform wall. Palsas are the most frequent permafrost features in Scandinavia. Palsas are dry low ridges, usually in bogs. The circular lakes are interpreted as a collapse stage of frost mounds originated as palsas or as pingos. Climatological and temporal factors are analyzed to explain the collapse features and fossil, low-elevation rings, present in the area. (Gabriel-USGS)

WATER TEMPERATURES IN A SHALLOW LAKE DURING ICE FORMATION, GROWTH AND DECAY,
Army Terrestrial Sciences Center, Hanover, N.H.
M. A. Bilello.
CRREL, Research Report 213, Dec 1967. 24 p, 15 fig, 34 ref.

Descriptors: *Lake ice, *Lake temperatures.

Continuous water temperature measurements were made in a shallow lake in upper Michigan prior to and during ice formation, and during ice growth and decay. Several full circulations or 'overturns' at 4 deg C were observed during autumn and the temperature throughout the lake just prior to complete freeze-over reduced to a minimum of+0.2 deg C. After a permanent ice cover had formed, the water beneath the ice began to warm up. Within a 25-day period during December the water temperature near the bottom of the lake increased from+0.3 deg C to 3.0 deg C. Quantitative analysis of this heat gain showed that it came principally from the energy stored during the summer in the underlying soils. Evaluation of the effect of solar radiation demonstrated that the sun during December contributed very little heat to the water because of the absorption qualities of the cover of snow and bubbly ice. During the ice thaw period in April a unique reduction in temperature was recorded throughout the main mass of water. Since the lake is thermally stratified, it was assumed that this cooling could only result from mechanical action in the water. This phenomenon probably takes place as the surface water from melting snow around the area flows into the lake and causes overturning. (Upadhyaya-Vanderbilt)

NUTRIENT LIMITATION OF SUMMER PHYTOPLANKTON GROWTH IN CAYUGA LAKE,
Cornell Univ., Ithaca, N.Y.
D. H. Hamilton, Jr.
Limnology and Oceanography, Vol 14, No 4, p 579-590, July 1969. 3 fig, 9 tab, 32 ref.

Descriptors: *Phytoplankton, *Limiting factors, *Nutrients, *Primary productivity, Phosphates, Silicates, Citrates, Bioassay, New York, Lakes, Inhibition, Algae, Diatoms, Eutrophication, Carbon radioisotopes, Chlorophyll, Hydrogen ion concentration, Magnesium, Calcium.
Identifiers: *Enrichment experiments, *Nutrient limitation, Cayuga Lake (NY), Asterionella formosa, Synedra, Melosira, Dinobryon, Fragilaria, Radiocarbon method, Finger Lakes (NY), Rodhe's solution VIII, Nutrient limitation, Carbon-14.

Author describes experiments performed to determine the effect of defined culture medium components on natural phytoplankton populations. Samples collected from Cayuga Lake (Ithaca, New York) at 2-3 day intervals from 20 July through 18 August were placed in an enrichment medium (Rodhe's solution VIII). Assimilation was measured with radiocarbon (C-14). Major algal culture components were Asterionella formosa and unidentified species of Synedra, Melosira, Dinobryon, and Fragilaria. Results indicated an enhancement effect with calcium nitrate, due apparently to the calcium element. Magnesium sulfate and ferric citrate-citric acid were irregularly inhibitory. Phosphate failed to stimulate cultures and occasionally proved inhibiting. Nutrient combinations yielded variable results; author states this may be due to phenomena peculiar to the sample bottles or to changing composition and alternatively, due to physiology of the phytoplankton populations. Tabular data include results and summary of enrichment experiments. (Voightlander-Wisconsin)

PHOSPHATE ADSORPTION AND ISOTOPIC EXCHANGE IN LAKE MUDS,
Copenhagen Univ., Hillerod (Denmark). Freshwater-biological Lab.
Sigurd Olsen.
International Association of Theoretical and Applied Limnology, Proceedings, Vol 13, p 915-922, Feb 1958. 8 fig.

Descriptors: *Lakes, *Phosphates, *Adsorption, *Phosphorus radioisotopes, *Oxidation-reduction potential, Iron compounds, Cycling nutrients,

Water pollution sources, Carbonates, Sediment-water interfaces, Calcium, Oligotrophy, Eutrophication.
Identifiers: *Phosphorus fixation, *Phosphorus-32, *Phosphorus-31, *Isotopic exchange, *Lake muds, Ferrous sulfide, Chemisorption, Freundlich isotherm, Specific activity, Contact time, Denmark, Lake Fureso (Denmark), Lake Grane Langso (Denmark).

Equilibration of phosphate between water and sediment depends on many factors: temperature, redox potential, contents of iron and calcium, and the contact time. The described method, using radiophosphorus (P-32), permits simultaneous appraisal of opposing processes occurring in liquid and solid phases of the lake at welldefined oxidation-reduction levels. In the presence of oxidized sediments, the phosphate equilibrium may be expressed as the difference between its gross adsorption, following the Freundlich isotherm, and its liberation. The presence of iron in reduced sediments precludes a mathematical expression of the processes. (Wilde-Wisoncsin)

LIMNOLOGICAL EFFECTS OF FERTILIZING BARE LAKE, ALASKA,
Washington Univ., Seattle. Dept. of Zoology.
Philip R. Nelson, and W. T. Edmondson.
Fishery Bulletin of the Fish and Wildlife Service, No 102, p 415-436, 1955. 6 fig, 5 tab, 53 ref.

Descriptors: *Photosynthesis, *Limnology, *Alaska, *Fertilization, *Hydrogen ion concentration, *Eutrophication, Nutrients, Fish management, Primary productivity, Secondary productivity, Zooplankton, Phytoplankton, Oxygen, Transparency, Water pollution effects, Rotifers, Planktonic crustaceans, Salmon, Biomass.
Identifiers: *Bare Lake (Alaska), *Sodium nitrate, *Superphosphates, Ploesoma truncatum, Keratella cochlearis, Biotic relationships, Fish growth, Secchi disc transparency, Light-and-Dark bottle techniques.

Results are reported of experiment in which Bare Lake, Alaska (49 hectares; depth: mean--4.0 meters, maximum--7.5 meters) was fertilized with objective of bolstering a declining salmon fishery. Application of 2960 kilograms sodium nitrate and 1135 kilograms superphosphate (19%) annually during four successive years resulted in large increases in photosynthesis rate. Following each annual fertilizer application, phytoplankton increased manyfold and the transparency (Secchi disc) decreased from about 6 to less than 2 meters. The pH of water increased from 7.0 to 9.0. Rates of photosynthesis (dark and light bottle) were increased by factors of 2.5 to 7 in period 10 days after fertilization as compared to similar pre-fertilization interval. Egg production of rotifers apparently increased as result of augmented food supply. Failure of planktonic crustaceans to significantly increase their population size during 1950-1952 period might be attributed to their long life cycle and effectiveness of their predators. Contents of nitrates and phosphates fell to undetectable levels in a few days after application of salts. Salmon leaving the lake were longer and heavier in successive years, suggesting a response to increased food supply. (Wilde and Eichhorn-Wisconsin)

ROOT SURVEY METHODS FOR HYDROLOGICAL EXPERIMENTS,
Ministry of Works, Wellington (New Zealand); and Geological Survey, Denver, Colo.
G. J. Blake, and F. A. Branson.
J Hydrol (New Zeal), Vol 8, No 1, p 3-7, 1969. 5 p, 15 ref.

Descriptors: *Root systems, *Soil-water-plant relationships, *Reviews, Bibliographies, Surveys, Laboratory tests, Root distribution, Root development, Tracers, Water utilization, Water balance, On-site tests.
Identifiers: Root (Plant) surveys.

The roots of a plant are those parts which are normally below the surface of the soil. Root distribution is a very important factor in many hydrological studies and may be defined by the volume and/or weight of roots present, their mode of branching and diameter, their vertical distribution, and their lateral distribution in the soil profile. Evapotranspiration, infiltration, soil moisture and ground water are all affected by the presence or absence of roots. The primary functions of the root are anchorage, the absorption of water and inorganic salts in solution, the conduction of these to the stem, and the modification of moisture stresses and porosity of the soil. The root survey methods reviewed are trench profiles, monoliths, soil cores, tracer studies, soil moisture studies, and various laboratory methods. (Knapp-USGS)

2J. Erosion and Sedimentation

BRAHMAPUTRA RIVER: CHANNEL PROCESSES AND SEDIMENTATION,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
James M. Coleman.
Sediment Geol, Vol 3, No 2/3, p 129-239, Aug 1969. 111 p, 48 fig, 7 tab, 58 ref. Proj No Nonr 1575 (03), Task Order No NR 388 002.

Descriptors: *Sediment transport, *Streamflow, *Bed load, *Channel morphology, Meanders, Braiding, Sediment load, Deltas, Sand waves, Sedimentary structures, Hydrologic data, Alluvial channels.
Identifiers: *Brahmaputra River, *India, *Pakistan.

The Ganges and Brahmaputra Rivers combined have formed a 23,000 sq mi delta, one of the largest in the world. These rivers originate within the Himalayan Mountains, and drain an enormous land area before entering East Pakistan. The combined rivers carry nearly 6 million cusecs of water to the Bay of Bengal. The rivers are heavily charged with sediment, transporting approximately 13 million tons of suspended sediment per day during flood. The large discharge and heavy sediment load cause the rivers to be extremely unstable, and the channels are constantly migrating laterally. The long-term patterns of river migration indicate that the Ganges has been migrating eastward, whereas the preferred migration of the Brahmaputra is westward. The Brahmaputra River displays a braided pattern in plan view, and short-term channel migration is quite drastic, with rates of movement as high as 2,600 ft a year being common. During low-river stage, trenches on the various exposed bars revealed the type of bedding formed by migration of the various bedforms. Crossbedding measurements at these stations were recorded and compared to sand body trends. The combined Bengal Basin rivers deliver some 1 billion tons of suspended sediment a year to the Bay of Bengal. Most of the sediment brought to the bay bypasses the bar and continues on into deeper water through a canyon. Thus in deep water a subaqueous delta is being formed that dwarfs the subaerial delta. PRESENT EVOLUTION OF SLOPES IN THE CARPATHIANS USING FIXED OBSERVATIONS AS AN EXAMPLE (FRENCH),
T. Gerlach.
Evolution Des Versants, Proc Symp de Germorphologie, Liege-Louvain, Belgium, June 8-16, 1966, Vol 40, p 129-138, Liege Univ, 1967. 3 fig, 2 photo, 7 ref.

Descriptors: *Geomorphology, *Slopes, *Erosion, *Mass wasting, Streamflow, Gravity, Soils, Washouts, Leaching, Creep, Ice, Freezing, Winds, Wind velocity, Vegetation effects, Forests, Infiltration, Biochemistry, Pleistocene epoch.
Identifiers: *Poland, Carpathians, Slope evolution.

The present evolution of slopes was investigated for a 4-year period using a small stream basin of 23 sq kw, located in the Polish area of the Carpathians. The rate of contemporary slope changes varies from place to place. The most important processes modifying the slopes are stream erosion and gravity mass movements, slumping in particular. Besides slumping the following processes (given in order of their importance) influence the evolution of slopes: soil washing; solution and leaching; soil creep; displacement through needle-ice; and uprooting of trees by wind action. In cultivated areas the periglacial slopes are subject to particularly rapid transformation. In areas under permanent vegetation cover (meadows and forests), soil washing, soil creep, and displacement through needle-ice are insignificant. Forested slopes and slopes covered by meadows favor water infiltration, leaching, and

biochemical processes, although all these processes do not significantly change the existing slope profiles. (Gabriel-USGS)

REEVALUATING THE MEASUREMENTS OF SOLID DISCHARGES IN SUSPENSION, REPUBLIC OF CHAD (FRENCH),
Office de la Recherche Scientifique et Technique Outre-Mer, Paris (France).
Bernard Billon.
Cahiers ORSTOM Ser Hydrol, Vol 5, No 2, p 3-13, 1968. 5 fig, 7 tab.

Descriptors: *Suspended load, *Suspension, *Discharge measurement, *Discharge (Water), Measurement, Hydrologic data, Laboratory equipment, Analytical techniques, Analysis, Density, Streamflow, Salinity, Chlorides, Temperature, Humidity, Lakes, Rivers, Floods.
Identifiers: Republic of Chad, Chari River, Lake Chad.

The work done by the French Office of the Scientific and Technical Researchs Overseas, in the Chad Republic is described. The discussion includes: (1) the method; (2) the causes of the errors involved in the measurements; (3) measurement scheme; and (4) the results of 4 measurements recorded on the Chari River at Fort-Lamy. The concentration of solid particles in suspension in the Chari River increases from surface to bottom with transversal variations of 30 to 50% in a distance of a few tens of meters. Mean concentrations of these suspended particles in the waters of the Chari River decrease rapidly at the end of August and then increase slowly, without being strongly affected by the abruptly rising waters of October 15. (Gabriel-USGS)

A MATHEMATICAL MODEL FOR THE DESCRIPTION OF THE OPTICAL PROPERTIES OF TURBID WATER IN TERMS OF SUSPENDED PARTICLE SIZE AND CONCENTRATION,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
Jerome Williams.
Tech Rep 47, Chesapeake Bay Inst, Johns Hopkins Univ, Ref No 68-17, Nov 1968. 16 p, 6 fig, 5 ref. Available from Clearinghouse as AD-679 168 for $3 in paper copy, 65 cents in microfiche. Proj No NR 083-016, Contract No Nonr 4010 (11).

Descriptors: *Turbidity, *Suspended load, *Mathematical models, *Estuaries, Streams, Bays, Statistical models, Mathematical studies, Optical properties, Opacity.
Identifiers: Underwater transparency, Water transparency, Suspended sediments.

A mathematical model is developed for a hypothetical suspensoid of particulate matter in water. The assumptions are that the particles are homogeneously distributed throughout the medium, the particles all are the same size, and they are all spherical in shape. The resulting expressions relate the particle radius and concentration to extinction coefficient, beam attenuance coefficient, and upwelling light. A logarithiconormal distribution is developed. It is concluded that this model does not supply enough data to determine the statistical parameters of this distribution. (Knapp-USGS)
W70-01285

DETERMINATION OF PARTICLE SIZE AND CONCENTRATION FROM PHOTOMETER AND SECCHI DISC MEASUREMENTS,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
Jerome Williams.
Tech Rep 48, Chesapeake Bay Inst, Johns Hopkins Univ, Ref No 68-18, Nov 1968. 12 p, 3 fig, 3 ref. Available from Clearinghouse as AD-679 169 for $3 in paper copy, 65 cents in microfiche. Proj No NR 083-016, Contract No Nonr 4010 (11).

Descriptors: *Turbidity, *Particle size, *Photometry, *Mathematical models, Opacity, Instrumentation, Estuaries, Bays, Suspended load, Sea water, Optical properties, Light intensity.
Identifiers: Submarine photometers, Secchi disc.

The mathematical model developed by the Chesapeake Bay Institute is extended to allow for direct calculation of particle size and concentration from optical data. The optical parameters utilized are such that black and white Secchi Discs coupled with a submarine filter photometer are the only instruments required to determine equivalent optical radii and particle concentration values. (Knapp-USGS)
W70-01286

THE ROLE OF THE EQUILIBRIUM CONCEPT IN THE INTERPRETATION OF LANDFORMS OF FLUVIAL EROSION AND DEPOSITION,
Maryland Univ., College Park.
Frank Ahnert.
Evolution Des Versants, Proc Symp Int de Geomorphologie, Liege-Louvain, Belgium, June 8-16, 1966, Vol 40, p 23-41, 1967. 19 p, 8 fig.

Descriptors: *Equilibrium, *Geomorphology, *Erosion, *Deposition (Sediments), Topography, Mathematical studies, Climatology, Dynamics, Slopes, Slope stabilization, Weathering, Bedrock, River basin development, Energy.
Identifiers: *Landform dynamics.

The role of the dynamic equilibrium concept in the interpretation of landforms of fluvial erosion and deposition was analytically investigated, neglecting at first the effect of climate, structure, and differential rock resistance. This partial neglect was based on the belief that these factors only modify the removal-supply relationship without invalidating the system concept of relating the rates of supply and removal of the waste to the landform. This concept of equilibrium recognizes the balance of energy entering and leaving the system, where the rates of waste supply and waste removal are merely the measurable expression of this balance. Moreover, this concept of equilibrium permits, besides the continuous passing through of exogenic energy, the discontinuous insertion of endogenic energy in the form of tectonic deformation into the system. (Gabriel-USGS)
W70-01288

QUANTITATIVE RESEARCH OF SLOPE DEVELOPMENT IN CZECHOSLOVAKIA,
Czechoslovak Academy of Sciences, Brno. Inst. of Geography.
J. Demek.
Evolution Des Versants, Proc Symp Int de Geomorphologie, Liege-Louvain, Belgium, June 8-16, 1966, Vol 40, p 111-122, 1967. 12 p, 3 fig, 2 photo, 7 ref.

Descriptors: *Geomorphology, *Slopes, *Slope stabilization, Sediments, Pleistocene epoch, Tertiary period, Erosion, Organic wastes, Soils, Climates, Topography, Plants, Animals, Geology, Runoff, Weathering, Mass wasting.
Identifiers: *Czechoslovakia, Slope development.

Quantitative research on the slope evolution in Czechoslovakia is reviewed. The research consisted of the following broad studies: evolution of the Pleistocene slopes based on the study of correlative deposits; evolution of slopes subjected to cultivation; and the study of slope processes using experimental stream basins. Pleistocene sediments preserved the Tertiary slopes and the thickness of these sediments gives definite data on the importance of the process of denudation. The presence of organic and inorganic material and the petrographic study of these sediments permits the identification of several stages of slope evolution. Data of slope evolution recorded at three experimental areas of central and western Czechoslovakia are included. (Gabriel-USGS)
W70-01289

CURRENT RIPPLES - THEIR RELATION TO PATTERNS OF WATER AND SEDIMENT MOTION,
Reading Univ. (England). Sedimentology Research Lab.
John R. L. Allen.
Amsterdam, North-Holland Publishing Co, 1968. 433 p, 443 fig, 15 tab, 538 ref.

Descriptors: *Deposition (Sediments), *Ripple marks, *Sedimentary structures, *Currents (Water), Sand waves, Flow nets, Flow separation, Dispersion, Sediment transport, Flow around objects, Eddies, Bed load, Sediment distribution, Shape, Laboratory tests.
Identifiers: *Reference book, *Current ripples, *Sediment motion, Cross-stratification.

A detailed description of the geometry and occurrence of ripple marks is given in this 19-chapter well written book based upon field and laboratory studies. Several aspects of current ripples are discussed: theory on fluid motion and sediment transport; description of bed forms, their surface anatomy and cross-stratification; fluid and grain motion associated with specific types of ripples; and sedimentation associated with current ripples. The author's analysis shows how streambed geometry and flow properties are related; many illustrations are given of novel fluid motions obtained. Experiments described show that many textural and geometrical properties of deposits can be understood in terms of diffusion and convection of sediments in areas of separated flow. This book gives the geologist and engineer an intellectual challenge and insight into patterns of water and sediment motion. (Lang-USGS)

A. Jahn.
Evolution Des Versants, Proc Symp de Geomorphologie, Liege-Louvain, Belgium, June 8-16, 1966, Vol 40, p 157-165, 1967. 9 p, 5 fig, 8 ref.

Descriptors: *Mass wasting, *Movement, *Slopes, *Cultivated lands, *Erosion, Runoff, Solifluction, Agricultural watersheds, Surface runoff, Washouts, Geology, Clays, Sands, Loess, Silts, River basins, Mass transfer, Soil physical properties, Soil erosion.
Identifiers: Soil mass movement in cultivated areas.

Soil movement on slopes induced by plowing, rain, and surface runoff was investigated by recording pertinent data in the upper Oder River basin of Poland with cultivated slopes of 3 to 18 degrees. Analysis of the process of selective erosion was based on the application of the formula developed by G. W. Musgrave (1947). Selective erosion is stronger on cultivated slopes and is present under natural conditions on the slopes of periglacial areas. On slopes of 10 deg, where plowing is parallel with contour lines, the thickness of the layer shifted annually as much as 10 cm. (Gabriel-USGS)

DEPOSITION IN THE PROCESS OF HYDRAULIC TRANSPORT,
R. A. Bagnold.
Sedimentology, Vol 10, No 1, p 45-56, Jan 1968. 12 p, 6 fig, 8 ref.

Descriptors: *Sedimentation, *Sediment transport, *Deposition (Sediments), Hydraulics, Turbulent flow, Bed load, Suspended load, Particle size, Particle shape, Turbulence, Tractive forces, Laboratory tests, Hydraulic models.
Identifiers: Sediment transport theory.

A simple theory is outlined, based on the conservation of energy, whereby such diverse processes as wind-blown and river-transported sediments, mudflows and sand avalanches can be brought together and explained in terms of the established concepts of general physics. It is shown that the mean rate of transport of sediment in turbulent suspension is determined by the whole size distribution of the transported sediment rather than by any arbitrarily defined mean size. This suggests that more detailed studies of the changes which occur in size distributions during the cycle of erosion transport and deposition would throw much-needed light on the underlying processes. (Knapp-USGS)

STATISTICAL MODELS IN SEDIMENTOLOGY,
Northwestern Univ., Evanston, Ill.
W. C. Krumbein.
Sedimentology, Vol 10, No 1, p 7-23, Jan 1968. 17 p, 4 fig, 4 tab, 27 ref.

Descriptors: *Statistical models, *Sedimentology, *Reviews, Sedimentation, Regression analysis, Stochastic processes, Computers, Mathematical models, Statistical methods, Systems analysis, Probability.
Identifiers: Sedimentological model studies, Statistical sedimentology.

Three stages of statistical development can be recognized in sedimentology. The first is descriptive statistics, in which the sample is the object of interest, and the second is analytical statistics, in which the population assumes major importance. A very large variety of statistical techniques is available for estimating mean values, degrees of variability, tests of differences among population means, linear relations (correlations) among the variables, and ways of evaluating areal variations (trends) in sedimentary phenomena. The third stage of statistical development is the application of stochastic process models to sedimentology, in which the objective is to discern the probabilistic elements is sedimentary processes, in part by simulation with the high-speed computer. Stochastic process models thus provide one way of examining sedimentary processes through time or over an area. In conjunction with deterministic models they provide a framework for exploring the underlying physical, chemical, and biological controls on sedimentary processes and deposits, with superimposed random fluctuations introduced by the 'built in' probabilistic mechanism. (Knapp-USGS)

ON ENVIRONMENT-SENSITIVE GRAIN-SIZE PARAMETERS,
Leiden Rijksuniversiteit (Netherlands). Dept. of Sedimentology.
W. S. Koldijk.
Sedimentology, Vol 10, No 1, p 57-69, Jan 1968. 13 p, 8 fig, 16 ref.

Descriptors: *Sediments, *Deposition (Sediments), *Particle size, *Statistical methods, *Computer programs, Sediment transport, Alluvial channels, Sampling, Settling velocity, Regime.
Identifiers: Sorting (Sediments), Moments (Statistical), Spain.

Moment measures are to be preferred over graphic measures for a reliable description of the depositional environment of sands. This is demonstrated by coarse beach and river sands from the Ria de Arosa (northwestern Spain). A PL/1 computer-program for the calculation of graphic and moment measures has been added to stimulate other comparative studies. (Knapp-USGS)
W70-01412

ANALYSIS OF THE RELATIONSHIP BETWEEN ACOUSTIC REFLECTIVITY AND SEDIMENT POROSITY,
Lafayette Coll., Easton, Pa. Dept. of Geology; and General Dynamics Corp., Groton, Conn. Electric Boat Div.
Richard W. Faas.
Geophysics, Vol 34, No 4, p 546-553, Aug 1969. 8 p, 6 fig, 4 tab, 13 ref. ONR Contract Nonr 2512 (00).

Descriptors: *Acoustics, *Porosity, *Sediments, *Physical properties, Mechanical properties, Sounding, Sound waves, Exploration, Geophysics, Clays, Sands, Gravels, Bottom sediments.
Identifiers: Acoustic reflectivity (Sediments).

Ocean-bottom sediment porosity and acoustic reflectivity are related by a simple linear equation. The equation was derived empirically from data published by several investigators and is valid for a wide variety of sediment types and ocean conditions. The degree of validity of the relationship appears to be excellent as the correlation coefficient between the porosity and acoustic reflectivity is 0.97. (Knapp-USGS)
W70-01428

INTER-ELEMENT ASSOCIATIONS IN SOME PELAGIC DEPOSITS,
Ottawa Univ. (Ontario). Dept. of Geology.
D. S. Cronan.
Chem Geol, Vol 5, No 2, p 99-106, Nov 1969. 8 p, 2 tab, 21 ref.

Descriptors: *Sediments, *Water chemistry, *Correlation analysis, *Trace elements, Spectroscopy, Chemical analysis, Manganese, Bottom sediments, Clays, X-ray diffraction, Mineralogy.
Identifiers: Pelagic sediment chemistry, Manganese nodules, Electron-probe analysis.

Calculation of correlation coefficients for various pairs of elements in pelagic deposits demonstrates the presence of several inter-element associations. In manganese nodules these are between Mn-Ni-Cu-Mo, Cr-detrital constituents, Co-Pb and Fe-Ti, and in pelagic sediments between V-Cr-Ti and Mn-Ni-Mo. These associations are considered to result largely from the partition of elements between the different mineral phases present in the deposits, and, in the case of the nodules, from variations in their depth of formation. (Knapp-USGS)
W70-01438

INFLUENCE OF CAPILLARY GROUND MOISTURE ON EOLIAN ACCUMULATION OF LOESS,
Wroclaw Univ. (Poland). Faculty of Geography.
J. Cegla.
Bull Acad Pol Sci, Ser Sci Geol et Geogr, Vol 17, No 1, p 25-27, 1969. 3 p, 10 ref.

Descriptors: *Capillary water, *Moisture, *Groundwater, *Loess, *Sedimentation, Geology, Topography, Vegetation, Cold regions, Deserts, Petrography, Aeolian soils.
Identifiers: *Poland, Loess accumulation processes.

In many parts of the world, loess deposits blanket uplands and elevated topographical elements. The presence of moisture in the ground may be of primary importance for the accumulation of loess on elevated topographical elements; however, this suggestion does not invalidate the widely accepted view that the climate conditions present during the accumulation of loess were cold and relatively dry. (Gabriel-USGS)
W70-01440

DEVELOPMENT OF EOLIAN TRANSVERSE RIPPLES AND RIPPLE BEDDING,
Polish Academy of Sciences, Warsaw. Museum of the Earth.
J. Muller.
Bull Acad Pol Sci, Ser Sci Geol et Geogr, Vol 17, No 1, p 49-56, 1969. 8 p, 4 fig, 18 ref.

Descriptors: *Sedimentary structures, *Aeolian soils, *Ripple marks, *Beds, Seashores, Beaches, Dunes, Hydrodynamics, Mathematical models, Mathematical studies, Stress analysis, Sediment transport.
Identifiers: Ripple mark development.

The conclusions reached during field work carried out mainly on beaches and coastal dunes of the Southern Baltic seashore, and in the laboratory using a simple wind tunnel are summarized. First-stage ripples may be interpreted as local dense concentrations of particles that move closest to the bottom. Development of the second-stage forms is connected with the interaction between the obstacles of the bed and the grainflux. Regular patterns of second- and third-stage ripples develop only in abundance of grains rolling and saltating and in stable conditions of flow. (Gabriel-USGS)
W70-01441

ACTIVATION ANALYSIS OF SEDIMENTARY ROCK,
Texas Petroleum Research Commission; and Texas A and M Univ., College Station.
E. M. Chandler, and Paul B. Crawford.
Bull Acad Pol Sci, Ser Sci Geol et Geogr, Vol 17, No 1, p 73-78, 1969. 6 p, 7 fig, 2 tab, 5 ref.

Descriptors: *Sedimentary rocks, *Sedimentary petrology, *Neutron activation analysis, *Analytical techniques, *Analysis, Thermal radiation, Chemical analysis, Silica, Sodium, Magnesium, Iron, Trace elements, Geology, Shales, Limestones, Sands.
Identifiers: Trace element analysis.

Sedimentary rock samples of shale, limestone, and sand were activated with thermal neutrons, allowed to cool and counted. Under certain conditions requiring no wet chemistry, the contents of Si, Al, Na, Mg, Hf, La, Sc and Fe in sedimentary rocks can be qualitatively determined. Sampling procedures and 10-second, one-minute, and 4-hour activation procedures are described. It is of interest that for a short activation time Si, Al, Mg, and Na peaks effectively mask out all trace elements. (Gabriel-USGS)

SILICA CONTENT AND SILICA-CLAY INTERACTIONS IN THE WATER OF THE DEAD SEA (ISRAEL),
Hebrew Univ., Jerusalem (Israel). Dept. of Geology.
Ora Amit.
Chem Geol, Vol 5, No 2, p 121-129, Nov 1969. 9 p, 4 fig, 4 tab, 7 ref.

Descriptors: *Water chemistry, *Brines, *Water analysis, *Silica, *Clays, Salinity, Saline water, Adsorption, Ion exchange, Mineralogy, Sorption.
Identifiers: *Dead Sea (Israel).

The concentration of silica in Dead Sea water ranges from about 13-17 ppm at the surface to about 8-10 ppm at depth. Contact with various clay minerals reduces the silica content of Dead Sea water to 2-3 ppm. These relations are the opposite of those obtained in ocean water: free ocean water has less than 1/10 the silica content of Dead Sea water, but oceanic interstitial water is about 10 times as rich in silica as the corresponding Dead Sea water. These differences are attributed to the uptake and release of silica by organisms in the ocean and their absence in the Dead Sea and to the influence of salinity on the solubility of clay minerals. (Knapp-USGS)

PROBABLE CHANGES IN THE COMPOSITION OF SEA WATER DURING THE COURSE OF GEOLOGICAL TIME,
Akademiya Nauk SSSR, Moscow. Institut Geokhimii i Analiticheskoi Khimii.
A. B. Ronov.
Sedimentology, Vol 10, No 1, p 25-43, Jan 1968. 19 p, 7 fig, 6 tab, 52 ref.

Descriptors: *Geochemistry, *Water chemistry, *Paleohydrology, *Sea water, Oxygen, Oxidation, Ions, Solutes, Aqueous solutions, Oxidation-reduction potential.
Identifiers: Sea water paleogeochemistry.

The geological history of the outer geospheres can be understood only if their chemical interrelationships are taken into account. The excess calcium and magnesium in sedimentary rocks cannot be understood unless the magmatogenous Azoic and Archean volcanic rocks were more mafic than the average composition of the Archean and Proterozoic shields. This leads to the idea that the cationic composition of the ancient ocean was essentially calcium and magnesium. The granitization of the sedimentary mantle in the Upper Archean and Lower Proterozoic was accompanied by the introduction of enormous amounts of alkaline solutions from the mantle into the crust, a growth in the volume of the ocean waters, the beginning of an inversion in the cationic composition and a gradual enrichment in sodium. This developed parallel with the growth of platforms and carbonate deposit formation. The formation of sulfate beds and thick beds of iron ore of the Early Proterozoic was preceded by the oxidation of sulfur and polyvalent metals. These processes were related to the history of carbon dioxide and oxygen in the atmosphere and to the development of life and the biosphere. Thus the Archean-Early Proterozoic boundary marks an epoch of abrupt change in the history of the outer zones of the earth. (Knapp-USGS)

SELECTIVE ELEMENT RECOVERY FROM OIL FIELD BRINES,
Kansas Univ., Lawrence. Dept. of Civil Engineering.
Ernest E. Angino.
Pap presented at 50th Annu Meeting of Amer Geophys Union, Wash, DC, Apr 21-25, 1969. 13 p, 5 fig, 1 tab.

Descriptors: *Desalination, *Oil fields, *Brines, Elements (Chemical), Sodium compounds, Sulfates, Sulfur, Trace elements, Iron.
Identifiers: *Element recovery, Oil field brines.

More than 250 billion gallons of oil-field brines are brought to the surface yearly in the United States. Most of these brines are wasted and/or are returned to the subsurface without any attempt of stripping the salts. In many instances, the salts in oil-field brines could be extracted profitably, if modern extraction techniques were used. Simple extraction processes for soda ash, sodium carbonate, caustic soda, magnesium and calcium sulfate, trace elements and others are available. Sulfur can be recovered by precipitating the sulfate as $BaSO_4$, which can then be made to yield S by a short 4-step conversion process. Magnesium can be precipitated as the hydroxide and selected trace elements can be scavenged by ferric iron precipitation. (Carstea-USGS)

NITRATE DETERMINATION IN SOIL EXTRACTS WITH THE NITRATE ELECTRODE,
Norges Landbrukshoegskole, Vollebekk. Inst. of Soil Science; and Norges Landbrukshoegskole, Vollebekk. Chemical Research Lab.
A. Oien, and A. R. Selmer-Olsen.
Analyst, Vol 94, No 1123, p 888-894, Oct 1969. 7 p, 5 tab, 23 ref.

Descriptors: *Analytical techniques, *Nitrates, *Soil water, *Aqueous solutions, *Electrodes, Electrochemistry, Ions, Zeta potential, Chemical reactions, Soil chemistry.
Identifiers: Nitrate determination electrodes.

Investigations were made on nitrate determination with a nitrate-specific ion electrode. Analytical results for the nitrate content in soil extracts are compared with analyses carried out by two colorimetric methods. The extracting agents used are 0.02 N copper sulphate, 2 N potassium chloride and distilled water. Results for nitrate determinations in soil suspensions and corresponding filtrates are also compared. The stability of soil extracts, the influence of variation in the ratio of grams of soil to millilitres of extracting agent and in the shaking time, interferences caused by ionic strength and anions, accuracy and reproducibility are also discussed. Nitrate determination with the electrode is reliable both for soil extracts and for soil suspensions. The determination is rapid, and the interferences are not serious. (Knapp-USGS)

CHEMICAL COMPOSITION OF ATMOSPHERIC PRECIPITATION IN SOME REGIONS OF THE USSR,
Nauchno Issledovatelskii Gidrokhimicheskii Institut, Novocherkassk (USSR).
A. A. Matveyev, and O. I. Bashmakova.
Translation from Gidrokhimicheskii Institut, Gidrokhimicheskiye Materialy, Vol 42, p 3-16, 1967. Soviet Hydrology: Selected Papers No 5, p 480-491, 1967. 6 fig, 4 tab, 35 ref.

Descriptors: *Precipitation (Atmospheric), *Water chemistry, *Water quality, *Salts, Chlorides, Sulfates, Bicarbonates, Calcium, Magnesium, Potassium, Sodium, Carbon dioxide, Hydrogen sulfide.
Identifiers: *USSR, *Atmospheric water chemistry, Sulfur dioxide.

The results of chemical analyses of atmospheric waters in the USSR are summarized. Maps are compiled on the average annual mineralization of atmospheric precipitation of salts with atmospheric precipitation per unit area. These maps show the magnitude of these quantities in various regions of the European USSR with an accuracy of about 15-45%. The concentration of marine salts in atmospheric precipitation varies from 60% of the total mineralization of precipitation in the north to 15% in the central part of the country. The influence of continental factors (eolian suspensions, industry, etc.) is strongest in the regions south of 50 deg N. (Carstea-USGS)

RARE AND DISPERSED ELEMENTS (MICROELEMENTS) IN THE WATER AND SUSPENDED SUBSTANCES OF RIVERS IN THE EUROPEAN USSR,
Nauchno Issledovatelskii Gidrokhimicheskii Institut, Novocherkassk (USSR).
G. S. Konovalov, A. A. Ivanova, and T. Kh. Kolesnikova.
Translation from Gidrokhimicheskii Institut, Gidrokhimicheskiye Materialy, Vol 42, p 94-111, 1967. Soviet Hydrology: Solected Papers No 5, p 520-533, 1967. 5 fig, 1 tab, 14 ref.

Descriptors: *Trace elements, *Elements (Chemicals), *Water chemistry, *Suspended load, Watersheds (Basins), Geomorphology, Water quality, Analytical techniques, Copper, Manganese, Cobalt, Dissolved solids.
Identifiers: *European USSR, Lead, Tin, Bismuth.

The contents of V, Mn, Co, Ni, Cu, Zn, Mo, Ag, Sn, Pb, and Bi in suspended and dissolved forms in the waters of the largest rivers in the European USSR depend on the chemical properties of the elements and the physiographic characteristics of river basins. No bismuth has been found in the water or in the suspended material. Lead, tin, silver, and cobalt were found only in suspended substances and only in some rivers. The other elements can be tentatively placed in the following order according to the increase in their dissolved form: V, Mn, Ni, Vn, and Cu. The ratios between the two main forms of the migration of microelements (in suspended substances and in dissolved form) differ considerably by river basin, especially if we compare the rivers of northern and southern basins and lowland and mountain rivers. Ni and Zn migrate not only with suspended substances, but also in dissolved form. (Carstea-USGS)
W70-01453

COMPOSITION OF ORGANIC SUBSTANCES IN FLOOD WATERS FORMING IN SMALL CATCHMENTS OF THE ARID ZONE,
Nauchno Issledovatelskii Gidrokhimicheskii Institut, Novocherkassk (USSR).
A. D. Semenov, L. I. Nemtseva, L. V. Brazhnikova, A. S. Demchenko, and A. P. Pashanova.
Translation from Gidrokhimicheskii Institut, Gidrokhimicheskiye Materialy, Vol 52, p 186-190, 1967. Soviet Hydrology: Selected Papers No 5, p 554-557, 1967. 1 tab, 11 ref.

Descriptors: *Water chemistry, *Small watersheds, *Organic compounds, *Floodwater, Watersheds (Basins), Arid climates, Precipitation (Atmospheric), Soils, Organic matter, Amino acids, Proteins, Nitrates, Nitrites, Ammonium compounds, Sulfates, Dissolved solids, Carbohydrates.
Identifiers: Soil extracts, Soil water chemistry, Sugars.

Atmospheric precipitation and the nature of soils determine the composition of organic compounds in floodwaters of small catchments. Water samples were tested for organic carbon, amino acids, proteins, free reducing sugars, complex carbohydrates, amines, organic acids, complex esters, nitrites, nitrates, ammonium, and sulfates. Snow water and adjacent soil extracts were also analyzed. During flood periods, the amount of dissolved solids in water approached the value found in soil extracts. The amount of dissolved substances was highest in the first day of flood. The content of ammonium ions was higher in the snow water and soil extracts than in the floodwaters. The influence of atmospheric waters is more pronounced in the formation of organic substances in floodwaters than in the formation of inorganic substances. (Carstea-USGS)
W70-01454

HYDROCHEMICAL MAPS OF THE RIVERS OF KAZAKHSTAN AND THEIR USE FOR THE RAPID FORECASTING OF THE MINERALIZATION AND ION COMPOSITION OF WATERS OF PROSPECTIVE RESERVOIRS,
Nauchno Issledovatelskii Gidrokhimicheskii Institut, Novocherkassk (USSR).
I. M. Pavelko, and M. N. Tarasov.
Translation from Gidrokhimicheskii Institut, Gidrokhimicheskiye Materialy, Vol 42, p 40-55, 1947. Soviet Hydrology: Selected Papers, No 5, p 495-508, 1967. 17 fig, 2 tab, 18 ref.

Descriptors: *Water management (Applied), *Water resources, *Water quality, Rivers, Forecasting, Ions, Water chemistry, Reservoirs, Maps.
Identifiers: *USSR, *Hydrochemical maps, Kazakhstan.

Maps of minimum, maximum, and weighted average mineralization of the water of rivers in Kazakhstan are compared. These maps, together with the relationships established between ion composition and mineralization, make it possible to judge the limiting values of the mineralization and chemical composition of the rivers of Kazakhstan in their annual cycle. A method is proposed which makes it possible, on the basis of the data obtained, to simplify the computations of the approximate mineralization and ion composition of waters of prospective reservoirs. (Carstea-USGS)
W70-01456

FORMATION AND STABILITY OF AL, FE, AND MG INTERLAYERS IN MONTMORILLONITE AND VERMICULITE,
Oregon State Univ., Corvallis.
Dumitru D. Carstea.
PhD Thesis, Oregon State Univ, June 1967. 117 p, 21 fig, 9 tab, 98 ref.

Descriptors: *Clay minerals, *Iron, *Aluminum, *Magnesium, *Analytical techniques, Montmorillonite, Mineralogy, Cation exchange, X-ray analysis, Acidity, Moisture uptake.
Identifiers: *Hydroxy-interlayers formation, Hydroxy-interlayers stability, Vermiculite.

The effects of pH and time on the formation of hydroxy-Al, Fe, and Mg interlayers were compared for montmorillonite and vermiculite. The stability of interlayers was evaluated by sequentially increasing the severity of dissolution treatments and by subjecting the interlayers to an HCl treatment. In montmorillonite, aluminum interlayers were formed at all pH levels. Systems equilibrated in acid media exhibited the greatest degree of interlayering. In vermiculite, aluminum interlayer formation was also greater for acid than for alkaline media. Changes after 6 months and one year were observed for both montmorillonite and vermiculite systems. Moderate amounts of iron interlayers were found in montmorillonite at all pH levels, whereas the alkaline environments favored their formation in vermiculite. Magnesium interlayers in montmorillonite and vermiculite were formed only in alkaline environments (pH greater than 10). The hydroxy-Al, Fe, and Mg interlayers in montmorillonite showed a higher degree of formation and exhibited a higher stability to sequential and HCl treatments than the interlayers formed in vermiculite.
W70-01457

FURTHER OBSERVATIONS OF HUMUS DECOMPOSITION AND NITRIFICATION,
East African Agriculture and Forestry Research Organisation, Kikuyu (Kenya).
H. F. Birch.
Plant and Soil, Vol 9, No 3, p 262-286, Sept 1959. 6 fig, 12 tab, 14 ref.

Descriptors: *Nitrification, *Decomposition, *Humus, Organic matter, Soil, Drying, Moisture, Soil chemistry, Nitrogen cycle, Nitrogen compounds, Gels, Soil surfaces, Boundaries (Surfaces), Cycling nutrients.
Identifiers: *Mineralization, Microbial activity, Organic gels, Solubilization, Surface effects, Microbial populations, Chemical processes.

After dry soil is moistened, a short period of rapid organic matter decomposition follows. Author investigated reasons for this phenomena and for mineralization of carbon and nitrogen during this period. Experimental evidence indicated that two processes of organic matter decomposition operate simultaneously: in one, only carbon mineralizes; in another both carbon and nitrogen mineralize. He shows that, after dry soil is moistened, considerable quantities of nitrogenous organic matter dissolve, and such solutions undergo rapid microbial decomposition, in which carbon mineralizes but nitrogen does not. Amounts of soluble organic matter were related directly to length of drying period. Concomitant nitrogen mineralization involves microbial decomposition of nonsoluble organic matter; rate of nitrogen mineralization is associated with surface area of organic gel in the soil. Author postulates that drying organic gels cause their fragmentation or increased porosity, leading to an increased surface area; moistening causes swelling and cohesion of gels, consequently decreasing their surface and eventually reducing rate of organic matter decomposition. Also, high rates of such decomposition following moistening of dry soil and rapid decline in decomposition rates may result from high microbial activity associated with youthful phases of developing microbial populations, followed by declining activity as such populations age. HYDROGRAPHY OF THE BALTIC DEEP BASINS III,
Fishery Board of Sweden.
Stig H. Fonselius.
Fish Board of Sweden, Ser Hydrogr, Rep No 23, 1969. 97 p, 65 fig, 4 tab, 106 ref.

Descriptors: *Hydrography, *Estuaries, *Sea water, Mapping, Topography, Water chemistry, Gaging stations, Chemical analysis, Stagnant water, Oxygen, Hydrogen, Phosphates, Salinity, Water temperature, Density, Runoff, Rivers, Silicates, Nutrients, Water balance.
Identifiers: Baltic basins.

This monograph is a comprehensive study of the hydrography of the Baltic Sea with an emphasis on the stagnation taking place in its deep water basins. Samples of Baltic water were taken from established stations periodically from the beginning of the century. Some characteristics of the Baltic topography produce two water layers separated by a permanent halocline which impedes the mixing of the water layers. The data recorded at various Baltic stations indicate a gradual increase in the salinity and phosphorus content and a decrease in oxygen content of deep waters. Meteorological factors, the decreased runoff of the Baltic area rivers, and the decreased water exchange through the Danish sounds coupled with the increased intensity of the bottom currents in the Belts and Kattegat are responsible for these changes in salinity, oxygen, and phosphorus contents. The implication of the findings is that if there is a continuation of the trends toward increased salinity and phosphorus concentration in the Baltic, the sea's deep water shall soon become devoid of organic life. A DEEP-SEA ELECTRICAL RESISTIVITY PROBE FOR MEASURING POROSITY AND DENSITY OF UNCONSOLIDATED SEDIMENTS,
SACLANT ASW Research Centre, La Spezia (Italy).
A. Kermabon, C. Gehin, and P. Blavier.
Geophysics, Vol 34, No 4, p 554-571, Aug 1969. 17 p, 16 fig, 9 ref.

Descriptors: *Electrical resistance, *Bottom sediments, *Instrumentation, Sediments, Oceanography, Electrical studies, Surveys, Exploration, Porosity, Density, Physical properties, Geophysics, Sampling.
Identifiers: Formation factor (Resistivity).

A study was made of the mass physical properties and electrical resistivity of marine sediments. The well-known linear correlation of density with porosity was confirmed. A third-degree polynomial curve was found to be the best fit for data relating porosity and the formation factor, which is the ratio of the bulk resistivity of marine sediments, to the resistivity of interstitial water. An electrical resistivity probe was devised to obtain in-situ profiles of resistivity versus depth. The instrument is 13 m long and weighs 700 kg in water. About 30 rapid measurements on the sea floor can be made in one lowering. Good correlation was obtained between electrical probe measurements and direct porosity measurements made on cores taken nearby. (Knapp-USGS)

ENERGY DISSIPATION IN A TIDAL ESTUARY,
Oregon State Univ., Corvallis. Dept. of Oceanography.
Jackson Blanton.
J Geophys Res, Vol 74, No 23, p 5460-5466, Oct 20, 1969. 7 p, 6 fig, 2 tab, 12 ref.

Descriptors: *Energy dissipation, *Tidal effects, *Estuaries, *Tidal energy, Oregon, Mapping, Water temperature, Salinity, Analysis, Mathematical studies, Water circulation, Energy transfer.
Identifiers: *Coos Bay (Ore), Tidal energy dissipation.

The extent and mechanism of the dissipation of tidal energy were investigated in Coos Bay, a coastal plain estuary located on the central Oregon coast. The study consisted in measuring and comparing the energy required to provide the observed mixing and an increase in potential energy with the energy lost through tidal damping. The measured dissipation rate in Coos Bay was 1/10,000 watt/kg. (Gabriel-USGS)

SEISMIC ATTENUATION OF GULF COAST SEDIMENTS,
Esso Production Research Co., Houston, Tex.
Frank N. Tullos, and Alton C. Reid.
Geophysics, Vol 34, No 4, p 516-528, Aug 1969. 13 p, 18 fig, 2 tab, 13 ref.

Descriptors: *Seismic studies, *Exploration, *Seismic properties, *Sediments, *Gulf Coastal Plain, Seismology, Stratigraphy, Data collections, Instrumentation, Systems analysis, Fourier analysis.
Identifiers: Seismic attenuation (Gulf Coast sediments).

Seismic attenuation values have now been obtained from normally layered Gulf Coast sediments. After normalizing with respect to the shot, the spectra of many traces over a small interval in depth can be averaged to minimize reflection interference and to yield a frequency response function associated with a given depth. Except for the measurements in the low velocity layer (LVL), a cemented array of geophones 1000 ft deep was used. The LVL measurements were made using individually cemented geophones. Data were taken on a digital recorder using a 0.5 ms sampling rate, and the processing was performed on a digital computer. Attenuation was found to vary exponentially with frequency to the first power in the range from 50 to 400 Hz. The 1000-ft section of earth, made up largely of clay and sand layers, was separated into 4 sections at depths of about 10, 100, and 500 ft. Attenuation in db/wavelength was found to be 13.1, 0.1508, 0.3641, and 0.2004 in the respective sections. (Knapp-USGS)

PHYSICAL PROPERTIES OF MARINE SEDIMENTS AS RELATED TO SEISMIC VELOCITIES,
Texas Instruments, Inc., Dallas.
Nabil Morgan.
Geophysics, Vol 34, No 4, p 529-545, Aug 1969. 17 p, 13 fig, 3 tab, 18 ref.

Descriptors: *Seismic studies, *Sediments, *Lake Erie, *Seismic properties, Density, Porosity, Particle size, Stratigraphy, Data collections, Statistical methods, Seismology.
Identifiers: Seismic velocity (Sediments).

An investigation of the dependence of seismic velocities on different physical properties of naturally occurring fresh-water sediments in Lake Erie has been conducted. Cores from one lake bottom were collected and the longitudinal seismic wave velocities as well as the physical properties (grain density, bulk density, porosity, median diameter, and phi deviation) were measured. The data were fitted with a second-order polynomial in all the physical properties to the seismic velocity. Independent variables were ranked according to their individual effect upon the sum of the squares of the regression residuals. A variance-analysis table was set up, and the coefficients were tested by a series of F ratios at certain probabilities. As porosity and bulk density are linearly related, these were not included together in the same model. There are strong indications that the porosity and its square together with the median diameter play a significant role in determining the seismic velocity at the probability of 0.90. At the higher probability of 0.99, the median diameter proved insignificant. The cubic term of porosity is insignificant at the 0.50 level. (Knapp-USGS)

03. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

FIRST VTE PILOT PLANT REPORT, JULY 1, 1967,
Oak Ridge National Lab., Tenn.
John W. Hill.
Available from the Superintendent of Documents, US Gov't Printing Office, Washington, DC, 20402, for $1.25 per copy. Office Saline Water Res and Develop Progr Rep No 367, 1968. 61 p, 18 fig, 2 tab, 2 ref, 3 append. Agreement No 14-01-0001-534.

Descriptors: *Pilot plants, *Desalination plants, *Evaporators, *Evaporation, Fresh water, Sodium chloride, Films, Heat transfer, Sea water, Research and development.
Identifiers: *Oak Ridge National Laboratory, Office of Saline Water, Wrightsville Beach (NC), Rising film, Falling film.

The Oak Ridge National Laboratory tested a pilot plant which could evaporate a maximum of 20,000 gallons of water per day. Both the rising-film and falling-film modes of operation using fresh water and sodium chloride solutions were tested. Evaporator tubes with enhanced surfaces improved heat transfer coefficients. The plant was sent to the Office of Saline Water East Coast Engineering and Development Test Station, Wrightsville Beach, North Carolina for further testing with sea water. Test results, the plant equipment and the proposed test plan are described. (Carstea-USGS)

A HYDRODYNAMIC THEORY OF DESALINATION BY ELECTRODIALYSIS,
Massachusetts Inst. of Tech., Cambridge. Dept. of Mechanical Engineering.
Ain A. Sonin, and Ronald F. Probstein.
Available from the Superintendent of Documents, US Gov't Printing Office, Washington, DC, 20402, for $0.60 per copy. Office Saline Water Res and Develop Progr Rep No 375, Dec 1968. 60 p, 15 fig, 11 ref. Grant No 14-01-0001-1721 (OSW).

Descriptors: *Desalination, *Electrodialysis, Analytical techniques, Membranes, Laminar flow, Model studies, Brines, Diffusion, Density currents, Polarity, Demineralization.
Identifiers: Hydrodynamic theory, Dialysate concentration.

A hydrodynamic theory of demineralization by electrodialysis has been developed for a multichannel system with steady laminar flow between plane, parallel membranes. The modeling of the system is found to be governed by 4 basic similarity parameters: (1) a dimensionless applied potential, (2) the product of the channel aspect ratio and the inverse Peclet number, (3) the ratio of brine and dialysate inlet concentrations, and (4) a parameter measuring membrane resistance. For sufficiently long channels it is shown that there are 2 distinct regions: a 'developing' region where the concentration diffusion layers are growing, and a 'developed' region where the diffusion layers fill the channel. Parabolic and uniform velocity profiles are considered and self-consistent solutions are derived for the distributions of salt concentration, electric field and current density in the system, as well as for the total current. In the limits of low and high polarization analytic solutions are obtained which when matched at their point of equality closely approximate the complete numerical solutions. (Carstea-USGS)
W70-01270

DESALTING OF SEAWATER BY FREEZING,
Cornell Univ., Ithaca, N.Y.
H. F. Wiegandt, P. Harriott, and J. P. Leinroth.

Available from the Superintendent of Documents, US Gov't Printing Office, Washington, DC, 20402, for $0.50 per copy. Office Saline Water Res and Develop Progr Rep No 376, Dec 1968. 43 p, 3 fig, 4 tab, 33 ref. Contract No 14-01-0001-1141.

Descriptors: *Desalination, *Desalination plants, *Freezing, *Sea water, Economics, Heat transfer, Brines, Condensation, Cost analysis, Water costs, Design.
Identifiers: *Secondary refrigerant freezing process, Butane, Multiple compressors.

The economics of the secondary refrigerant freezing process was evaluated with particular emphasis on large freezing plants. It was found that large economies resulted by using normal butane. The reasons for this are: (1) essentially all heat transfer is by direct contact of butane and water; (2) multiple compressors and module equipment are not required even at 50 mgd. Precooling the brine and condensing butane from the secondary compressor are additional contributing factors to the low water cost. A study of the secondary refrigerant freezing process using normal butane shows a water cost of 29 cents per 1000 gal for a single-train plant producing 50 mgd. The cost increases to 71 cents per 1000 gal for 5 mgd and to $1.76 per 1000 gal for 1 mgd, showing that the freezing process is most suitable for large rather than small or medium plants. (Carstea-USGS)
W70-01271

RESEARCH ON POROUS GLASS MEMBRANES FOR REVERSE OSMOSIS,
McDonnell Douglas Astronautics Co., Newport Beach, Calif.
F. E. Littman, and G. A. Guter.
Available from the Superintendent of Documents, US Gov't Printing Office, Washington, DC, 20402, for $0.50 per copy. Office Saline Water Res and Develop Progr Rep No 379, Dec 1968. 44 p, 16 fig, 10 tab, 4 ref. Contract No 14-01-0001-1282.

Descriptors: *Membranes, *Reverse osmosis, *Desalination, Ureas, Nitrates, Phenols, Brines, Temperature, Pressure, Acidity, Heat, Membrane processes.
Identifiers: Porous glass membranes.

The use of porous glass as membrane material for reverse osmosis has been explored in an experimental study using the glass in the form of tublets. Porous glass prepared in this laboratory gave sodium chloride rejections as high as 97% from a 10,000 ppm salt feed. The variables in the process of porous glass fabrication were investigated and correlated with the reverse osmosis properties of the product glass. It has been demonstrated that porous glass membranes can reject a wide variety of materials to about the same extent as sodium chloride. These materials are urea, phenol, nitrates, borates, and magnesium salts. The effects of heat and surface treatment of the glass were studied as well as membrane thickness, brine temperature, pressure, and pH. This study demonstrates that porous glass membranes show considerable potential for use in the reverse osmosis process as a hollow fiber material where adequate fluxes can be realized. (Carstea-USGS)

OPERATION OF A 50,000 GPD PORTABLE REVERSE OSMOSIS PILOT PLANT,
Aerojet-General Corp., El Monte, Calif.
E. R. Watson.
Avail from Superintendent of Doc, US Government Printing Office, Wash, DC, 20402 - Price $1.25. Office Saline Water Res and Develop Progr Rep No 430, May 1969. 63 p, 18 fig, 18 tab, 5 append. OSW Contract No 14-01-0001-930.

Descriptors: *Pilot plants, *Desalination plants, *Reverse osmosis, *Desalination, Membranes, Cellulose, Bacteria, Aqueous solutions, Chlorine, Research and development, Manganese.
Identifiers: *Cellulose acetate membrane, Formaldehyde.

Efforts were made to establish several major operational requirements for desalination pilot plants. Cellulose acetate membranes can be destroyed by certain types of bacteria, therefore, assembly must be done under sterile conditions. Treatment of the membrane stack assembly with about 2% aqueous solution of formaldehyde can prevent the bacterial damage. Manganese deposits form on the membrane surface when chlorine is used for bacterial protection. This precipitation occurred in water with a manganese content of 0.8-1.4 ppm. Stable operation of the pilot plant is feasible at an operating pressure as low as 450 psi. More research is needed to study the relationship between membrane size and pressure in order to achieve 50,000 gpd. (Carstea-USGS)

SEA WATER CORROSION TEST PROGRAM,
Dow Chemical Co., Freeport, Tex.
H. C. Behrens, F. D. Martin, O. Osborn, L. Rice, and W. B. Russell.
Avail from Superintendent of Doc, US Government Printing Office, Wash, DC, 20402 - Price $1.25. Office Saline Water Res and Develop Progr Rep No 417, Mar 1969. 107 p, 30 fig, 6 tab, 20 ref, 3 append. OSW Contract No 14-01-0001-1090.

Descriptors: *Sea water, *Corrosion, *Alloys, *Copper, *Desalination processes, Dissolved oxygen, Acidity, Velocity, Temperature, Deaeration, Turbulence, Brines, Hydrogen sulfide, Magnesium hydroxide, Calcium carbonate.
Identifiers: *Sea water corrosion, Deaerators, Water refreshment rate.

The weight losses of 6 copper alloys tested for corrosion resistance in sea water were measured under different conditions of dissolved oxygen concentration, pH, temperature, velocity and water refreshment rate. The corrosion rate seems to be very highly correlated with oxygen concentration. Extremely low weight loss was noted under low dissolved oxygen conditions (less than 5 ppb). For this reason, every effort should be made in desalination plants to provide feedwater deaerators to keep the levels of oxygen below 5 ppb. At low oxygen levels, water velocity, water turbulence and temperatures in the range of 180-250 deg F had minor or no effects upon corrosion rates. At low oxygen levels, the pH of the feedwater should be as high as possible without promoting precipitation of Mg hydroxide or Ca carbonate. The effect of hydrogen sulfide in the heated water can be nullified through controlled oxygen additions. The quantities of brine recirculated should be held to a minimum if the dissolved oxygen is low. Corrosion monitors should be installed at critical locations throughout a plant. (Carstea-USGS)

DEVELOPMENT OF LOW PRESSURE REVERSE OSMOSIS MEMBRANES AND DESIGN OF A SMALL UNIT FOR BRACKISH WATER,
Dartmouth Coll., Hanover, N.H.
John L. Brock, Peter M. Fahey, Christian S. Miller, and D. Dean Spatz.
Research supported by contract by Office of Saline Water. Office Saline Water Res and Develop Progr Rep No 441, June 1969. 273 p, 75 fig, 9 tab, 62 ref. OSW Contract No 14-01-0001-1644.

Descriptors: *Desalination plants, *Reverse osmosis, *Membranes, *Brackish water, *Desalination, Potable water, Cellulose, Electron microscopy, Analytical techniques, Permeability, Research and development, Pressure, Design.
Identifiers: *Reverse osmosis membranes, Porous cellulose acetate membranes, Polyester filter paper, Home desalination appliances.

A household appliance which produces 3 to 5 gallons per day of potable water from brackish water is described. Its operation is based on reverse osmosis and the water pressure present in the household water system in the only required power source. A pilot system that extrudes the basic Sourirajan-Loeb membrane solution onto a continuous sheet of tough polyester filter paper produces reverse osmosis membranes. The characteristics of porous cellulose acetate membranes are reported for brackish water feed for low pressure. Direct experimentation and electron microscopy were used to study the membrane structure. (Carstea-USGS)

DEVELOPMENT OF NEW REVERSE OSMOSIS MEMBRANES FOR DESALINATION,
North Star Research and Development Inst., Minneapolis, Minn.
L. T. Rozelle, J. E. Cadotte, R. D. Corneliussen, and E. E. Erickson.
Avail from Superintendent of Doc, US Government Printing Office, Wash, DC, 20402 - Price 45 cents. Office Saline Water Res and Develop Progr Rep No 359, Oct 1968. 59 p, 19 fig, 8 tab, 19 ref, 4 append. OSW Contract No 14-01-0001-1143.

Descriptors: *Desalination processes, *Membrane processes, *Reverse osmosis, Membranes, Cellulose, Films, Analytical techniques, Electron microscopy, Anisotropy, Desalination.
Identifiers: *Ultrathin membranes, *Anistropic membranes, *Support membranes, Beta-glucan acetate, Cellulose acetate.

Ultrathin membranes, anistropic membranes, and support membranes for reverse osmosis were studied. Ultrathin membranes of Beta-glucan acetate were as effective as cellulose acetate (CA) in reverse osmosis desalination. Beta-glucan acetate has shown promise as a new polymer for anisotropic membranes. A polysulfone film was developed that has a greater potential as a support film for ultrathin membranes than the cellulose acetate film. Also polysulfone is more inert chemically than CA. This is important if in situ chemical and replacement techniques for ultrathin membranes are to be developed. An interferometry method was developed for directly measuring the thicknesses of ultrathin membranes. Electron microscopy studies indicated that Beta-glucan acetate had a wavy surface structure, and that the surface of CA was smooth with isolated fibrils. (Carstea-USGS)

THERMOPHYSICAL PROPERTIES OF SALINE WATER,
Monsanto Research Corp., Everett, Mass. Boston Labs.
Alexander Korosi, and Bela M. Fabuss.

Avail from Superintendent of Doc, US Government Printing Office, Wash, DC, 20402 - Price $0.45, Office Saline Water Res and Develop Progr Rep No 363, Sept 1968, 53 p, 8 fig, 20 tab, 44 ref. OSW Contract No 14-01-0001-466.

Descriptors: *Thermal properties, *Physical properties, *Saline water, Thermodynamics, Thermal conductivity, Viscometers, Sea water, Sodium chloride, Instrumentation, Viscosity, Density, Potassium compounds, Sodium sulfate, Magnesium compounds, Temperatures, Electrolytes, Aqueous solutions.
Identifiers: Binary electrolyte systems, Ternary electrolyte systems, Multicomponent electrolyte systems, Glass capillary viscometers.

Thermal conductivity was measured in water, NaCl and sea water solutions in the temperature range of 25-150 deg C, using transient rather than steady state methods. The molalities of NaCl solutions were 0.7 and 3.5, and the solute concentration in the synthetic sea water corresponded to the ionic strength value of normal and three-fold concentrated sea water. Experimental viscosity and density measurements were made on electrolyte solutions containing one or two of the major sea water components, NaCl, KCl, sodium sulfate and Mg sulfate, dissolved in water. The viscosity of liquid water from 75 deg to 150 deg C was measured in a special glass capillary viscometer pressurized with hydrogen. The experimental results on binary, ternary and multicomponent electrolyte systems were correlated using Othmer's rule which establishes a linear relationship between the logarithm of viscosity of an aqueous solution and that of water at the same temperature. (Carstea-USGS)

NEUTRON INELASTIC SCATTERING STUDIES OF WATER AND IONIC SOLUTIONS,
Union Carbide Corp., Tuxedo, N.Y.
G J Safford, P S Leung, and P C Schaffer.
Avail from Superintendent of Doc, US Government Printing Office, Wash, DC, 20402. Office Saline Water Res and Develop Progr Rep No 372, Aug 1968, 69 p, 16 fig, 4 tab, 82 ref, 2 append. OSW Contract No 14-01-0001-372.

Descriptors: *Analytical techniques, *Water, *Aqueous solutions, Water properties, Salts, Hydrates, Ions, Molecular structure, Bonding, Desalination.
Identifiers: *Neutron inelastic scattering, Diffusion coefficient, Solid salt hydrates.

Slow neutron inelastic scattering was used to measure the intermolecular frequencies between 900 cm and 8 cm of water molecules in pure water and in aqueous solutions of La chloride, Ca chloride, Mg chloride, CsI, CsCl, KSCN, KI, KBr, KCl, KF, NaCl, Li nitrate and LiCl. The diffusion coefficients of water molecules in various aqueous solutions were also determined. Small or highly charged ions break existing water structure and form complexes with scattering bonds similar to those of water molecules in the corresponding solid salt hydrates. Salt solutions with larger charged ions also show new scattering bonds which, at lower temperatures, are broader and less pronounced than for smaller or highly charged ions. (Carstea-USGS)

ENERGY AS A FACTOR OF PLANNING IN THE FIELD OF SEA WATER DESALINATION INGENIEURGESELLSCHAFT FICHTNER, STUTTGART-FEUERBACH, GERMANY,
W. Fichtner.
Proc Intern Symp Water Desalination, 1st, 1965, Washington 3, 445-52 (1967). 2 fig. Paper No SWD 105.
Identifiers: *Energy costs, *Energy sources, Dual-purpose plant, Flash evaporation, Fossil fuels, Nuclear energy sources.

Emphasis is on the dual-purpose plant utilizing the multistage flash distillation method and energy supplied by steam power stations. A comparison of fossil fuel-fired plants vs nuclear-powered plants indicates that small desalination plants should utilize fossil fuel, whereas large plants should use nuclear power. Plant size should not solely determine the type of heat generation mechanism to be used. Other factors such as the relations between fuel heat costs and power selling costs, as well as alterations expected during the operating time of a plant should be taken into consideration. Characteristics of dual-purpose seawater distillation plants are given, as is a comparison of the economics of a nuclear power plant and a fossil fuel-fired plant for seawater distillation (17C MGD).

ORGANIC-COOLED HEAVY-WATER-MODERATED REACTORS – AN APPROACH TO LARGE-SCALE DUAL-PURPOSE PLANTS,
Atomics International, Canoga Park, Calif.
C Starr, S Golan, and D V Graf
Water Production Using Nuclear Energy, Ed by R G Post and R L Seale, p 253-72, 1966. 9 fig, 4 ref. Univ Arizona Press, Tucson. Proc Am Nucl Soc Symp, Mar 1966.
Identifiers: *Energy sources, *Heavy-water/organic-cooled reactors, *Nuclear energy sources, Converter reactors, Dual-purpose plant economics, Economic evaluations, Multistage flash distillation, Plant layout, Water costs estimate, 250 plus MGD plant.

Current light-water reactors are generally more attractive as energy sources than fossil plants in large plant sizes and low fuel cost nuclear heat sources such as the heavy-water reactor and fast breeder are of special interest for future large power and desalting applications. The HWOCR is particularly suitable because of a unique combination of design and operating characteristics. A layout is given for A 1-BGD, 3400-MWE (net) dual purpose plant that will utilize two 8250-MWT HWOCR units in parallel. Plant economics, performance characteristics, and a plant availability analysis are included. The steam developed by the nuclear heat source will power five 800-MWE back-pressure turbines exhausting steam at 25 PSIA to the brine heaters of ten 100-MGD multistage-flash evaporators. The total investment for such a plant is estimated at $1.05 billion. If the power can be sold at 2.0 mills/KWH, the product water cost will be about 13 cents/1000 gal.

NUCLEAR REACTORS FOR SEA-WATER DESALINATION,
Iowa State Univ., Ames.

Presented at Am Soc Mech Engr Meeting, New York, Nov 27-Dec 1, 1966. Paper 66-WA-NE-21.
Identifiers: Applications of nuclear energy, Boiling-water reactors, Breeder reactors, Converter reactors, Dual-purpose plant, Economic evaluations, Energy costs, Pressurized-water reactors, Single-purpose plant, Water costs estimate.

Primarily on the basis of nuclear reactor principles and technology, current and near term converters and long range breeders for seawater desalination are analyzed. The trends of current and near term converters and the full utilization of uranium and thorium energy resources in developing fast and thermal breeders are discussed. Comparisons of single-purpose and multipurpose nuclear desalting plants from economic and technological considerations are also given. Water cost and steam cost are estimated for single-purpose and dual-purpose (with electric power credit of 3.65 mills/KWH) desalting plants at various reactor sizes up to 2400 MWT. Water costs were estimated to be about 30 cents/1000 gal for dual-purpose plants with 1600 MWT or larger reactors. Process steam from this size reactor was estimated at 30 cents/MBTU for a dual-purpose plant or 48 cents/MBTU for a single-purpose plant.

THE OPTIMAL DESIGN OF DESALINATION SYSTEMS,
Kansas State Univ., Manhattan.
L. T. Fan, C. Y. Cheng, L. E. Erickson, and C. L. Hwang.
2nd European Symp Fresh Water from Sea, Vol 4, Athens, May 1967. Desalination 3, 225-36, 1967. 14 fig, 17 ref.

Descriptors: *Economic evaluations, Design, Membrane processes, Flash distillation, Osmosis, Water costs estimate.
Identifiers: Multiple effect distillation.

Process analysis and optimization studies have been made for a multi-effect multistage flash distillation system and a multistage reverse osmosis system. In the distillation system, the heat supplied to the brine heater, the brine reject concentration, the recirculation rates within each effect, and the allocation of brine temperature and composition among the effects are controlled to arrive at an optimal policy. In the reverse osmosis process, multistage operation is compared with single-stage operation. The recirculation rates in each stage, the allocation of brine composition among the stages and the operating pressures in each stage are controlled to arrive at the optimal operating condition. A flow-work exchanger is incorporated into the reverse osmosis system and its quantitative advantages are examined under optimal conditions. A discrete form of the maximum principle in combination with other optimization techniques has been used for most of the optimization studies.

ECONOMIC EVALUATION OF DESALTING SUB-SYSTEM AS A PART OF THE TOTAL WATER SYSTEM,
California Univ., Los Angeles.
J. M. English, and N. El-Ramly.
Desalination 3, 308-17 (1967). 5 fig, 4 ref. Also preprints 2nd European Symp Fresh Water From Sea, Vol 4, Athens, May 1967.

Descriptors: *Economic evaluations, *Feasibility studies, Capital costs, Cost allocation, Water utilization.

Engineering and economic feasibility studies of projected desalination plants have been confined to single developments. The cost of desalted water is

compared with that of alternative supplies. A higher unit cost for water from a desalination plant as compared with other sources could be justified. The economics of desalination is considered from the viewpoint of the total water system of which the conversion plant may be only a component. The concept of limited planning horizon is discussed, and the water system is synthesized in relation to the long-term demand function. The alternative of a mix between the surface water collection systems and desalination is introduced. The optimum mix is determined on the basis of minimizing the present worth of costs in relation to demand. Through the use of continuous discounting (interest) and exponential approximations for the demand functions, the effects of the rate of return and rate of growth in demand on the optimum plant characteristics are shown in a direct, simple manner. With respect to individual water supplies, capital cost is allocated over the life of the plant in proportion to the demand pattern, and an equivalent marginal water pricing concept is formulated. This price is then minimized, and optimum life, investment and capacity are thereby determined.

SELECTION OF PARAMETERS OF AN ATOMIC ENERGY PLANT WITH HIGH PRODUCTIVITY DISTILLATION OF SEA WATER,
Gosudarstvennyi Komitet po Ispolzovaniyu Atomnoi Energii SSSR, Moscow.
L. S. Sterman, N. A. Mozharov, and V. V. Gubenko.
Desalination 5, 95-106 (1968). 5 fig, 4 ref. Also preprints 2nd European Symp Fresh Water From Sea, Vol 4, Athens, May 1967.

Descriptors: Capital costs, Dual-purpose plant, *Economic evaluations, *Nuclear desalination, Operating costs.
Identifiers: Pressurized-water reactors, 0-3000 MW (T) reactors.

Based on thermal economics, capital investment, and operational charges, the optimum parameters and power of an atomic power plant are selected. The method given for techno-economic analysis of nuclear energy plants of the PWR type generating electrical and heat energy allows one to choose the initial steam parameters at the turbine entrance, under different exhaust pressures. Techno-economic calculations for nuclear dual-purpose plants with reactor capacities of 760 MW (T) and coolant pressures in the first circuit equal to 100 ATM show that, for the same generation of electrical energy, minimum expenditures on heat given to the desalination plant correspond to a coolant temperature at the entrance to the reactor of 220 deg C with an exhaust pressure of 2 ATM. Increase in the thermal flux in the active zone (achieved by decreasing the marginal coefficient) leads to a marked decrease in specific calculated charges.

DUAL-PURPOSE NUCLEAR POWER AND DESALTING PLANTS,
Bechtel Corp., Los Angeles, Calif.
W. H. Wilson.
Water Production Using Nuclear Energy (Ed by R G Post and R L Seale), p 369-82, Univ. Arizona Press, Tucson (1966). 5 fig. (Proc Am Nucl Soc Symp, Mar 1966, Tucson).
Identifiers: *Dual-purpose plant economics, *Metropolitan water district, *Multistage flash distillation, *Siting surveys, Capitalized costs, Conceptual designs, Dual-purpose plant, Economic evaluations, Flash evaporation, Nuclear desalination, Water costs estimate, 51-250 MGD plant.

Background for and description of a 150-MGD, 1,600 MW (Net) dual-purpose plant to be used as a supplementary source of water and power for the metropolitan water district of southern California. A multi-stage flash distillation process was found most suitable, with a conceptual design consisting of three parallel 50-MGD plants. The cost of water was calculated for the desalting plants with top brine temperatures of 195-250 deg F, with the lowest cost water produced at a top brine temperature of 250 deg F. Capital costs for the dual-purpose plant, based on October 1965 wage and price levels, is $133,100,000, for the Bolsa Island site. A cost comparison between fossil- and nuclear-fueled plants shows that, based on an annual use of 75% natural gas and 25% fuel oil, at a cost of about 35 cents/mbtu desalted water from a fossil-fueled plant would cost 25% more to produce than that from a nuclear-fueled plant. The cost of water at the desalting plant was 21.9 cents/1000 gallons, with an extra five cents required to transport the water to the Diemer Filtration plant.

GUIDELINE FOR UNIFORM PRESENTATION OF DESALTING COST ESTIMATES.
Parsons (Ralph M.) Co., Los Angeles, Calif.

OSW R and D Progr rept no 264 (July 1967). 49 p, 3 fig.

Descriptors: *Economic evaluations, *Operating costs, *Water costs estimate, Capital costs, Cost allocation, Direct costs, Fixed costs, Indirect costs.

Guidelines and formats for computing and uniformly presenting estimated costs of desalted water by any process are provided. The method of cost centers has been selected for application to the economic analysis of desalting plants so that attention may be readily focused on basic elements of the complete plant. The costs are categorized into capital cost centers, recurring cost centers, and O and M cost centers. Examples of the format and a general outline for a report presenting the results of an economic analysis are given. Guidelines for preparation of the capital cost estimate meet the following objectives completeness, current costs, simplicity and uniformity of presentation, ease of evaluation and analysis, segregation of process equipment from site and service facilities, and adaptability to various methods of cost allocation in multipurpose plants. Each item to be included in the capital cost estimate is discussed in detail. To determine the cost of water, annual fixed and O and M costs are estimated to be the uniform average for the life of the plant. Each item in these cost categories is discussed separately. The cost of water is influenced by the method of desalting, the relation of the plant to its surroundings and other economic factors.

NUCLEAR DESALTING - FUTURE TRENDS, AND TODAYS COSTS,
Applied Research and Engineering Ltd., Durham (England).
R. Starmer, and F. Lowes.
Chem Eng 75 (19), 127-34 (1968). 9 fig, 9 ref.

Descriptors: *Flash distillation, *Reviews, Energy, Nuclear desalination, Nuclear energy, Water costs.

The total installed capacity of MSF plants throughout the world is rapidly increasing and should reach over 90 MGD by 1970. A target is for 1-BGD plants in 1980-90 producing water at 10-15 cents/1000 gal. The most important cost component of an MSF evaporator is the condenser tubing. Tubes of the longest practical length should be used (the limit appears to be 105 ft due to transportation difficulties). Optimizing evaporator performance depends greatly on the cost of steam. Large capacity plants offer a significant saving in capital cost per unit of product - about 40% saving would be expected when increasing the plant size from 5 to 50 MGD. Economics favor fossil fuels over nuclear for dual-purpose plants up to about 200 MGD. However, in special areas where fossil fuels are very cheap (say 5 cents/mbtu) they would have an advantage at even higher capacities. Reactor systems are being advanced and operating conditions improved. However, the largest single factor in reducing reactor cost is an increase in the size of the reactor unit. The trend must be toward a fast-breeder reactor system.

BRIDGING THE DESIGN-FABRICATION GAP IN THE CONSTRUCTION OF MAMMOTH DESALTING PLANTS,
Chicago Bridge and Iron Co., Ill.
A. N. Chirico, and T. R. Livingstone.
Proc Intern Symp Water Desalination, 1st, 1965, Washington 3, 773-87 (1967). 2 fig, 6 tab.

Descriptors: *Economic evaluations, Reviews, Water costs.
Identifiers: 0-50 MGD plant, 51-250 MGD plant.

There is no design-fabrication gap. Seawater can be converted to fresh water with present knowledge. There are 3 basic reasons why construction of large desalination plants is not occurring at an accelerated rate consistent with the needs (1) fear of obsolescence, (2) psychological cost barriers, and (3) apprehensiveness in size extrapolation. However, it is doubtful that the cost of desalted water can be reduced to less than 50 cents/1000 gal in 50-MGD plants within the next 20 years. A dual-purpose plant may lower water costs to 30 cents/1000 gal if the cost of fuel is not prohibitive. For this reason, nuclear fuel sources are now being considered for large conversion plants. There are tremendous capital and operating economies which reduce the cost of water drastically when dual-purpose technology is utilized. The only hope of reducing water cost to a level making it both commercially and domestically acceptable would be in integrating the production of power and water. It is obvious that procedures must be established to clearly differentiate and designate the responsibilities of government, designer-constructors, architect-engineers, utility companies, and the consumer.

A REPRESENTATIVE DESIGN OF NUCLEAR POWER/DESALTING PLANTS NOW AVAILABLE,
General Electric Co., San Jose, Calif; and Chicago Bridge and Iron Co., Oak Brook, Ill.
F. E. Crever, D. C. Maxwell, A. N. Chirico, and T. R. Livingstone.
Paper presented at Nuclex-66 Meeting, Basel, Switzerland, Sept 8-14, 1966. 51 p, 7 fig.

Descriptors: Brine heater leakage, Control systems, Cost allocation, Design, Water costs.
Identifiers0-3000 MW (T) reactors, 0-50 MGD plant, *Conceptual design, Brine heater leakage.

This report covers a conceptual design study of a nuclear dual-purpose electrical power-MSF distillation plant based on current technology. Design details normal to present-day reactors and water plants are not discussed. The plant capacity is 50 MGD and 300 MWE saleable. The heat source is a 1300 MWT BWR. Many design, control, and cost features peculiar to the dual-purpose concept are considered in detail. These features include water plant and brine heater construction, control of the brine heater pressure levels and the overall plant, and cost allocation between the power and water plants. Product water cost is estimated to be about 30 cents/1000 gal. The report includes detailed cost estimates, a computer printout of the water plant optimization study, a plant layout drawing, and a flow diagram including the reactor plant. An unusual feature is a discussion and analysis of brine heater leakage problems. This section includes a tabulation by isotope of the radioactive constituents in typical BWR condensate.

QUESTIONS OF SEA WATER DESALINATION PLANT DESIGN,
W. Fichtner.
Presented at 2nd European Symp Fresh Water From Sea, Vol 4, Athens, May 1967. Desalination 3, 252-58 (1967). 4 fig.

Identifiers: *Dual-purpose plant economics, *Economic evaluations, Boiling-water reactors, Coupling (Reactor-desalting plant), Fossil fuels, Fuel costs, Nuclear desalination, Product ratio, Water costs estimate, 0-50 MGD plant.

A comparison is presented of product ratio and water cost for full backpressure 50-MGD dual-purpose desalination plants with light water nuclear power stations (approximately 65 ATM saturated steam) vs fossil-fueled power stations (approximately 180 ATM 540/540 deg C). The seawater maximum temperature is 110 deg C (230 deg F). The specific heat consumption (performance ratio) of the desalination plant is varied from 40 to 120 mcal/cu.m. The power cost is determined by assuming a market value for power of 5.0 to 7.5 mills/kwhr. The results show that the product ratio (kwh/cu.m.) for the nuclear power station is approximately 60% that of the fossil fuel power station under equivalent conditions. Also, for nuclear fuel costs of 0.70 $/gcal and fossil fuel costs of 1.50 $/gcal the product water costs are approximately equivalent. Results are presented for fossil fuel costs of 1.25, 15.0 and 1.75 $/gcal.

U.S.-MEXICO-IAEA STUDY OF LARGE NUCLEAR POWER AND WATER DESALTING PLANTS FOR SOUTHWEST UNITED STATES AND NORTHERN MEXICO,
Office of Saline Water, Washington, D.C.
J. A. Hunter.
Paper SM-113/38 presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 20 p, 10 fig.
Identifiers: *Dual-purpose plant, *Feasibility study, *Mexico, *Southwest United States, Agriculture, Capitalized costs, Economic evaluations, Energy sources, Liquid-metal fast-breeder reactors, Multistage flash distillation, Nuclear desalination, Nuclear energy sources, OSW sponsored, Siting surveys, Vertical tube evaporators, Water costs estimate, Water utilization, 3000 plus MW (T) reactors.

Results of a study by a joint IAEA-U.S.-Mexico team to determine the technical and economic practicability of a dual-purpose nuclear-powered plant to supply water and power for the region comprising the southwest U.S. and Northern Mexico. The team determined that a plant sufficient to meet 1980 water needs should be of 1 bgd capacity with two light water reactors of 5000 MW (T) each, producing 2000 MW of electricity. Advanced plant technology assumed for 1990 includes use of liquid metal fast breeder reactors and vertical tube evaporators coupled with multistage flash for brine heating. Capital and annual cost data were developed for three possible sites - Tiito, San Luis, and Santa Clara areas, using interest rates of 4%, 6%, 8%, and 10%, with 30-year life assumed for dual-purpose plant and 50-year life for civil works associated with water conveyance and power transmission. For 1980 plant, water costs range from 16 to 40 cents/1000 gal, with power costs from 1.8 mills to 3.1 mills/kwhr. For 1990 plant, water cost estimates range from 9 to 31 cents/1000 gal, while power costs vary from 1.1 mills/kwhr at 4% fixed charge range to about 2.5 mills/kwhr at 10% fixed charge rate.
W70-01539

NUCLEAR POWER AND WATER DESALTING PLANTS FOR SOUTHWEST UNITED STATES AND NORTHWEST MEXICO.
International Atomic Energy Agency, Vienna (Austria).

Report TID-24767 (Sept 1968). 377 p, 83 tab, 69 fig.
Identifiers: *Dual-purpose plant, *Feasibility study, *Mexico, *Southwest United States, Agriculture, Capitalized costs, Economic evaluations, Energy sources, Liquid-metal fast-breeder reactors, Multistage flash distillation, Nuclear desalination, Nuclear energy sources, Siting surveys, Vertical tube evaporators, Water costs estimate, Water utilization, 3000 plus MW (T) reactors.

A preliminary assessment conducted by a joint United States, Mexico, and IAEA study team. The team concluded that dual-purpose nuclear plants are a technically feasible method of supplying freshwater and electricity to the states of Mexico and U.S. that border the lower Colorado River. Such plants could provide the required quantities of water and could enhance the quality of water in the region. The initial plant studied produce 1 bgd of water and 1700 mwe saleable power. Based on 1966-67 prices, the project would cost from $8,500,000 to $1 billion as the fixed charge rate changes from 4% to 10%. Water costs at the distribution center would vary from 15.5 to 33 cents/1000 gal for the lowest cost location depending upon fixed charge rates to 17 to 40 cents/1000 gal for the greatest cost location. Electricity costs would vary from 1.8 mills/kwh at 4% fcr 3.1 mills/kwh at 10% fcr. The preliminary economic assessment leads the study team to recommend that further detailed studies be conducted to firmly establish the economic practicability of such plants. Summary is available as report TID-24681.

TRENDS IN DESALINATION.

Nucl Eng 13, 854-58 (1968). 12 fig, 3 tab.

Descriptors: *Nuclear desalination, *Reviews, Distillation processes, Dual-purpose plant economics, Energy costs, Energy sources, Water costs estimate.

A short review of 13 different methods being used or considered for the provision of fresh water supplies from salt or brackish water together with a survey of lines of development, project proposals, and cost studies. From a review of various cost studies it would appear that a nuclear-powered dual-purpose desalting plant would produce the lowest cost water. Calculated costs range from 24 to 54 cents/1000 gal of product water.
W70-01541

WATER DESALTING COST - PRESENT AND FUTURE,
International Atomic Energy Agency, Vienna (Austria).
D. B. Brice.
In Isotope and Radiation Techniques in Soil Physics and Irrigation Studies, p 403-21, (Proc Symp, Istanbul, June 12-16, 1967), Intern At Energy Agency, Vienna (1967). 6 fig, 11 ref.
Identifiers: *Distillation processes, *Nuclear energy sources, *Water costs estimate, Breeder reactors, Dual-purpose plant, Dual-purpose plant economics, Economic evaluations, Energy sources, Multistage flash distillation, Nuclear desalination, Reviews, Vertical tube evaporators.

Some of the more promising processes for desalting, such as multistage flash distillation and long tube vertical evaporation, are described. Electrodialysis is normally used for brackish water. A MSF plant requires a thermal energy input of 50,000 or more kcal/cu.m. A substantial reduction in the cost of water would be realized if an inexpensive source of energy such as nuclear energy were available. By the end of 1966 nuclear reactors in operation had a total capacity of 9000 MW (E). This should increase to 35,000 MW (E) by 1970 and 100,000 MW (E) by 1975. Improvements are expected to bring the cost of steam 18 cents/mbtu by mid-1970s, to 12-15 cents with advanced converters in the late 1970s and to 6-10 cents with breeder reactors by the early 1980s. Scale formation limits the temperature usable in a MSF plant, whereas electric power costs are lowest when steam is produced at high temperatures. Thus the advantage in dual-purpose plants. The water-to-power ratio in dual-purpose plants is limited at present to 0.8-0.8 mgd/MW (E), depending on the type of reactor. Projected water cost estimates are as low as 23 cents/1000 gal and further into the future perhaps 11 cents/1000 gal.

FACTORS INVOLVED IN THE ECONOMIC PRODUCTION OF USABLE FRESH WATER FROM SALINE SOURCES,
Powell (Sheppard T.) and Associates, Baltimore, Md.
S. T. Powell.
Proc Intern Symp Water Desalination, 1st, 1965, Washington 3, 429-44 (1967). 4 fig, 5 tab. (Paper SWD/100).
Identifiers: *Economic evaluations, *Waste disposal, Brine system designs, By-product economics, Corrosion, Corrosion control, Fixed costs.

Removal of oil detergents, insecticides, miscellaneous organic compounds (the most serious contaminants in coastal waters), and saline supplies which contain iron (above 0.5 ppm) will raise the cost of the finished water. The use of steel pipe in saline well construction (design life of well 20 yrs) is being considered because of its availability, initial cost, and the ease of construction. However, steel well castings equipped with slotted screens have a limited life in brackish formations (as low as 2 yrs in some instances). This rapid deterioration has been due to screen plugging and general fouling by corrosion from the water or from the corrosive properties of the formation in which wells have been located. Corrosion can be minimized by using insulating couplings (nonmetallic castings). Brine disposal (20,000 tons per day for a system of 150-MGD capacity) is very costly for inland plants but is not considered a major cost problem for coastal sites. It does create a thermal pollution problem. Total costs for brine disposal for plants (15 to 50 MGD) vary from 1.8 to 3.2 million dollars, depending on plant size. Water costs may be less if magnesium, bromine, fluoride or other products can be converted from the brine disposal.

COASTAL DESERTS - PRIME CUSTOMERS OF DESALINATION,
International Geographical Union, Wayland, Mass.
P. Meigs.
Proc Intern Symp Water Desalination, 1st, 1965, Washington 3, 721-36 (1967). 2 fig, 1 tab, 11 ref. (Paper SWD/85).
Identifiers: *Site selection criteria, *Water utilization, Agriculture, Geography.

Much of the information given is from a study entitled the geography of coastal deserts (Paris, UNESCO). Methods of heat generation discussed are solar radiation and oil deposit utilization for small desalination plants. Advantages of coastal desalination plants are (1) availability of unlimited supplies of seawater which can be pumped to the desalination plant at less cost than inland brackish or saline water, (2) convenient discharge of residual brine directly into the ocean, (3) cheap ocean transportation of equipment and fuel, and (4) food provided from the seawater.

MINERAL BY-PRODUCTS FROM THE SEA,
Grace (W. R.) and Co., Clarksville, Md.
M. L. Salutsky, M. G. Dunseth, and O. B. Waters, Jr.
OSW R and D Progr Rept No 91, PB-181 588 (1964). 130 p, 17 fig, 81 tab, 27 ref.
Identifiers: *By-product manufacturing processes, *Chemical by-products, *Feedwater treatment, *Fertilizer, By-product economics, Chemical production, Ion exchanging, Removal from feedwater, Calcium, Scale prevention.

Experimental investigations were carried out toward the recovery of potassium, calcium, magnesium boron, and other elements from seawater. Means for significantly improving the recovery of potassium were found. However, at the present state of development a potassium fertilizer from this source would cost 2 to 3 times more than from conventional sources. The best method found for the removal of calcium was a modification of classical lime-soda process. This would remove up to 90% of the calcium from seawater at a cost of

out 18.8 cents/1000 gal. In other studies it was und that a slurry of superphosphate fertilizer in awater can be converted to a solution of sodium osphate by continuous ion exchange, that the mmonia requirements in a descaling process could en be reduced by about one-third, and that the osphate recovery from a continuous ion change contactor is 97-99%. Three methods ere explored for the recovery of boron from sea-ater, distillation as trimethyl borate, coprecipita-n with magnesium hydroxide, and adsorption on eformed magnesium hydroxide. The latter two ethods may be valuable for the recovery of boron ecause of their simplicity. Two methods were ex-ored for the concentration of a mixture of metal-c elements, concentration on magnesium am-onium phosphate and adsorption on magnesium ydroxide.

A CLOSED-CYCLE PROCESS FOR PREVENT-NG SCALE FORMATION IN EVAPORATORS ND PRODUCING INDUSTRIAL CHEMICALS T A NUCLEAR DESALINATION PLANT,
Oak Ridge National Lab., Tenn.
. E. Blanco, W. C. Yee, W. E. Clark, J. M. Holmes, and R. Salmon.
Report ORNL-4057 (Sep 1967). 51 p, 12 fig, 42 ef.
dentifiers: *Chemical production, *Feedwater reatment, *Fertilizer, *Scale prevention, lowsheets, Multipurpose plant, Scaling.

Caustic and sodium carbonate are added to sea-ater to precipitate greater than 95% of the calci-m as calcium carbonate at ph 9.2. After removal f the precipitate, the ph is decreased to 7 by ad-ing hydrochloric acid to permit evaporation (to a x concentration) at 350 to 400 deg F without cale formation. Caustic, chlorine, and hydrogen re produced from concentrated seawater in a con-entional industrial electrolytic cell. The calcium arbonate is calcined to produce sodium carbonate or further descaling. Hydrochloric acid for ph ad-ustment is produced by the combination of 6% of he hydrogen and chlorine. An optional feature is he production of fertilzier either (1) by combining lectrolytic hydrogen and nitrogen from air iquefaction to produce ammonia or (2) by com-ining this ammonia with excess carbon dioxide rom calcined calcium carbonate to produce urea. An economic evaluation based on the production of 1 bgd of fresh water showed that a private company could detain revenue from the sale of excess chlorine and hydrogen and could provide the descaling service for a fee of 1 cent/1000 gal.

RECOVERY OF SALTS FROM SALINE WATERS VIA SOLVENT EXTRACTION,
Dow Chemical Co., Walnut Creek, Calif.
R. R. Grinstead, and J. C. Davis.
OSW R and D Progr Rept No 320, Jan 1968. 118 p, 28 fig, 45 ref.
Identifiers: *Chemical by-products, *Feedwater treatment, *Waste disposal, By-product manufacturing processes, Chemical production, Experimental data, OSW sponsored, Removal from feedwater, Magnesium, Solvent extraction.

The results of a study of the chemistry of mixed ionic extractant systems and their possible application to the recovery of by-products from desalination brines. In water-toluene systems, amines exhibit a wide spread in apparent base strength, which has been shown to be mainly a result of differences in tendency of the amine salts to aggregate in toluene. The order of increasing extraction of simple inorganic anions by these systems is nitrate, bromide, chloride, bicarbonate. Extraction studies are reported with mixed ionic systems, consisting of alkylammonium carboxylates, which extract both components of an inorganic salt. The same order of preference for anions is observed as for amines alone. The order of decreasing extraction of cations is calcium, magnesium, sodium, potassium.

MINERALS FROM SEA SALT,
Yale Univ., New Haven, Conn.
J. A. Tallmade, J. B. Butt, and J. S. Herman.
Ind Eng Chem 56 (7), 44-65, 1964. 3 fig, 332 ref.
Identifiers: *By-product economics, *Chemical by-products, Bibliographies, By-product manufacturing processes, Chemical production, Fertilizer, Literature surveys, Reviews, Seawater chemical analysis.

A comprehensive review and evaluation of methods of recovering minerals from the large quantities of concentrated brines and salt mixtures resulting from desalination. Such recovery is a possible means of income to reduce the cost of fresh water from a desalting system. Specific processes are classified as those pertaining to recovery of halogens, major metals (Sodium, Magnesium, Calcium, and Potassium), and minor and trace elements. Processes are also designated as to whether mixed salts or multiple products are involved. All the elements are present in some measure in the salts from the sea. Some 39 presently considered worth recovering range from chlorine with a concentration of 18,980 ppm to gold at 0.000006 ppm. Separation methods reviewed include precipitation, electrolysis, electrodialysis, adsorption, ion exchange, chelation, oxidation, chlorination, solvent extraction, and solar evaporation.
W70-01553

THE SEA AS A SOURCE OF DISSOLVED CHEMICALS,
Dow Chemical Co., Freeport, Tex.
W. F. McIlhenny, and D. A. Ballard.
In selected papers on desalination and ocean technology, ed by SN Levine, Dover Pub, Inc, New York, 1968. p 1-15, 2 tab, 35 ref. Also preprint AM Chem Soc Meeting, Los Angeles, Apr 1963.
Identifiers: *By-product economics, *Chemical by-products, By-product manufacturing processes, Chemical production, Literature surveys, Reviews, Seawater chemical analysis.

From the dissolved salts (166 million tons/cu mi) in seawater, only common salt, sodium and potassium compounds, calcium and magnesium compounds, magnesium metal, and bromine have been produced in commercial quantities. In search of profitable methods of producing other minerals and metals, Dow studied a hypothetical factory processing 2 million acre-ft of seawater annually. Some 50 dissolved chemicals ranging in amounts from 54 million tons of sodium to less than 0.02 tons of gold would pass through the factory each year. Annual operating costs of $12 million derived for a chemical separation plant alone (or $3 million for a plant operating in conjunction with a saline water conversion plant) proved prohibitive. It was concluded that production of not one of the 35 elements below the concentration of those presently produced commercially, or any combination of them, would be profitable. Many elements (iron, copper, aluminum, zinc, lead, tin, nickel, manganese, and mercury) greatly diluted in seawater are concentrated several hundredfold or thousandfold by various species of marine plants or animals. Improvement of technology of culturing, nurturing, and harvesting these marine organisms may present a solution. Use of ion exchange beds, ionic membranes, and selective electrodialysis may prove profitable.

AGRICULTURAL WATER BY NUCLEAR DESALINATION AND TECHNICAL ROUTES TO ITS ACHIEVEMENT,
Oak Ridge National Lab., Tenn.
R. P. Hammond.
Water Production Using Nuclear Energy, Univ Arizona Press, Tucson. (Proc AM Nuclear Soc Symp). Ed. by R. G. Post and R. L. Sealey, p 337-58, Mar 1966. 7 fig, 11 ref.
Identifiers: *Agriculture, *Water utilization, Economic evaluations, Nuclear desalination, Reviews, Water costs estimate.

An analysis is made of cost components of large-scale seawater desalting to show where we stand using presently available reactors and evaporator technology and the areas where improvements must be made to achieve various levels of agricultural water cost. Water at $65/acre-foot is within reach of present technology, but no large-scale agricultural use is anticipated until the price can be brought down to the $45-$30 range. Solution of this problem requires (1) development of one or more approaches to a single-purpose plant (or one producing only a little power), (2) rapid development of low-cost, high-performance evaporators, (3) development of nuclear reactors which can supply energy at much lower cost than present reactors, and (4) experimental and prototype plants which can be scaled up to sizes far larger than would ever be needed for city water sources.

PROGRESS ON THE DESIGN OF MULTIFLASH EVAPORATORS,
Weir Westgarth Ltd., Glasgow (Scotland).
J. M. Stewart, and W. R. Querns.
Desalination 3, 139-46, 1967. 4 fig. Presented at 2nd European Symp Fresh Water from Sea, Vol 8, Athens, May 1967.
Identifiers: *Multistage flash distillation, *Reviews, Component designs, Component development, Design, Evaporators, Layout, Product water purity.

Recent progress in the design of multiflash evaporators is outlined with particular reference to improvements in performance and efficient use of materials. Cost reduction and efficiency are expected to advance gradually through development of existing ideas, rather than because of any sudden major breakthrough. One possibility to be guarded against is that, because of keen worldwide competition, designers might resort to cost cutting

procedures detrimental to both customer and the science. Also discussed are the chemical problems of desalting by flash evaporators. Solutions are examined, with possible avenues for additional study suggested. As part of a large experimental program in the United Kingdom, Weir Westgarth Ltd. in association with the Ukaea has built at troon on the Ayrshire coast of Scotland a large research and development station which will accommodate very large modules for brine flow tests, as well as smaller, more sophisticated plants for corrosion and scale prevention tests. The multiflash system is expected to be the leading method of desalination until at least 1980-85.

3B. Water Yield Improvement

POTABLE WATER EXTRACTED FROM THE AIR - REPORT ON LABORATORY EXPERIMENTS,
Royal Inst. of Tech., Stockholm (Sweden). Dept. of Hydraulics.
B. Hellstrom.
J Hydrol, Vol 9, No 1, p 1-19, Sept 1969. 19 p, 12 fig, 1 tab, 2 ref.

Descriptors: *Water supply, *Condensation, *Air conditioning, *Humidity, *Separation techniques, Water vapor, Condensers, Thermodynamics.
Identifiers: Water extraction (Humid air).

Experiments to extract water from the air were carried out in the laboratory by means of a commercial air-conditioning plant (dehumidifying unit). Air was drawn through the unit by a fan, and the amount of water produced was collected, measured, and analyzed. The feasibility of this method was fully proved by the experiments. The extracted water might be expensive, but the method is intended as an alternative in those places where water is very costly or only very small quantities are required. (Knapp-USGS)

Descriptors: *Cloud seeding, *Evaluation, *Washington, Statistical methods, Forecasting, Streamflow forecasting, Regression analysis, Least squares method.
Identifiers: Cloud seeding evaluation, Skagit River (Wash).

During the winters of 1962-63 and 1963-64 cloud-seeding operations were undertaken on the Skagit River (Washington) watershed. Conditions required that the statistical evaluation be made at the streamflow control level. A combination of least squares regression with principal components analysis is developed. This requires preliminary screening of variables using a liberal (0.01 level of significance) critical region, followed by the orthogonalization procedure of principal components. Final stepwise regression analysis using the principal component scores and the 0.05 level of significance follows. Tests are consistent with treating the residuals as Gaussian, homoscedastic, and non-autocorrelated. The analysis is replicated in various ways. Without exception, the excess of actual over predicted flows for the full period of the experiment was significant at 0.01 'or higher' level. However, whereas the excess in 1964 is invariably significant at the 0.005 'or higher' level, the 1963 excess would not be judged significant by itself at the 0.05 level. This is explained by a five-fold increase in seeding between 1963 and 1964. Two years subsequent to the period of seeding are analyzed: observed flows fail to show significant deviations from expected flows. Estimates indicate at least 15% runoff increase from seeding. COMBINED WEATHER AND VEGETATION MODIFICATION PROMISES SYNERGISTIC STREAMFLOW RESPONSE,
Washington State Univ., Pullman. Coll. of Agriculture.
Donald R. Satterlund.
J Hydrol, Vol 9, No 2, p 155-166, Oct 1969. 12 p, 2 tab, 15 ref.

Descriptors: *Cloud seeding, *Watershed management, *Water yield improvement, Rainfall-runoff relationships, Evapotranspiration, Runoff, Hydrogeology, Water yield.
Identifiers: Synergistic effects.

The potential effect of simultaneous application of cloud seeding and vegetation modification of target watersheds was tested using Thornthwaite water balance models. Combining practices often produces a synergistic interaction that increases runoff from treated woodland watersheds over the sum of the two practices applied separately. The synergistic gain appeared in 29 of 30 tests, using climatic data from wooded areas of the United States. Increased runoff attributable to synergistic interaction ranged from 0 to 43 mm annually, with quantities exceeding 25 mm annually appearing commonly from wooded regions of the dry Southwest. The validity of the tests and significance of the results are discussed, with the conclusion that water-short nations cannot afford to overlook this potential for increasing their water supply. WATER COST IN DEVELOPING COUNTRIES,
J. Barnea.
Proc Intern Symp Water Desalination, 1st, 1965, Washington 3, 737-52 (1967). 5 ref.
Identifiers: *Water costs estimate, *Water utilization, Siting surveys.

Surveys by UN experts show that the bulk of water consumed in developing countries is used for irrigated agriculture. Normally, groundwater is cheaper than desalinated water, and nonagricultural sectors of an economy can afford higher water costs. Blending and mixing of desalinated water with brackish water can improve the quality of the brackish water, increase the quantity of water, and, in effect, reduce the cost of the desalinated water. A UN survey shows that in Madras State (India) the use of 1000 imperial gallons of water for rice cultivation yields a gross agricultural income of $0.05. Construction of a dam will provide water in the Manabi province of Ecuador on the Portoviejo River for $0.011/1000 gal, on the Calceta River for $0.03/1000 gal. The average costs of groundwater are given as being from $0.01 to $0.10/1000 gal.

A CONCEPTUAL NUCLEAR ENERGY CENTER FOR THE CO-PRODUCTION OF AGRICULTURAL CHEMICALS AND DESALTED WATER TO SERVE A PILOT FOOD FACTORY,
Department of the Interior, Washington, D.C.
S. A. Bresler, and E. F. Miller.
Preprint SM-113/24 of Paper Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 18 p, 8 fig, 7 ref.
Identifiers: *Agriculture, *Economic evaluations, *Water utilization, Capitalized costs, Chemical by-products, Chemical production, Conceptual designs, Cost breakdowns, Electrochemonuclear systems, Energy costs, Feasibility study, Multipurpose plant, Agro-industrial complexes.

Results of a study of a thermodynamically balanced water-ammonia complex. A flowsheet is presented with charts summarizing the preliminary cost estimates and unit costs for each primary product as determined by the available energy method of cost allocation given in IAEA tech. rept. ser. no. 80. Outlined is a method of adjusting the flowsheet to larger scaled operations, i.e., in giant food factories, to achieve a better ammonia-agricultural water balance through the addition of facilities for the parallel production of steam, electric power and synthetic motor fuel. High pressure steam or electric power could be used to increase the production of water by utilizing a vapor compression recycle in conjunction with a multistage flash plant. Additional electric power could be used on site for the production of phosphoric acid and mixed fertilizers. Conclusions are that it would be feasible to construct and operate a pilot food facto-

y of the kind described using presently available uclear and chemical engineering technology.

DESALTING SALINE IRRIGATION WATER SUPPLIES FOR AGRICULTURE - A CASE STUDY, LOWER COLORADO RIVER BASIN, U.S.A.,
Bureau of Reclamation, Denver Colo.; and Office of Saline Water, Washington, D.C.
. T. Maletic, E. S. Krous, and M. S. Sach.
Preprint SM-113/37 of paper presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 18 p, 12 ref.
dentifiers: *Agriculture, *Land utilization, *Multistage flash distillation, *Water utilization, Electrodialysis process, Feedwater treatment.

A case study involving 10,570 irrigable acres near Yuma, Arizona, was performed to evaluate potential applications of multistage flash distillation (MSF) and electrodialysis (ED) processes to desalting water for agriculture. Costs and benefits of desalting water at concentrations of 2600 and 5330 ppm to concentrations of 1500, 900, and 400 ppm were determined. Benefits result from shifts to more profitable cropping patterns, increasing crop yields, reducing water use, reducing costs for water application and drainage, and increasing the flow of farm products from the project. Costs are based on project features such as desalting plants and steam generating equipment, raw water collection facilities, storage reservoirs, conveyance and distribution system, brine disposal system, blending facilities (MSF only), Gypsum addition system (ED only), and water treatment facilities. Benefit-cost ratios based on yield projections to year 1990 were negligible with water of 5330 ppm desalted to 1500 ppm, but this increases to 1.62 with desalting to the 400 ppm level. Benefit-cost ratios varied from negligible at 1500 ppm to 1.72 at 400 ppm when the feedwater source was 2600 ppm. Investment costs were high, ranging from $5000 to $8200/acre. Desalting is expected to be important in the future of agriculture, but competition with other water development possibilities will be involved.

NUCLEAR ENERGY CENTERS - INDUSTRIAL AND AGRO-INDUSTRIAL COMPLEXES,
Oak Ridge National Lab., Tenn.
J. W. Michel.
Preprint SM-113/32 of Paper Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 37 p, 21 ref, 13 fig.
dentifiers: *Agriculture, *Agro-industrial complexes, Breeder reactors, Cost breakdowns, Economic evaluations, Energy costs, Energy sources, Evaporators, Nuclear energy sources, Water utilization.

Results of a 1967 study at ORNL to determine the technical and economic feasibility of nuclear-powered industrial and agro-industrial complexes. Basic information was developed on the cost of producing industrial products requiring significant amounts of electricity and of producing a variety of basic food corps. The general economics of combining a nuclear-electric generating station, an industrial complex, and a large agricultural enterprise into an agro-industrial complex was evaluated for both near-term and far-term technologies for the nuclear desalting plant. The effects on the economic return of size, changes in product mix and sales price levels, and of operation with bypass steam to reduce the generation of electricity were also determined. Five typical coastal desert locales in India, Sinai, Baja, California, Peru, and western Australia were briefly examined to test the adaptability of this concept to real world conditions.

3F. Conservation in Agriculture

SALT BALANCE AND CRITICAL DEPTHS OF GROUND WATERS OF THE PART OF THE VAKH VALLEY UNDER IRRIGATION FOR MANY YEARS (RUSSIAN),
Yu. G. Planin.
Izvestiya Akad Nauk, Tadzhik, SSR, Otdeleniye Fiziko-Matematicheskikh i Geologo-Khimicheskikh Nauk, No 2 (28), p 83-95, 1968. 9 tab, 7 ref.

Descriptors: *Irrigation, *Salt balance, *Leaching, *River basins, Salinity, Infiltration, Precipitation (Atmospheric), Irrigation effects, Reclamation, Water quality, Geology, Drainage, Water source, Water chemistry, Calcium, Sodium, Magnesium, Sulfates, Temperature, Humidity, Vegetation, Evapotranspiration.
Identifiers: *USSR, Vakh River irrigated basin.

The principles of reclamation of long-term irrigated lands were investigated on the basis of hydrologic, geologic, and atmospheric data recorded in a selected 156-ga-area of the Vakh basin, USSR, 1960 to 1963. Loss of salt is associated with drainage waters and this loss exceeds the amount of salt brought by irrigation waters. Chloride, sodium and magnesium sulfate are the most actively leached elements. The smallest loss is shown by gypsum and calcium carbonates. The cause of both positive and negative salt exchange is poor stability of the salt regime. In general, a zone of relatively active salt exchange must be not less than 15 to 20 inches thick. Empirical formulas were used for the determination of critical depths. (Gabriel-USGS)

AUTOMATION OF SURFACE IRRIGATION SYSTEMS,
Agricultural Research Service, Fort Collins, Colo. Soil and Water Conservation Research Div.
Howard R. Haise, and E. Gordon Kruse.
'Automation of Irrigation and Drainage Systems.' Proceedings National Irrigation and Drainage Spec Conf, ASCE, Phoenix, Ariz p 175-200, Nov 13-16, 1968. 13 fig, 9 ref.

Descriptors: *Surface irrigation, *Turnout gates, *Laterals, Automatic control, Water distribution.
Identifiers: *Fluidic diverters, *Water-powered cylinders, *Center pivot gates, Float valves.

Two systems for automating surface irrigation are described. One uses pneumatic valves remotely controlled by tone telemetry to open and close turnouts at timed intervals. The other uses water-powered cylinders activated by float valves to operate center pivot gates. Large fluidic diverters have also been evaluated for irrigation applications. The automation components can be adapted to furrow, border dike, and basin irrigated fields supplied by open ditches or buried pipelines. Several field systems have been installed and evaluated.

AUTOMATION OF SURFACE IRRIGATION WITH FLUIDIC DIVERTERS,
Agricultural Research Service, Fort Collins, Colo. Soil and Water Conservation Research Div.
E. G. Kruse, P. A. Freeman, and H. R. Haise.
Presented at annual meeting of the ASAE, Purdue Univ, Lafayette, Ind, June 22-25, 1969; to be published in Trans of the ASAE.

Descriptors: *Electronic sensing, *Control components, *Mechanical gate structures, Siphons.
Identifiers: *Fluidic technology, *Fluidic diverters, *Throat dimensions, *Controlled fluid, Bowles Engr'g Corp, Distribution structures.

Fluidic technology has been developed within the past 10 years. Fluidic devices control the flow of fluids using no moving parts and often utilize the energy of the flowing fluid as a source of power for control of the devices. Fluidic devices are easily interfaced with mechanical or electronic components of a control system. In irrigation applications, a large fluidic element can be used to divert the irrigation stream from conveyance to distribution structures and back, using either fluid or electronic sensing and control components. In other applications, smaller fluidic elements may perform the control function, with the weight or pressure of the controlled fluid being used to actuate mechanical gate structures. Experimental fluidic diverters developed by the Bowles Engineering Corp., Silver Springs, Md., with throat dimensions ranging from 1/4 x 1/4 inch up to 8 x 8 inches appeared to have application in automation of surface irrigation systems. This paper describes the results of a cooperative study, laboratory and field, to evaluate feasibility of utilizing large or small fluidic diverters to switch irrigation streams directly or in conjunction with mechanical gates or siphons.

THE PRODUCTION OF AMMONIUM NITRATE FERTILIZER BY USING LOW-COST ENERGY FROM A NUCLEAR DESALINATION REACTOR,
Oak Ridge National Lab., Tenn.
J. M. Holmes, R. Salmon, R. E. Blanco, and J. W. Ullmann.
Report ORNL-TM-2202 (Apr 30, 1968). 20 p, 4 fig, 31 ref.
Identifiers: *Chemical production, *Multipurpose plant, By-product economics, By-product manufacturing processes, Chemical by-products, Energy sources, Fertilizer, Flowsheets.

The cost of producing ammonium nitrate was estimated and compared with that for the conventional steam-methane process. Hydrogen was produced by the electrolysis of water with advanced-type cells and power costs varying from 1 to 3 mills/kwhr. Nitric acid, ammonia, and ammonium nitrate were produced with the hydrogen by conventional methods. The capital cost of the nitric acid plant was reduced by about 8% by using oxygen from the electrolysis plant instead of air. Nitrogen for the ammonia plant was recovered from the nitric acid tail gas. The results showed that ammonium nitrate produced in a 698-ton/day plant using power at 1.6 mills/kwhr could compete with the product from a conventional reforming plant using 31 cent/mbtu natural gas. If oxygen credit is allowed, electrolysis would compete with plants using 20 cents/mbtu natural gas. At larger plant sizes, the comparison is less favorable to the electrolytic process, because of its poorer scaling factor. At 2330 tons/day of ammonium nitrate, 1.6 mills/kwhr electricity competes with 34.5 cents natural gas, assuming no oxygen credit. The

average U.S. industrial gas price in 1963 was about 34 cents/mbtu.

TECHNOLOGY NEEDED FOR THE ECONOMIC USE OF DESALTED WATER IN AGRICULTURE,
Oak Ridge National Lab., Tenn.
R. P. Hammond, and T. D. Anderson.
Preprint SM-113/27 of paper presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 12 p, 2 fig.
Identifiers: *Agriculture, *Water utilization, Agro-industrial complexes, Breeder reactors, Economic evaluations, Energy costs, Energy sources, Evaporators, Heat transfer improvements, Nuclear energy sources.

A summary of the present economic position of desalting in agriculture and of technological developments of nuclear reactors, desalting plants, and crop production which are necessary to improve this position, for reactors, two important factors will affect future energy costs - the advent of very large units and the arrival of advanced breeders. The economic consequences and probable timing of each of these are discussed. For seawater evaporation equipment, the importance of enhanced heat transfer surface and large size plants on economics is emphasized, and recent developments in this direction are summarized. In agricultural technology, controlled production conditions may be expected to provide an environment in which new inputs of crop breeding, nutrient control, and efficient water application may result in outputs per unit of water used far beyond present productions.

PROCEDURES FOR ESTIMATING IRRIGATION WATER REQUIREMENTS,
Bureau of Reclamation, Denver, Colo.
Don Robb.
Preprint of Papers Presented at Intern Hydrol Symp, Sept 1967, Fort Collins, Colo. 8 p, 2 fig, 5 ref.
Identifiers: *Agriculture, *Water utilization, Agronomy, Ground water recharge, Soil structure.

Part of a study to develop better procedures for estimating the various factors which comprise the total irrigation water requirement - crop consumptive use, effective precipitation, distribution losses, surface runoff, and deep percolation. Preliminary data show that the most common cause of lower than optimum irrigation efficiencies, after differences of soil type, slope, and climate have been eliminated, is lack of sufficient information on the part of the irrigator about when to apply water and how much to put on. Farm efficiencies have a great effect on water projects. For example, a change from 50% to 60% farm irrigation efficiency would result in a 17% reduction in water requirement for the area or a 20% increase in the area which sould be served. This does not take into account any downstream reuse of return flow, but it points out that in some areas improved efficience of use of present water supplies may be more attractive in terms of costs and benefits than development of new supplies.
W70-01562

FACTORS AFFECTING THE ABILITY OF AGRICULTURE TO PAY IRRIGATION-WATER COSTS,
Food and Agriculture Organization of the United Nations, Rome (Italy).
M. A. Hagood.
In Isotope and Radiation Techniques in Soil Physics and Irrigation Studies, p 423-7, (Proc Symp, Istanbul, June 12-16, 1967), Intern at Energy Agency, Vienna 1967. 6 fig, 11 ref.
Identifiers: *Agriculture, *Water utilization, Land utilization, Water costs estimate.

There are no universally acceptable standard criteria for determining how much agriculture can pay for irrigation water. Justification of cost will depend upon the countrys need to develop its soil and water resources for food, for international trade, and for its cumulative effect on other industries in comparison with other possible uses and their overall contributions to the economy. Social and political conditions often have as much or more influence on development cost decisions than do strictly economic analyses. Many studies indicate that 10 cents/1000 gal is an upper limit of acceptable costs for developing irrigation water at present economic levels. Under private development and on projects where water users must pay total water costs, methods are available for making feasibility budgets based on present prices. Because of inflation, world food shortage, recessions, future population and other unknown factors, it is hazardous to predict how much farmers or agriculture can pay for irrigation water. Better utilization of water available now offers opportunities for developing sources at costs much less than those for sources such as seawater conversion.

GEOPHYSICAL STUDIES OF WATER LEAKAGES FROM RESERVOIRS,
Moscow State Univ. (USSR). Dept. of Geology.
A. A. Ogilvy, M. A. Ayed, and V. A. Bogoslovsky.
Pap presented at 13th Meeting of European Ass of Explor Geophysicists, Salzburg, June 1968. Geophysical Prospecting, Vol 17, No 1, p 36-62, Mar 1969. 27 p, 10 fig, 7 ref.

Descriptors: *Water loss, *Reservoir leakage, *Geophysics, Ice, Boreholes, Electrical equipment, Sands, Electrolytes, Water temperature, Resistivity, Currents (Water), Filtration, Dams, Damsites, Mathematical studies, Porosity, Electrical studies.
Identifiers: *USSR, Armenia, Uzbekistan.

Because geophysical methods offer good prospects for the indentification of leakage from water reservoirs, laboratory studies and observations at reservoir sites located in Armenia and Uzbekistan, USSR, were conducted. The electrical prospecting method for leakage detection is based on the possibility of using natural currents which form electric fields in passing through porous media. Observations at reservoir sites were made by moving non-polarizable potential electrodes and water velocity measuring devices. The combination of natural

current method and benthonic flow rate measurements is effective in determining water leakage from reservoirs. In some cases it is useful to supplement these methods by temperature measurements within the whole reservoir profile. (Gabriel-USGS)

Study and Report in Support of Legislation Concerning Harmful Alterations in, Uses of, and Activities in Connection with Watercourses and Lakes, p 8-9, p 33-38, (A Revision of Preliminary Report of Feb 1, 1967), Feb 28, 1967.

Descriptors: *Alteration of flow, *Riparian rights, *Reasonable use, *Indirect benefits, Natural flow doctrine, Riparian land, Water rights, Competing uses, Relative rights, Benefits, Public benefits, Prior appropriation, Legal aspects, Riparian land.
Identifiers: Non-riparian benefits, Harmful use.

Proposed section 429-1 would allow a riparian owner who has the privilege of effecting a harmful alteration of a waterbody under section k to affect the alteration to further the use of non-riparian land instead, as long as it was no more harmful than for the use of riparian land. This section would aid in the optimum development of land and water resources, while protecting the rights of co-riparians. This addition is needed to counter the common law rule that any use on non-riparian land that is harmful to riparians is unlawful. Constitutional attacks suggesting that the section destroys the cause of action a riparian has against a non-riparian user are not substantial since the harm would be limited to that allowed for riparian use. In effect, the risk of harm would not be increased over that previously allowed for harmless uses. (Douberley-Florida)

DRAINAGE, FLOOD CONTROL, AND THE CONTROL OF THE USE OF DRAINAGE SYSTEMS IN THE INTEREST OF SANITATION AND PUBLIC HEALTH ARE CLEARLY WITHIN THE FUNCTIONS OF GOVERNMENTAL ACTION. Therefore, the power is granted to the courts to grant petitions for the organization and establishment of districts for drainage and conservancy. Rights and duties of involved landowners are outlined, including provisions for the payment of costs and expenses of such district. Procedural requirements for organizing districts are established, and a board of directors is given the powers necessary to carry out the district's functions. Owners of land abutting upon any body of water are given the power to initiate proceedings to establish a uniform water level, persuant to outlined procedures. Municipalities are given the power to take steps necessary to control or destroy harmful or undesirable aquatic vegetation or organisms in public waters. The policy of the state is declared to be to promote the retention and conservation of all precipitated water in the area in which such precipitation falls. (Smith-Florida)
W70-01585

CONSERVANCY.
Minn Stat secs 111.01-111.20 (1964), as amended, (Supp 1969).

Descriptors: *Minnesota, *Drainage districts, *Reclamation, *Flood control, Drainage programs, Drainage, Water policy, Public health, Environmental sanitation, Water rights, Riparian rights, Costs, Control, Conservation, Governments, Water law, Legislation, Cities, Judicial decisions, Municipal water, Water control, Flood protection, Regulation, Streams, Rivers, River training, Irrigation, Surveys, Reservoirs, Reservoir construction, Gages, Rain gages, Stream gages, Warning systems.

The district court of any county in this state is vested with jurisdiction to establish drainage and conservancy districts for the purpose of: (1) regulating watercourses and the flow of water by altering such watercourses; (2) reclaiming or otherwise protecting lands subject to overflow; (3) irrigation;

(4) prevention of fires; (5) control of flood waters; and (6) providing for sanitation and public health. A petition for the formation of such a district must be signed by at least twenty-five percent of the resident freeholders of the district. Upon the granting of a petition the court appoints a board of directors to determine the need for such a district. The board and its employees may enter upon any lands to make surveys and examinations. Upon the filing of a petition by the board of directors, the district court is empowered to effect the drainage, reclamation, irrigation, or protection of land by issuing the necessary orders and decrees. The board may petition for the creation of reservoirs, water-power plants to be financed by the issuance of bonds, and the temporary removal of bridges. The board may establish and maintain stream and rain gauges and a flood-warning service. (Smith-Florida)
W70-01586

CONSERVANCY.
Minn Stat secs 111.21-111.42 (1964), as amended, (Supp 1969).

Descriptors: *Minnesota, *Riparian rights, *Costs, *Permits, Domestic water, Municipal water, Cost sharing, Cost allocation, Cost-benefit ratio, Repairing, Maintenance, Drainage, Drainage systems, Drainage programs, Water policy, Flood control, Flood protection, Public health, Water rights, Control, Conservation, Governments, Legislation, Cities, Assessments, Usufructuary rights.

Landowners rights to the use of the waters of the district for any purpose shall continue as they existed at the time of the organization of the district. Where improvements made by the district make possible a greater or better use of the waters, the right to such greater use is the property of the district. Such rights may be leased or assigned in return for reasonable compensation. Parties desiring to use the waters of the district must make application to the board, and preference is given to domestic and municipal uses. Expenses are paid out of the general funds of the counties involved in proportion to the benefits received, and each county auditor in turn assesses the property benefited in proportion to the benefit received. The board of directors may levy upon the property benefited such sum as the court may authorize for upkeep and repair of the district. Districts already established may acquire the right to operate under this chapter. The board of directors has full control and authority over all contracts of the district. (Smith-Florida)
W70-01587

CONSERVANCY.
Minn Stat, secs 111.65-111.82 (1964), as amended, (Supp 1969).

Descriptors: *Minnesota, *Water levels, *Vegetation, *Appraisals, Taxes, Water policy, Public health, Environmental sanitation, Water rights, Riparian rights, Costs, Cost allocation, Cost sharing, Conservation, Legislation, Governments, Cities, Municipal water, Domestic water, Benefits, Damages, Control, Assessments.

A majority of the owners of property abutting upon any body of water may initiate proceedings to establish a uniform water level by filing a petition with the district court. Three resident freeholders must be appointed as appraisers to ascertain the damages and benefits that will result. The court may revise, correct, amend, or confirm assessments made by the appraisers, and the amount of benefits assessed against each tract of land is a first lien thereon. The governing body of any city or town may expend funds for the control or destruction of harmful or undesirable aquatic vegetation or organisms in public waters. Such governing body may levy a special tax for such purposes. (Smith-Florida)

WATERS: SURFACE WATER DRAINAGE,
Robin F. Worthington.
U Fla L Rev, vol 2, no 3, p 392-402, Fall 1949, 11 p, 75 ref.

Descriptors: *Legal aspects, *Florida, *Water, *Water law, Civil law, Water rights, Surface runoff, Surface waters, Flood control, Ditches, Flooding, Judicial decisions, Water balance, Routing, Drainage, Drainage systems, Watercourses, Artificial watercourses, Developed waters, Water resources, Natural streams, Non-perennial streams, Perennial streams, Drainage programs, Water policy, Watershed management, Watersheds (Basins).

The disposition and control of surface water between precipitation and collection within defined water courses is discussed. The use of non-surface water is generally governed by the reasonable use doctrine. However, the general law of surface waters is a combination of the reasonable use doctrine, the civil-law rule, which prohibits interference with the natural flow of surface water to the extent that the enjoyment of another's land is disturbed, and the common-enemy or common-law rule which treats water falling on land as a common enemy with which any proprietor has an unlimited and unrestricted legal right to deal as he pleases not withstanding harm resulting to his neighbors. Surface water is defined in Florida as water, regardless of its origin, that drains without any distinct or well-defined channel. A proprietor owns and has an absolute right to surface water on his land. No one may complain if ordinary flow injures his property. However, one may not cause more than normal flow to enter adjoining lands. Florida does not follow either of the traditional doctrines, but rather decides tort liability upon the facts of each case. SEA WALLS AND HIGHWAY PROTECTION.
Miss Code Ann secs 8497 thru 8500 (1956).

Descriptors: *Mississippi, *Diversion structures, *Tidal waters, *Highways, Financing, Costs, Construction costs, Bulkheads, Breakwaters, Barriers, Check structures, Dikes, Roads, Road construction, Cost analysis, Culverts, Legislation, Legal aspects, Sluices, Floodgates, Storms, Federal government, Projects.

The term 'sea wall' includes filling behind the wall, culverts, sluiceways, flood gates, and any other construction work found necessary for the protection of the water from storms, caving banks, and overflow. Each county board of supervisors may erect and maintain seawalls, breakwaters, bulkheads, shore stabilization structures, causeways, bridges, breakwaters, or other necessary improvements to protect public roads which extend along beach or shore lines of tidewaters and which are exposed to damage by water driven ashore by storms. The boards may issue bonds to finance the construction of protective structures and for the improvement or strengthening of exposed roads and highways. The boards must make preliminary plans, specifications, and estimates of construction costs and obtain federal approval with regard to navigation questions before bonds may be issued. (Kelly-Florida)
W70-01601

SCHROEDER V ZIEGELMAN (RIGHT TO USE OF CANAL ON ANOTHER'S PROPERTY).
443 SW2d 16-19 (Ct App Mo 1969).

Descriptors: *Canal construction, *Excavation, *Missouri, *Relative rights, Canals, Conveyance structures, Judicial decisions, Water rights, Lakes, Lake shores, Inlets (Waterways), Land use, Land tenure, Usufructuary right, Legal aspects.

Plaintiff dug a canal extending inland from the water line of a lake across the property of a third party. Defendant, who had no interest in the canal property, filled in the excavation and stated that he would do so again if it were reopened. Plaintiff petitioned for an injunction prohibiting defendant from interfering with plaintiff's re-opening, maintaining, and using the canal. The trial court denied the injunction. On appeal, the court held that since plaintiff had dug the canal and had occupied and taken possession of the land, the injunction was proper. As against a mere tortfeasor, actual possession of land was alone sufficient to maintain an action in trespass, even though plaintiff was without title and had secured his possession originally without the consent of the title holder. That plaintiff may have violated rights of the title holder was immaterial as between the parties to the action. (Douberley-Florida)

THE NAVIGATION SERVITUDE,
John P. Turner.
Title News, Vol 48, No 1, p 42-49, Jan 1969. 8 p, 23 ref.

Descriptors: *Navigation, *Federal government, *Legislation, *Riparian rights, Navigable waters, United States, Legal aspects, Judicial decisions, Water law, Water policy, Condemnation, Riparian land, Structures, Landfills, Jurisdiction, Ownership of beds, Bays, Lakes, Rivers, High water mark, Streams, Low water mark, Dams, Mississippi River, Federal jurisdiction.
Identifiers: *Navigation servitude, Title insurance.

The problems encountered by title insurers in dealing with the navigation servitude are pointed out and the need for corrective legislation is examined. The term 'navigation servitude' is used to describe the fact that the federal government can take property lying within the boundaries of a navigable water body for purposes of navigation without compensating the property owner for the taking. While many aspects of the law concerning the navigation servitude are discussed, two are emphasized: (1) the navigation servitude extends to the ordinary high water mark of navigable streams and may be maintained at that level by artificial means; and (2) within that boundary line, title to all property is defeasible without compensation as against the exercise of the navigation power. The foregoing aspects of the law are examined as possible pitfalls for the insurer. The history of attempts to formulate legislation to meet insurer's problems in this area is discussed. Legislation being formulated by a subcommittee of the American Bar Association is examined from the insurers' viewpoint. The legislation would: (1) make government approval for fill areas act as an estoppel to the navigation servitude; and (2) make government permit issuance for structures act as an estoppel. (Keith-Florida)
W70-01612

LOCAL FLOOD PREVENTION AND WATER SUPPLY.

Va Code Ann secs 15.1-31, 15.1-37, 15.1-37.2 (1964), as amended, (Supp 1968).

Descriptors: *Virginia, *Dam construction, *Local governments, *Flood control, Construction, Dams, Levees, Sea walls, Riparian rights, Compensation, Governments, Public benefits, Legislation, Agriculture, Domestic water, Industrial water, Water sources, Water supply.

Any county, city, or town may construct a dam, levee, sea wall, or other structure, or perform dredging operations to prevent the flooding or inundation of such county, city, or town. No suit at law or equity shall be brought because of such construction or operations except when based on a written contract. This section does not authorize the taking of private property without just compensation. The governing body of every county and town is authorized to: make expenditures in order to acquire land, participate in the construction of dams, and perform all other acts necessary to provide public water for agricultural, residential,

overnmental, and industrial development of the ounty or town. (Smith-Florida)

4B. Groundwater Management

COMBINED USE OF SURFACE AND GROUND WATER FOR THE WATER SUPPLY TO BARCELONA (SPAIN),
M. R. Llamas.
Bull Int Ass Sci Hydrol, Vol 14, No 3, p 119-136, Sept 1969. 18 p, 10 fig, 1 tab, 9 ref.

Descriptors: *Water supply, *Surface waters, *Groundwater, *Conjunctive use, Water quality, Aquifers, Water wells, Water pollution sources, Geology, Hydrogeology.
Identifiers: *Spain, *Barcelona.

The geological and hydrological characteristics of the groundwater reservoirs used for the Barcelona water supply are described. The connection between surface water and groundwater is emphasized. Groundwater meets about 50% of the current 360 mgd water demands for water supply to the Barcelona Metropolitan area. Present and future problems such as water pollution and water shortage, legal questions and education are discussed. The operational plan to solve or to avoid these problems is described. This plan includes combined use of surface and subsurface reservoirs for water conservation. (Knapp-USGS)

Identifiers: *South Platte River, Kersey (Colo), Julesburg (Colo).

Analysis techniques have been formulated for estimating underground water movement in the form of return flows resulting from irrigation. These techniques are applied to irrigation and precipitation water in a mathematical model of a large-scale 'river-aquifer system,' which describes a valley containing a perennial stream underlain by alluvial, water-conducting deposits such that essentially unobstructed flow can occur between stream and aquifer. To substantiate the validity of the groundwater analysis procedures, a model was developed to mathematically describe the interrelationships in the South Platte. The principle of the model was to use known input data, assumptions, idealizations, and analysis to calculate an estimated surface outflow at the downstream gage. If the calculated outflow significantly replicated the recorded outflow, then the theoretical procedures would be verified. The following budgetary equation was used: calculated flow at Julesburg= flow at Kersey+ reservoir return flow+ irrigation return flow+ base return flow - diversions to storage - diversions to irrigation - change in channel storage. APPLICATION OF STANFORD WATERSHED MODEL CONCEPTS TO PREDICT FLOOD PEAKS FOR SMALL DRAINAGE AREAS; HPR-1 (3): KYHPR-64-23,
Lexington Dept. of Highways, Ky. Div. of Research.
K. D. Clarke.
Ky Dep Highways Res Rep, Jan 1968. 106 p, 36 fig, 16 tab, 23 ref. Available from Clearinghouse as PB 184 076, for $3 in paper copy, 65 cents in microfiche.

Descriptors: *Rainfall-runoff relationships, *Model studies, *Flood forecasting, Rational formula, Routing, Mathematical models, Digital computers, Streamflow forecasting, Hydrographs, Hydrograph analysis, Simulation analysis, Water balance, Hydrologic budget.
Identifiers: *Stanford watershed model.

A study was made to achieve two principal objectives: (1) updating rainfall intensity-duration curves for the hydraulic design of culverts and (2) adaptation of the Stanford Watershed Model concept to small drainage basins in Kentucky. Total rainfall was equated to total runoff and losses throughout a span of years; the losses were then accounted for as evaporation, infiltration, and others. Ideally, all of the significant hydrological parameters may be deduced; then through direct measurements of some essential input descriptors and indirect estimates of others, the water-balance concept may be applied to other basins. (Knapp-USGS)

SEIFERT V SOUND BEACH PROPERTY OWNERS ASS'N (WATER DAMAGE FROM IMPROVEMENTS ON ADJACENT PROPERTY).

303 NYS2d 85-90 (Sup Ct 1969).

Descriptors: *New York, *Surface runoff, *Washouts, *Damages, Judicial decisions, Surface drainage, Channels, Land, Runoff, Cloudbursts, Drainage water, Overland flow, Rain water, Precipitation excess, Slopes, Soil erosion, Storm runoff, Floodwater, Floodways, Gullies, Erosion, Flood damage, Soil management.

Plaintiffs removed a large sand dune from the edge of their property but retained a low mound above an adjoining unimproved and sandy roadway. Defendant property owners association later removed several large sand dunes on property immediately adjacent to plaintiffs' property and opened up the roadway for vehicles. During a heavy rainstorm plaintiffs' land was damaged as heavy torrents of surface water rushed over the property from a channel created by removal of the dunes and the downhill grading of the improved roadway. Defendants were held liable for damages to the extent of restoring plaintiffs' eroded land and placing a protective barrier around the property. Removal of the sand dunes alone did not give rise to liability, but channeling the water onto plaintiffs' property by means of the newly improved roadway was held to be actionable. In opening the roadway, the defendant had an obligation to do so without creating a condition likely to cause damage to plaintiffs' property. That the surface waters would flow from the opened roadway onto plaintiffs' land should reasonably have been anticipated, and failure to take steps to prevent the damage constituted negligence. (Douberley-Florida)

MAINTENANCE OF TOWN HIGHWAYS.
R I Gen Laws Ann secs 24-5-16 thru 24-5-19, 24-5-23 (1956).

Descriptors: *Rhode Island, *Highways, *Artificial watercourses, *Bridges, Damages, Watercourses (Legal), Bodies of water, Surveys, Bridge construction, Ditches, Culverts, Local governments, Riparian rights, Legislation, Diversion.

No highway surveyor may cause any watercourse in any highway to be diverted so as to damage any person's land, house, store, shop, building, business, or occupation without the consent of the town council. Any person claiming such damage may complain to the town council. The council examines each claim and may direct the surveyor to alter said watercourse in such a manner as the council deems proper. Whenever any artificial watercourse is made under, through, or beside any previously existing highway, the proprietor of such watercourse must maintain all bridges and fences which are necessitated thereby. Whenever any highway is laid out over or beside any previously existing artificial watercourse, the town laying out such highway must maintain all necessary bridges and fences. Any owner of land adjoining any public highway may build bridges or culverts over ditches in such highway for the purpose of safe and convenient passage from his land to the highway. No such bridge or culvert may be disturbed except by order of the town council. (Smith-Florida)

SOIL AND WATER CONSERVATION.
Miss Code Ann secs 4940, 4941, 4943, 4944, 4947, 4948 (Supp 1968).

Descriptors: *Mississippi, *Erosion control, *Soil management, *Administrative agencies, Legislation, Water conservation, Water policy, Water management (Applied), Water resources development, Conservation, Natural resources, Land management, Cost sharing, Erosion, Soil erosion, Contour farming, Demonstration farms, Land use, Soil conservation, Sediment control, Future planning (Projected), Projects, Project benefits, Project planning, Cost allocation, Cost-benefit ratio.

Provisions are made for the establishment of a state soil and water conservation committee, which is to aid commissioners of soil and water districts, to coordinate their activities, and to secure federal cooperation and assistance in soil and water conservation projects. Procedures for organizing a soil and water conservation district are set out, along with administrative powers and duties. Districts have the power: (1) to conduct soil and erosion research in cooperation with other federal and state agencies; (2) to conduct demonstration projects; (3) to carry out preventive and control measures, with the permission of landowners affected; (4) to give financial aid to individuals and to other agencies; (5) to make available material or equipment needed by landowners to aid in erosion control; (6) to construct or purchase necessary projects; (7) to develop a comprehensive erosion and resources plan; (8) to require cost-sharing by benefitted lands; and (9) to adopt water and land use regulations, subject to landowner approval by referendum. MICROELEMENTS IN THE WATER AND SUSPENDED SUBSTANCES OF RIVERS IN THE ASIATIC USSR,
Nauchno Issledovatelskii Gidrokhimicheskii Institut, Novocherkassk (USSR).
G. S. Konovalov, A. A. Ivanova, and T. Kh. Kolesnikova.
Translation from Gidrokhimicheskii Institut, Gidrokhimicheskiye Materialy, Vol 42, p 112-123, 1967. Soviet Hydrology: Selected Papers No 5, p 533-542, 1967. 5 fig, 1 tab, 10 ref.

Descriptors: *Trace elements, *Suspended load, *Rivers, Elements (Chemical), Manganese, Copper, Cobalt, Water quality, Water chemistry, Geomorphology, Climates, Temperature, Permafrost, Watersheds (Basins), Pacific Ocean.
Identifiers: *USSR, East Siberian Seas, Kara Sea, Laptev Sea, Zinc.

The concentration of V, Mn, Co, Ni, Cu, Zn, Mo, Ag, Sn, and Pb in water and suspended matter of the rivers of the Asiatic USSR is low. This is closely associated with the characteristic physiographic features of the river basins such as: (1) severe climate; (2) low temperatures over most of the year; (3) large volume of water in rivers; and (4) permafrost in the east. The role of the migration of elements in the dissolved form increases in the rivers of the Asiatic USSR. The importance of dissolved elements increases from west to east in the Kara Sea, the Laptev, and East Siberian Seas, and in the Pacific Ocean. The proposed sequence of elements in various basins is rather stable, except for Zn which migrates more with suspended substances in the rivers of the Laptev Sea basin. (Carsten-USGS)
W70-01449

CONTENT OF INDIVIDUAL GROUPS OF ORGANIC SUBSTANCES IN THE WATERS OF SOME SOVIET IVERS,
Nauchno Issledovatelskii Gidrokhimicheskii Institut, Novocherkassk (USSR).

Translation from Gidrokhimicheskii Institut, Gidrokhimicheskiye Materialy, Vol 42, p 171-177, 1967. Soviet Hydrology: Selected Papers No 5, p 549-554, 1967. 1 tab, 34 ref.

Descriptors: *Organic compounds, *Rivers, *Water quality, Organic matter, Amino acids, Proteins, Carbohydrates, Water properties, Humic acids.
Identifiers: *USSR, Nonvolatile organic substances, Organic carbon.

Data are presented on the composition of organic substances in several large rivers in the Soviet Union. The content of organic carbon in the river waters analyzed ranged from 1.9 to 14.9 mg/liter. The content of amino acids, proteins, and amines ranged from 0.04 to 0.025, 0.2 to 0.8, and 0.1 to 0.4 mg/liter, respectively. In terms of glucose carbon, free reducing sugars and complex carbohydrates amounted to 0.03-0.2 and 0.14-0.29 mg/liter. The humic acids varied broadly (5.5-450 mg C/liter). The total content of the mentioned groups amounted to 0.58-1.22 mg C/liter, that is 6-38% of the total content of nonvolatile organic substances determined from carbon. (Carstea-USGS)

IMPROVEMENTS IN AUTOMATIC SAMPLING EQUIPMENT USED TO DETERMINE EXTENT OF POLLUTION IN RUNOFF FROM AGRICULTURAL WATERSHEDS,
Agricultural Research Service, Washington, D.C.
W. M. Edwards, W. W. Bentz, and L. L. Harrold.
US Department of Agriculture, Agricultural Research Service ARS 41-151, ARS 41-151, p 1-16, May 1969. 16 p, 3 fig, 10 photo, 2 chart.

Descriptors: *Runoff, *Water pollution sources, Watersheds (Basins), Pollutant identification, Hydraulic equipment.
Identifiers: *Water pollution determination equipment.

Great care must be exercised in collecting, preparing, and storing runoff samples to be used in studying the loss of pesticides and other chemicals from agricultural lands. Several individual samples must be collected at variable predetermined time intervals throughout the runoff hydrograph of each storm. Each sample must be related to runoff rate at the time of sampling. A detailed description is presented of the construction and operation of automatic sampling equipment installed on experimental watersheds at Coshocton, Ohio. The equipment is designed to operate unattended. It remains on a standby basis and initiates a predetermined sampling sequence at the onset of runoff from the watershed. Samples are collected in 1-gallon glass jugs, which are stored in a refrigerator. The sampling mechanism turns itself off after the total number of samples is collected or if runoff stops before this. This composition of samples collected by the automatic equipment compares very favorable with that of samples collected by hand from below the flume. (National Agricultural Library)

BEHAVIOR OF SURFACTANTS AND OTHER DETERGENT COMPONENTS IN WATER AND SOIL-WATER ENVIRONMENTS,
Geological Survey, Washington, D.C. Water Resources Div.
Cooper Wayman, H. L. Page, and J. B. Robertson.
Fed Housing Admin Tech Studies Publication No FHA 532, Feb 1965. 136 p, 104 fig, 22 tab, 283 ref.

Descriptors: *Surfactants, *Alkybenzene sulfonates, *Detergents, *Groundwater movement, *Water pollution, Infiltration, Analytical techniques, Soil contamination effects, Organic compounds, Dispersion, Sewage effluents, Biodegradation, Methodology.
Identifiers: *Detergent behavior (Water), *Soil-water environment, Anionic surfactants, Synthetic detergents.

This report is primarily concerned with alkylbenzene sulfonate (ABS), the anionic surface-active agent most frequently found in water supplies. The mechanisms and physical principles of detergent movement underground are discussed in a manner to provide background for engineering analysis of pollution problems. Unlike other organic wastes, ABS is not easily broken down by microorganisms, and it moves with sewage effluent, often into groundwater. ABS can be detected in low concentrations and thus used to trace the pollution. The report provides a good technical basis for understanding detergent movement underground; it does not constitute an FHA standard. (Lang-USGS)

TIME-OF-TRAVEL STUDY - MOHAWK RIVER, ROME, NEW YORK TO COHOES, NEW YORK,
Geological Survey, Albany, N.Y.
Harold L. Shindel.
NY State Water Resources Comm Rep of Invest RI-6, 1969. 48 p, 14 fig, 6 tab, 11 ref, 2 append.

Descriptors: *Fluorescence, *Dye releases, *Pollutants, *Velocity, *New York, Channel flow, Hydroelectric plants, Duration curves, Dams, Canals.
Identifiers: *Dye tracing, *Time of travel, Natural purification, Sanitation, Mohawk River, Erie (Barge) Canal.

Flow rate was determined for the 119-mile reach of Mohawk River from Gate 6, Rome, N.Y. to Crescent Dam, Cohoes, N.Y. Large quantities of municipal and industrial effluents are discharged into this reach. A 40% Rhodamine B dye solution was used for traveltime studies during periods of low flow (summer 1966) and high flow (spring 1967). The cumulative time-of-travel for all subreaches was 840 hours for low flows and 210 hours for high flows. Graphs are presented showing magnitude and frequency of discharge and the relationship between traveltime and discharge by subreaches. Based on shape and use, each subreach was classified into one of three types of channel sections: (1) natural river, (2) river-canal, or (3) the power-pool section. The natural river sections include 39.1 mi of the study reach, characterized by shallow cross sections and widening channels, where the traveltime is least. In the 58.9 mi of river-canal, the channel is straightened, dredged, and dammed for canal traffic. Traveltime through the power pools is controlled by the two distinct periods of high and low flow during the canal operation season. (Lang-USGS)

MINAMATA DISEASE AND WATER POLLUTION BY INDUSTRIAL WASTE,
Tokyo Univ. (Japan).
Jun Ui.
Revue Internationale d'Oceanographie Medicale, Vol XIII-XIV, p 37-44, 1969. 1 fig, 5 ref.

Descriptors: *Industrial waste, *Public health, *Water pollution, Industrial plants, Waste water disposal.
Identifiers: *Acetaldehyde synthesis, *Minamata disease, *Organomercuric compound, Chemical industry, Japan.

The author demonstrates the presence of an organomercuric compound in the waste water from the Minamata Factory. The organomercuric compound is a degradation product of a catalyst used in the manufacture of acetaldehyde. The waste water containing the organomercuric compound is discharged to the sea. The author claims that this discharge causes Minamata disease; the factory denies this. (Tyner-Washington)

NATURAL CONTAMINATION HAZARDS IN ARID BASINS,
Geological Survey, Washington, D.C.
J. H. Feth.
In: Groundwater Development in Arid Basins - Symposium, Utah State University, 1967, Proceedings. Utah State University, Logan, p 21-35, 1967. 15 p, 4 fig, 1 tab, 27 ref.

Descriptors: *Arid lands, *Great Basin, *Water quality, *Salinity, *Water pollution, Groundwater, Atmosphere, Brines, Phreatophytes, Dissolved solids, Aquifers.
Identifiers: *Natural contamination sources, Lithosphere.

Examples of contamination by naturally occuring chemical substances in the Great Basin area are discussed. The patterns appear to be similar to those in Arizona, New Mexico and Texas. They were comparable to conditions known in Australia, the Sahara, the Middle East and other arid or semiarid regions. Sources of contamination in the atmosphere, lithosphere, hydrosphere and biosphere as well as chemical characteristics of various contaminated waters were also discussed. Since the Great Basin has been without exterior drainage as far back as the Pleistocene, the amount of potable water of good quality that does occur raises questions which are largely unanswered. (Crouse-Arizona)

RELEASE OF DISSOLVED ORGANIC MATTER BY MARINE SEAWEEDS AND DISTRIBUTION OF THEIR TOTAL ORGANIC PRODUCTION TO INSHORE COMMUNITIES,
Akademiya Nauk URSR. Inst. of Biology of the Southern Seas.
K. M. Khailov, and Z. P. Burlakova.
Limnology and Oceanography, Vol 14, No 2, p 521-527, 1969. 2 fig, 5 tab, 15 ref.

Descriptors: *Organic matter, *Marine plants, *Distribution, *Productivity, Phaeophyta, Rhodophyta, Chlorophyta, Decomposing organic matter, Herbivores, Ecology, Biomass, Ultraviolet radiation, Spectrophotometry, Solar radiation, Temperature, Kinetics, Photosynthesis, Littoral, Synthesis, Seasonal, Respiration, Detritus, Eutrophication, Water pollution sources.
Identifiers: *Release rates, *Inshore communities, Barents Sea, Black Sea, Dasya, Macrophytes, Fucus, Ascophillum, Laminaria, Rhodimenia, Cystoseira, Enteromorpha, Polysiphonia, Cladophora, Callithamnion, Dilophus, Ceramium, Laurencia, Cladostephus, Trophodynamics, Metabolites.

Release rates are estimated of organic matter for macrophytes, five species from Barents Sea and thirteen from Black Sea, under controlled experimental conditions. Rates (in milligrams organic matter/gram (dry weight) of plant per hour) for Barents Sea species varied between 0.9 and 2.9 weight of plants/hour in March; between 1.7 and 9.8 in June. For species from the Black Sea, rates were in range of 1.25 to 6.1 in fast growing plants and 0.5 to 1.6 in slowly growing plants. Total dissolved organic matter released per year have been calculated to be about 39% of gross production in brown algae; about 38% in red algae; and about 23% in green algae. Remainder or organic matter, approximately 30%, was released during decomposition of that part of standing stock not consumed by herbivorous animals. Thus, the total flow of dissolved organic matter from seaweeds during growth and after death may be as much as 70% of their gross production. Ecological significance is discussed of external organic metabolites released to the hydrosphere. (Jones-Wisconsin)

RADIONUCLIDE DISTRIBUTION IN PACIFIC SALMON,
Battelle-Northwest, Richland, Wash. Pacific Northwest Lab.
C. E. Jenkins.
Health Physics, Vol 17, p 507-512, 1969. 2 tab, 23 ref.

Descriptors: *Radioecology, *Salmon, *Pacific Ocean, *Radioisotopes, Gamma rays, Manganese, Cobalt radioisotopes, Alaska, Oregon, Washington, Cesium, Columbia River, Nuclear explosions, Radium radioisotopes, Sodium, Potassium radioisotopes, Iron, Zinc radioisotopes, Sea water, Tracers, Phytoplankton, Food chains, X-rays, Spectrometry, Lead radioisotopes, Analytical techniques, Neutron activation analysis, Effluents, Migration patterns, Fresh water, Fallout, Water pollution sources.
Identifiers: Muscle, Nuclear tests, Scandium radioisotopes, Chromium radioisotopes, Yttrium radioisotopes, Silver radioisotopes, Barium radioisotopes, Europium radioisotopes, Mercury radioisotopes, Tellurium radioisotopes, Concentration factors, Eskimos, Liver, Bone, Seward (Alas), Kenai (Alas), Alakanuk (Alas), Half-life, Thorium radioisotopes, Feeding pattern, Cosmic rays, Bering Sea, Latitudinal distribution, Health physics, Indians.

Because salmon comprises a major portion of diet of Eskimos and Indians living on the west coast of Alaska, author measured 17 gamma-emitting radionuclides in four species of Pacific salmon. Along a gradient from northwestern Alaska through southern Alaska, to the Oregon-Washington Coast, concentrations in salmon muscle tissue decreased by factors from 1.5 to 3 for manganese-54, and 4.5 to 12 for cobalt-60, while concentrations of cesium-137 decreased less pronouncedly (approximately 25%). The Columbia River, Chinese nuclear testing, and other parameters influenced distribution patters of other radionuclides. For manganese-54, cobalt-60, zinc-65, and silver-110m, concentrations were 10- to 100-fold higher in liver as compared with muscle tissue, indicating that the former might serve as a sensitive monitor for presence and approximate concentrations of radionuclides in muscle. Relatively high concentrations of naturally occurring radium-226 in Alaskan salmon, in association with higher levels of artificial radionuclides, are sufficient to cause native fish-eating populations to exceed their maximum permissible concentrations (MPC), where percentage MPC is based upon intakes of 600 grams salmon/day (using MPC/30 as recommended by the International Committee for Radiological Protection for non-occupationally exposed individuals). Author also measured sodium-22, potassium-40, scandium-46, chromium-51, cobalt-57, iron-57, iron-59, barium-140, europium-152, mercury-203, and tellurium-208. (Jones-Wisconsin)

IMPOUNDING RESERVOIRS ON RIVERS, THEIR SIGNIFICANCE FOR THE DISPOSAL OF SEWAGE AND THEIR RELATION TO SECONDARY CONTAMINATION (IN CZECH),
Institute of Hygiene, Prague (Czechoslovakia).
J. Gabriel.
Summaries in English and Russian. Ceskoslovenska Hygiena, V 2-3, (1969) p 166-171.

Descriptors: *Reservoirs, *Water pollution effects, Erosion, *Thermal stratification, *Waste disposal, Water supply, Water quality, Environmental effects, Biochemical oxygen demand, Dissolved oxygen, Organic compounds, Bacteria, Phytoplankton, Surface waters.

The results of comprehensive research on the reservoir Sedlice is presented. This research is focused on the problem of changes in the quality of running water after its impoundment. These changes in the quality of the water were substantially influenced by the 'accumulation factor.' The occurrence of thermal stratification is discussed. Utilizing five indicators (oxygen, organic substances, BOD-5, bacteriomass, phytobiomass) the author demonstrates the favourable effect of this accumulation factor on the quality of water in the reservoir which is connected with the river. By comparison of balance calculations of the accumulation of inflowing water contaminated with waste waters and accumulation without contamination, it was shown that according to some indicators (BOD-5, organic substances) the waste waters account only for 30 percent of the contamination, while surface run off accounts for 70 per cent. From the sanitary point of view, waste waters are not comparable with erosion materials from cultivated soil. Despite this fact it is necessary, with regard to raising the quality of the water in valley reservoirs, to seek effective means of eliminating this surface run off (danger of secondary 'self-contamination'). (novotny-Vanderbilt)

RECHARGING CONSERVES NUCLEAR REACTOR COOLING WATER,
Brookhaven National Lab., Upton, N.Y.
S. H. Wichman, and G. K. Ahlers.
Water and Wastes Engineering, p 79-81, Mar 1967. 4 fig.

Descriptors: *Cooling water, *Recharge, Lagoons, Radioactivity, Ground water.
Identifiers: Reactor-cooling.

A simple well water recycling system has cooled the medical research reactor at the Brookhaven laboratory for five years, without disturbing the natural ground water balance. The reactor is cooled, shielded and moderated by forced circulation of highly purified well water in a closed primary loop, which in turn is cooled by untreated well water. The two systems are never in contact. Additional heat from the dry graphite reflector is removed by forced draft filtered air. The used warm water is piped into one of the two recharge basins, consisting of ordinary precast drainage domes placed over perforated concrete slabs. Effective recharge area is about 1/4 acre. At maximum flow of 2600 gpm, the disposal rate is 0.25 gpm/ft sq, or percolation velocity of 0.4 in. per min. With the continuous disposal of the warm water, no measurable increase of the ground water temperature in the two wells at a distance of 1300 and 2100 feet from the basins has been found. A number of elaborate safeguards against leakage in the heat exchanger have been taken. With daily changeover of the basins, little maintenance is necessary. (Rietveld-Vanderbilt)
W70-01385

THE EFFECTS OF THERMAL POLLUTION ON RIVER ICE CONDITIONS. 1. A GENERAL METHOD OF CALCULATION,
Army Terrestrial Sciences Center, Hanover, N.H.
S. L. Dingman, W. F. Weeks, and Y. C. Yen.
CRREL, Research Report 206, Dec 1967. 35 p, 7 fig, 21 ref.

Descriptors: *Thermal pollution, *Ice, *Rivers, Navigation.

An attempt is made to calculate the length of the ice-free reach which develops during the winter below a thermal pollution site on a river. A differential equation for the steady state heat balance of a volume element of a river is developed, which leads to the expression: x= (C sub x) the integral from (T sub wo) to (T sub wx) of (d (T SUB W)/Q (*)) where x is distance downstream from the pollution site to the cross section where the water temperature equals (T sub wx), (T sub wo) is water temperature at x equals zero, Q (*) is rate of heat loss from the water surface, and C sub x is a constant which includes flow velocity and depth. The value of x at T sub wx equals 0 deg C is taken as the length of the ice-free reach. Q (*) is the sum of the heat losses due to evaporation, convection, long and short wave radiation, and other processes, each of which is evaluated by an empirical or theoretical expression. The two principal limitations in accurately calculating downstream temperature changes are related to difficulties in evaluating the degree of lateral mixing in natural rivers and the convective and evaporative heat losses under unstable atmospheric conditions. Observations of lengths of ice-free reaches on the Mississippi River are in good agreement with the calculated values. Significant portions of the St. Lawrence Seaway can be kept ice-free by the installation of nuclear reactors at appropriate locations. (Upadhyaya-Vanderbilt)
W70-01392

THE ZONE OF POLLUTIONAL EFFECTS (IN FRENCH),
Belgrade Univ. (Yugoslavia).
S. Jankovic, and F. Edeline.
Tribune Du Cebedeau, 21 (1968), No 297-298, p 373-377.

Descriptors: *Water pollution effects, *Water pollution sources, *Pollutant identification, *Thermal pollution, Mixing, Water quality, Standards, Waste dilution, Waste disposal, Self-purification, Biochemical oxygen demand, Stratified flow, Dissolved oxygen, Stratification.

The definition of the size of the zone of pollution influence is stated according to the literature survey presented in the paper. The pollution and its influence is distinguished into 6 groups; (1) thermal pollution (calories), (2) dissolved solids, (3) colloids, (4) suspended solids, (5) sediments, and (6) solids reacting chemically with the aqueous environment. To determine the zone of influence, knowledge of hydraulic parameters is of importance. Two different approaches are mentioned; (1) Czechoslovakian definition--the zone of influence could be looked upon as the zone where exceeding a limit is tolerable, the dilution of pollutants is calculated as the dilution by the entire discharge, (2) Romanian definition--the zone of influence represents a factor of safety, the comparison of diluted pollutants to limits is carried out in a part of the stream, not in the entire cross section. The results of several studies found in the literature are presented and discussed. (Novotny-Vanderbilt)
W70-01395

RECORD LOW DISSOLVED OXYGEN IN THE ISLAND AREA OF LAKE ERIE,
Ohio State Univ., Columbus. Coll. of Biological Sciences; and Ohio State Univ., Dept. of Zoology and Entomology.
N. Wilson Britt, Edwin J. Skoch, and Kenneth R. Smith.
The Ohio J Sci, Vol 68, No 3, p 175-179, May 1968. 5 p, 1 fig, 12 ref.

Descriptors: *Lake Erie, *Lakes, *Dissolved oxygen, Sampling, Seasonal, Winter, Summer, Air temperature, Statistical methods, Wind velocity, Dissolved solids, Plant growth, Nutrients, Nitrogen, Phosphorus, Physicochemical properties, Weather patterns, Climates.
Identifiers: *Oxygen depletion (Lake Erie), Lakewater dissolved oxygen.

The dissolved oxygen content of Lake Erie was investigated by collecting daily samples from June 22 to August 31, 1966 at a single station south of Rattlesnake Island. Dissolved oxygen near the bottom fluctuates considerably from 0.1 ppm recorded on July 1 to 9.2 ppm on July 19. Two more low periods were recorded on August 7 (3.7 ppm) and August 30 (3.0 ppm). In each of these 2 cases, the low-oxygen condition was associated with an average wind speed of about 6 knots and air temperature of about 26 deg C. Statistical analysis indicates a significant relationship between wind speed and dissolved oxygen. (Gabriel-USGS)
W70-01425

PRIMARY PRODUCTIVITY - PHYTOPLANKTON RELATIONSHIPS, HODGSON LAKE, PORTAGE COUNTY, OHIO,
Kent State Univ., Ohio. Dept. of Biological Sciences.
John H. Olive, John H. Morrison, and Charles V. Riley.
The Ohio J Sci, Vol 68, No 3, p 152-160, May 1968. 9 p, 4 fig, 3 tab, 30 ref.

Descriptors: *Lakes, *Productivity, *Phytoplankton, *Ohio, Diatoms, Seasonal, Winter, Photosynthesis, Carbon, Organic matter, Biomass, Chlorophyll, Temperature, Ice, Chlorides, Oxygen, Silica, Phosphates, Iron, Light penetration.
Identifiers: Hodgson Lake (Ohio), Lake productivity.

Primary productivity-phytoplankton relationships were studied in 1963-1964 in Hodgson Lake, Ohio. The lake was found to be a 'blue-green-diatom' reservoir of moderate productivity, but containing a large phytoplankton standing crop. Average cell volumes varied from 1.4 cu mm per liter in September to about 88.6 cu mm per liter in June. Photosynthesis ranged from 4-5 mgC per sq m per day during the winter and about 2600-2700 mgC per sq m per day in June and October. (Gabriel-USGS)
W70-01426

CHRONIC TOXICITY OF COPPER TO THE FATHEAD MINNOW (PIMEPHALES PROMELAS) IN SOFT WATER,
Federal Water Pollution Control Administration, Cincinnati, Ohio. Newtown Fish Toxicology Lab.
Donald I. Mount, and Charles E. Stephan.
J Fish Res Bd Canada, Vol 26, No 9, p 2449-2457, 1969. 6 tab, 8 ref.

Descriptors: *Copper, *Hardness (Water), *Minnows, *Toxicity, Fish.
Identifiers: *Application factor, *Pimephales promelas, Toxicity bioassay, Chronic toxicity, 96-hr TLm.

The application factor is defined by the authors as the 'maximum acceptable toxicant concentration (MATC)' divided by the 96-hr TLm. They suggest the application factor as a means of determinimg safe concentrations of toxic pollutants. In this paper they determine that the MATC of copper for the fathead minnow (Pimephales promelas) in water having an EDTA hardness of 30 mg/liter (as CaCO3) is between 0.13 and 0.22 of the 96-hr TLm value. In an earlier study the application factor for copper in water with an EDTA hardness of 200 mg/liter (as CaCO3) was found to be between 0.03 and 0.08 for the same species. Various factors lead the authors to conclude that the experiments reported are not conclusive evidence that hardness does or does not affect the application factor for copper and fathead minnows. They suggest refinements which should increase the accuracy and precision of future determinations of application factors. (Tyner-Washington)

EFFECTS OF THE TREATMENT OF AN OYSTER BED WITH POLYSTREAM AND SEVIN,
Virginia Inst. of Marine Science, Gloucester Point.
Dexter Haven, Michael Castagna, Paul Chanley, Marvin Wass, and James Whitcomb.
Chesapeak Sci Vol 7, No 4, p 179-188, Dec 1966. 9 tab, 12 ref.

Descriptors: *Molluscasides, *Oysters, *Pest control, *Pesticides, *Snails, Mollusks, Benthic fauna.
Identifiers: *Crassostrea virginica, *Drills, *Polystream, *Sevin, *Urosalpinx cinerea, Hog Island Bay (Va).

A series of field tests near Wachapreague, Virginia, in 1963 evaluated Polystream and Sevin mixed with sand as a means of controlling populations of oyster drills, Urosalpinx cinerea. Tests were designed to evaluate effects on planted oysters, drills, drill egg case deposition, crabs, and benthic invertebrates. Application of the chemicals to planted oyster beds did not reduce drill populations or numbers of drill egg cases deposited. Oyster production was not increased and treatment had an adverse effect on most species of benthic macroinvertebrates. Absence of drill control could have been associated with mixing of treated sand into subsurface deposits but other factors may have been involved. (Tyner-Washington)
W70-01459

SHORT-TERM EFFECTS OF 2,4-D ON AQUATIC ORGANISMS IN THE NAKWASINA RIVER WATERSHED SOUTHEASTERN ALASKA,
Bureau of Commercial Fisheries, Auke Bay, Alaska.
Howard S. Sears, and William R. Meehan.
US Dept of Interior, Fish and Wildlife Service, Bureau of Commercial Fisheries, Biological Laboratory, Auke Bay, Alaska, Sept 1969. 24 p, 2 tab, 11 appended tables.

Descriptors: *Herbicides, *Trout, *Diptera, Aquatic animals, Aquatic insects.
Identifiers: *2-4-D, *Nakwasina River, *Vegetation control, Aerial spraying, Coho salmon fry, Plecoptera, Ephemeroptera, Dolly Varden trout.

The Forest Service sprayed 2,4-D on logged off land on Baranof Island to control Red alder at a rate of 2 lbs/acre. There was no significant immediate mortality to fish (Coho salmon and Dolly Varden) and aquatic insects even in streams that were sprayed directly. Water samples and fish tissue samples analyzed for 2,4-D content showed concentration levels below those considered lethal. (Katz-Washington)

ORGANOCHLORINE PESTICIDES IN THE ENVIRONMENT,
Bureau of Sport Fisheries and Wildlife, Laurel, Md. Patuxent Wildlife Research Center.
Lucille F. Stickel.
Fish and Wildlife Service, Bureau of Sport Fisheries and Wildlife, Special Scientific Report - Wildlife No 119, Oct 1969. 32 p, 3 tab, 210 ref.

Descriptors: *Pesticides, *Pesticide kinetics, *Pesticide toxicity, *Chlorinated hydrocarbon pesticides, Pesticide residues, Aquatic life.
Identifiers: *Residues-birds, *Field mortalities, *Population changes, *Physiology, *Reproductive changes, Residues - fish and shellfish.

A thoroughly and extensively documented review of the biological changes caused by chlorinated hydrocarbon pesticides. Author documents the residues found in wild animals, fish, shellfish, birds, including water birds. The kinetics of chlorinated hydrocarbon pesticides in the aquatic and terrestrial environment is described. Experimental studies of pesticide kinetics in the individual organisms including fish and shell fish are described and the results are presented. A list of some pesticide mortalities of fish and fish-eating birds is given. The changes in populations of fish, aquatic insects, and birds are described. The changes in the reproductive patterns of mammals, birds, and fish subjected to chlorinated hydrocarbons are described. The data on the changes in reproduction, especially that of fish-eating birds in relation to residues in eggs and adults, is presented. Research needs are also discussed. (Katz-Washington)

THE BIOLOGICAL AND ECOLOGICAL EFFECTS OF ACID MINE DRAINAGE WITH PARTICULAR EMPHASIS TO THE WATERS OF THE APPALACHIAN REGION,
Washington Univ., Seattle. Coll. of Fisheries.
Max Katz.
'Impact of Mine Drainage on Recreation and Stream Ecology', Appendix F, Ecology in Acid Mine Drainage in Appalachia, Appalachian Regional Commission, Washington, DC, June 1969. 65 p, 5 tab, 200 ref.

Descriptors: *Acid mine water, *Brook trout, *Appalachian Mountain Region, *Water pollution, *Toxicity, Eco system, Fish stocking effects, Water resources, *Acid streams, Birds, Mammals, Reptiles, Aquatic plants, Bioassays, Domestic wastes, Self purification, Fish reproduction.
Identifiers: *Fathead minnow, *pH, Dissolved iron, Fish growth, Benthos, Fishery management procedures.

An extensive review of the published world literature on the effects of acidic waters and acid mine drainage water on the receiving streams. Spawning of fish is inhibited below pH 7.0. Brook trout are more tolerant to low pH than rainbow trout and can tolerate pH below 5.0 and 6.0. The cause of death of fish held at low pH is due to acidemia. If food is sufficient, fish can grow well in water below pH 7.0. Acid waters can be reclaimed by adding lime. In acid lakes as the pH increases toward neutrality, the number of aquatic plants increases. Aquatic insects are limited by pH levels below 4.0. Purification of domestic wastes is inhibited in acid mine waters. A stocking program of trout will provide recreational fishing if the pH is maintained above 6.0. For non-trout species, the pH should be maintained at pH 6.5 or above, but stocking is not required. (Katz-Washington)

Centre d'Etudes et de Recherches de Biologie et d'Oceanographie Medicale, Nice (France).
M. Aubert, R. Charra, and G. Malara.
Revue Internationale d'Oceanographie Medicale, Vol XIII-XIV, p 45-72, 1969. 14 fig, 7 tab, 7 ref.

Descriptors: *Detergents, *Insecticides, *Toxicity, *Water pollution, Food chains, Aquatic algae, Brine shrimp, Fish, Mussels.
Identifiers: *Hydrocarbon, *Toxicity threshold.

The threshold toxicities of 5 chemical pollutants (3 detergents, 1 insecticide, 1 hydrocarbon) were determined for organisms from 3 levels of the food chain (phytoplankton, zooplankton, fish). The results show that the toxicity of the chemicals varies from one organism to another and from one life stage to another in the same organism. (Tyner-Washington)

STUDY OF THE BIODEGRADABILITY OF TOXIC CHEMICAL PRODUCTS WITH RESPECT TO THE MARINE FOOD CHAIN (FRENCH),
Centre d'Etudes et de Recherches de Biologie et d'Oceanographie Medicale, Nice (France).
M. Aubert, and J. P. Gambarotta.
Revue Internationale d'Oceanographie Medicale, Vol XIII-XIV, p 73-105, 1969. 19 fig, 3 tab, 8 ref.

Descriptors: *Biodegradation, *Detergents, *Insecticides, *Marine bacteria, *Toxicity, *Water pollution, Aquatic algae, Brine shrimp, Fish, Food chains, Mussels.
Identifiers: *Hydrocarbon.

Test solutions of 5 chemical pollutants (3 detergents, 1 insecticide, 1 hydrocarbon) at concentrations twice the previously determined threshold doses for the organisms in question were subjected to degradation by marine microorganisms for 3, 6, or 9 days prior to the introduction of the test organisms. These organisms were drawn from different levels of the food chain; primary producers, 2 species of phytoplankton· herbivores, zooplankton and mussels; carnivores, fish. In some cases biological degradation of the chemical pollutant caused a reduction in toxicity. (Tyner-Washington)
W70-01467

STUDY OF THE EFFECTS OF CHEMICAL POLLUTANTS ON PLANKTON: DEGRADABILITY OF FUEL BY SOIL AND MARINE MICROORGANISMS (FRENCH),
Centre d'Etudes et de Recherches de Biologie et d'Oceanographie Medicale, Nice (France).
M. Aubert, J. Aubert, S. Daniel, and J. P. Gambarotta.
Revue Internationale d'Oceanographie Medicale, Vol XIII-XIV, p 107-123, 1969. 9 fig, 10 ref.

Descriptors: *Biodegradation, *Fuel, *Marine microorganisms, *Water pollution, Diatoms.
Identifiers: *Hydrocarbon, *Terrestrial microorganisms, Asterionella japonica.

The authors determined the threshold toxicity of fuel oil on the marine diatom Asterionella japonica. They allowed marine microorganisms and terrestrial microorganisms from sewage to biodegrade the fuel oil and then they introduced cultures of the diatoms. The resulting growth curves showed the extent to which the microorganisms had detoxified the fuel oil. The authors estimate that the microorganisms in the marine environment can degrade approximately 200 grams of fuel oil per cubic meter per year. (Tyner-Washington)

EFFECTS OF 'TORREY CANYON' TYPE POLLUTION ON THE UNICELLULAR MARINE ALGA PHAEODACTYLUM TRICORNUTUM (FRENCH),
Laboratoire de Physiologie Generale et Compare du Museum, Paris (France); and Laboratoire de Physiologie des Etres Marins de l'Institut Oceanographique, Paris (France).
J. C. Lacaze.
Revue Internationale d'Oceanographie Medicale, Vol XIII-XIV, p 157-179, 1969. 3 fig, 2 tab, 36 ref.

Descriptors: *Detergents, *Diatoms, *Oil, *Oil wastes, *Surfactants, *Water pollution, Cleaning, Disasters, Oily water, Marine algae, Ships.
Identifiers: *Crude oil, *Gamosol, *Oil spills, *Torrey Canyon, Aromatic solvents, Phaeodactylum tricornutum.

The author studied the effects of both crude oil (of the sort carried by the 'Torrey Canyon') and Gamosol (a detergent used to disperse oil) on Phaeodactylum tricornutum, a marine diatom. A 10% reduction in growth was observed in cultures prepared with 1% petroleum extracts. After aeration the reduction in growth was 5%, some toxic volatile compounds having been eliminated and the oxygen concentration increased. Petroleum extracts which had been previously raised to a temperature above 100 deg C exhibited an increased toxicity (35% reduction in growth). Gamosol (14% nonionic surfactants and 86% aromatic solvents) is more toxic (50% reduction in growth after exposure to 5.6 ppm) than the surface active fraction (50% reduction in growth after exposure to 8 ppm). However, this toxicity varies because of the high volatility of the solvent in dilute solution. A 30 minute exposure to 40 ppm Gamosol killed the cells. (Tyner-Washington)

THE PROBLEM OF RED WATER (FRENCH),
Centre d'Etudes et de Recherches de Biologie et d'Oceanographie Medicale, Nice (France).
J. M. Pincemin.
Revue Internationale d'Oceanographie Medicale, Vol XIII-XIV, p 181-203, 1969. 3 fig, 61 ref.

Descriptors: *Dinoflagellates, *Red tide, Fishkill, Public health, Nutrients, Salinity, Water temperature.
Identifiers: *Causes of red water, *Red water.

The author through personal research and bibliographic study surveys the problem of red water. He begins by enumerating its characteristics: color, categories and numbers of individuals, localization, duration and toxicity. He then looks at the evolution of the process. The seawater is calm and has a temperature higher than the preceding days. The salinity is generally lower. The quantity of nutrients, though larger than usual, is not sufficient to explain the high rate of multiplication. The accumulation of organisms is therefore explained by accelerated multiplication in a thick layer of seawater followed by vertical concentration (positive phototaxis and reduced density of the organisms) and horizontal concentration by winds. The usual monospecificity is thought to be due to the complexity of the ecological needs of the species. (Tyner-Washington)
W70-01471

APPEARANCE OF RED WATER CAUSED BY COCHLODINIUM SP. IN THE BAY OF JUAN-LES-PINS (FRENCH),
Centre d'Etudes et de Recherches de Biologie et d'Oceanographie Medicale, Nice (France).
J. M. Pincemin.
Revue Internationale d'Oceanographie Medicale, Vol XIII-XIV, p 205-216, 1969. 4 fig, 1 tab, 18 ref.

Descriptors: *Red tide, *Dinoflagellates, Salinity, Water temperature, Nutrient requirements.
Identifiers: *Red water, Causes of red water, Juan-les-Pins, *Cochlodinium sp.

An occurrence of red water containing 30 to 80 million Cochlodinium sp. cells per liter was reported during 4 days of June, 1968, in the Bay of Juan-les-Pins. The mass of seawater containing the organisms was of lower salinity and higher temperature than the surrounding water and had a larger concentration of nutrients. The high concentration of Dinoflagellates is explained by both vertical (positive phototaxis and reduced density) and horizontal (wind) concentration. Culture studies showed that Cochlodinium sp. has highly specialized requirements and that it inhibits Chaetoceros sp. (Tyner-Washington)

LITERATURE REVIEW 1967 (TEMPERATURE).

Journal of Water Pollution Control Federation, Vol 40, No 6, p 1021-1022, 1024-1033, June 1968. 14 ref.

Descriptors: *Temperature, *Fish, *Publications, *Fish behavior, Fish food organisms, *Reviews, Bibliographies.
Identifiers: Cold water discharge, Cold water salmonid streams, Warm water centrarchid environment.

The American literature of 1967 is surveyed on the effects of temperature on fish life. Main topics are acclimation of fish to different temperatures, including standards for temperature regulations for cold water salmonid streams, warm water centrarchid environments, and estuaries. One article is review on cold water discharge. (Rietveld-Vanderbilt)
W70-01474

LITERATURE REVIEW, 1967, (THERMAL POLLUTION - BIOLOGICAL EFFECTS),
C. C. Coutant.
Journal of Water Pollution Control Federation, Vol 40, No 6, p 1047-1052, June 1968. 37 ref.

Descriptors: *Thermal pollution, *Publications, *Fish behavior, *Aquatic life, Thermal power plants, Dissolved oxygen, *Reviews, Bibliographies.

This article reviews the literature of 1967 on the biological effects of thermal pollution. The main topics are the biological problems associated with nuclear power plants, water criteria to protect aquatic life, DO in streams in correlation with thermal pollution, influence of temperature on aquatic life, resistance of cells to high temperature; relationship of water temperature to growth of some fish, preference temperatures of some fish, constructive uses of waste heat from thermal power plants. (Rietveld-Vanderbilt)

ENVIRONMENTAL FACTORS RELATING TO LARGE WATER PLANTS,
Battelle Memorial Inst., Richland, Wash.
H. M. Parker.
Water Production Using Nuclear Energy (Ed by R G Post and R L Seale), p 209-26, 44 ref, Univ Arizona Press, Tucson (1966). (Proc Am Nucl Soc Symp, Mar 1966, Tucson).
Identifiers: *Reviews, *Site selection criteria, *Waste disposal, Algae control, Microorganism control, Saline contamination, Wastes, Water biology.

A state-of-the-art review on the effect of thermal and saline pollution from a large-scale nuclear dual-purpose plant on the marine life in the area around the plant site. Present regulations appear to cover the aspect of the release of radioactive material. However, restrictions on thermal and saline water release are not uniform. Temperature and salinity are two of the most potent physical factors in the life of marine and brackish water organisms, since they largely characterize the physicochemical properties of the medium. There is a complex correlation between the biological effects of temperature and salinity - temperature can modify the effects of salinity, and salinity can modify the effects of temperature. Changes in temperature and salinity alter the physical and chemical properties of water, and organisms react to the total environment. Therefore, detailed effects ascribed to temperature and salinity alone cannot be defined.

AQUATIC WEEDS,
Wisconsin Univ., Madison. Coll. of Agriculture; and Agricultural Research Service, Fort Lauderdale, Fla. Crops Research Div.
L. G. Holm, L. W. Weldon, and R. D. Blackburn.
Science, Vol 166, p 699-709, Nov 1969. 10 fig, 29 ref.

Descriptors: *Aquatic weeds, *Eutrophication, Lakes, Dams, Streams, Vegetation, Rivers, Drainage, Navigation, Water hyacinth, Vectors (Biology), Herbicides, Harbors, Irrigation, Hydroelectric plants, Diseases, Reservoirs, Evapotranspiration, Floods, Florida, Wisconsin, Alabama, Louisiana, Mississippi, Canals, Rice, Watershed management, Shellfish, Bulrush, Cattails, Alligatorweed, Phreatophytes, Cottonwoods, Mesquite, Biocontrol, Water pollution effects, Mechanical equipment, Mosquitoes, Snails, Tilapia.
Identifiers: *Resources management, Infestations, Pistia stratiotes, Eichhornia crassipes, Salvinia auriculata, Africa, Central America, South America, Asia, Australia, New Zealand, Lemnaceae, Cyperus papyrus, Hydrilla.

The supply of both water and soil are limited. Rampant growth of aquatic weeds is symptomatic of the failure to manage resources. Many water sources of Asia and Africa, and of Wisconsin and Florida, are so fertile and so well innoculated with aquatic weeds that they can no longer correct themselves. Using combinations of mechanical, biological (turning nature against itself), and chemical (selective herbicides) methods of control, we can help with the restoration of watercourses. The scourge of some major rivers in water hyacinth, now generally distributed in Africa, and in many lakes, streams, and reservoirs of Central and South America. Floating mats of water fern, with water lettuce, infest Lake Kariba, Africa. These mats serve as host sites for mosquito larvae. Submersed weeds invade waterways rapidly; emersed weeds are troublesome in irrigation and drainage systems, and Phreatophytes waste water of stream channels. Islands of large masses of floating dead aquatic vegetation are impossible to cope with in channels of main streams. Papyrus of African waterways, frequently mixed with a robust grass, is one of the principal plants forming these islands. (Jones-Wisconsin)

POLLUTION: A STUDY IN ECOSYSTEM PATHOLOGY,
Federal Water Pollution Control Administration, Washington, D.C. Office of Estuarine Studies.
Harold Berkson.
Preprint of paper presented at meeting of the American Society of Limnology and Oceanography, June 17, 1968, Madison, Wisconsin. 9 p.

Descriptors: *Ecosystems, *Pollution abatement, Water pollution effects, Pesticides, Fishkills, Epidemics, Water pollution control, Eutrophication, Nutrients.
Identifiers: *Environmental quality, *Ecosystem pathology, *Environmental modifications, Nutrient balance, Biological magnification, Genetic alteration, Mercury contamination, Organic hydrocarbons, Minamata disease, Sphaerotilus natans, Nannochloris atomus.

Effects of pollution on aquatic organisms and their ecosystems range from the large scale, well publicized, disasters, such as massive fishkills, down to most subtle changes in the ecosystem. The author cites examples from four categories illustrating the range of pollution effects. (1) Change in the environment, such as additions of high concentrations of toxic substances, DDT for example; introduction of crude oil, and presence of excess silt, which give rise to familiar biological problems of pollution. (2) The environment may be altered by enhancing growth of undesirable organisms, such as Sphaerotilus natans (associated with carbohydrate-containing wastes), and Nannochlorus atomus whose growth is enhanced by nutrient imbalance. (3) 'Biological magnification' refers to substances which are toxic only after passing through a portion of the food chain or at a specific point in an organism's life. (4) Teratogenic effects and genetic alterations; for example, a localized cerebral palsy epidemic in Japan was associated with consumption of fish caught in a bay into which mercury was discharged by a manufacturer. We are able to recognize massive disasters and destroyed ecosystems after the fact, but lack the capability to diagnose incipient problems and predict effects of environmental modification. 5D. Waste Treatment Processes

EVAPORATION SYSTEM RECOVERS CHEMICALS FROM PLATING WASTES,
Pfaudler Permutit, Inc., Rochester, N.Y.
J. M. Culotta.
Water and Wastes Engineering, p 62-64, Mar 1967. 4 fig, 1 tab.

Descriptors: *Industrial wastes, *Evaporators, *Heat exchangers, Heat transfer, *Thermal pollution.
Identifiers: *Metal finishing wastes, *Waste heat, Rinse water, Closed loop, Dragout.

Significant advances have been made in handling cyanide and chromic acid plating waste operations by new sophisticated systems that recover the bulk of the wastes by evaporation, and neutralize or chemically destroy only the small fraction which is not economically recoverable. Described are: the closed-loop system, in which a single-effect evaporator concentrates flow from the rinse water holding tank, and the open-loop system. The circulation loop through the evaporator is opened by creating another loop for the cyanides. The dragout solution can be retreated before sewering. An economic table-analysis of this system is given. In the third system, called optimized system, 80-90% of the chromic acid normally lost by dragout is recovered from waste, through evaporation, by utilizing waste heat. This helps prevent thermal pollution also. (Rietveld-Vanderbilt)

WATER-QUALITY IMPROVEMENT BY GROUND-WATER RECHARGE,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
Herman Bouwer.
Proc 2nd Seepage Symp, Phoenix, Ariz, Mar 25-27, 1968, Agr Res Serv Rep 41-147, p 23-27, 1969. 5 p, 9 ref.

Descriptors: *Artificial recharge, *Waste water treatment, Biodegradation, Soil disposal fields, Denitrification, Water quality, Water chemistry, Water pollution control, Sanitary engineering, Sewage disposal, Water reuse, Groundwater movement.
Identifiers: Water quality improvement.

Aerobic percolation of low-quality water through soil to the water table and subsequent lateral movement below the water table can be effective mechanisms for removing biodegradable material, pathogenic organisms, and certain inorganic substances such as metals from the water. Recharge basins should be managed to avoid accumulation of suspended material on the bottom and to allow sufficient oxygen to enter the soil during dryups to satisfy the total oxygen demand of the water that has entered during inundation. Also, the basins should be so laid out and operated to avoid excessive water-table buildups while at the same time achieving maximum recharge per unit basin area. Nitrogen in the low-quality water will appear mostly as nitrates in the renovated water. For renovated sewage effluent, the nitrate content may be two to four times higher than the permissible limit for drinking water. Nitrate reduction by denitrification or other processes is emerging as a major problem in renovating sewage effluent, and research in this area is being intensified. (Knapp-USGS)

SULFIDE TREATMENT OF ACID MINE DRAINAGE.
Bituminous Coal Research, Inc., Monroeville, Pa.

Water Pollution Control Research Series, DAST-2, Nov 1969. 65 p, 6 tab, 9 fig, 41 ref. Available from the Clearinghouse as PB 187 866, $3.00 in paper copy, $0.65 in microfiche. FWPCA Grant No 14010 DLC.

Descriptors: Pollution abatement, Limestones, Hydrogen sulfide, *Sulfides, *Waste water treatment, Stream pollution, *Mine drainage, Coal mine wastes.
Identifiers: *Coal mine drainage, Iron sulfides.

The studies reported herein were a continuation of a 12-month program initiated in June 1967 with funds from the Appalachian Regional Commission. During this earlier program a process for the treatment of coal mine drainage was conceived, involving the combined addition of limestone and hydrogen sulfide to effect precipitation of iron sulfides (LHS process). Results of laboratory-scale continuous flow tests of the LHS process during the current program indicated that hydrogen sulfide feed must be accurately predetermined and controlled to effectively precipitate iron, yet to avoid an excess of reagent in the process effluent. The black sludge formed during treatment undergoes oxidation at a rate depending on drying conditions, with formation of elemental sulfur. X-ray diffraction analyses indicate the iron sulfide sludge component is an amorphous material, although chemical analyses indicate it is initially a stoichiometric compound whose empirical formula corresponds to that of ferrous sulfide. The unstable nature of the sulfide sludge, possibility of polysulfide formation during treatment, instability of mine waters of the type amenable to treatment, and inadequacies of available gas metering equipment are among the factors which militate against the controlled regulation of hydrogen sulfide feed necessary for successful operation of the process. These factors, and additional disadvantages revealed by an updated cost evaluation, lead to the conclusion that the LHS process is less attractive than accepted methods of mine drainage treatment.

PROCESS FOR TREATING WATER.

British Patent 955, 321 to Esso Research and Engineering Company. Apr 15, 1946.

Descriptors: *Waste water treatment, *Organic compounds, *Chemical wastes, Treatment facilities, Oxidation, Temperature, Activated carbon, Sewage, Biodegradation, Detergents, Electrodialysis, Absorption, Activated sludge, Foam fractionation, Aeration, Acidity, Carbon dioxide, Solid wastes, Foaming.
Identifiers: Alkylbenzene sulfonates, Dyeing wastes, Solar evaporation.

A process is claimed for removing water-soluble organic compounds from sewage-works effluents and trade waste waters which are free from suspended solids. High-molecular compounds, particularly low concentrations of non-biodegradable water-soluble compounds, such as synthetic detergents, are removed by foam fractionation, and low-molecular organic compounds are then removed by electrodialysis or absorption on activated carbon. A design is also claimed for a treatment plant incorporating an activated sludge unit, foam-fractionation column, and apparatus for collapse of foam by heating or agitation. Effluent from the activated sludge tank is passed to the foam-fractionation column, or, alternatively, if foam is present in the activated-sludge tank it may be skimmed off and passed direct to the foam-collapsing apparatus. Gas is taken from the aeration tank and supplemented with air for use in foaming. Fine bubbles are used and the bubble size and acidity must be controlled carefully. The rate of gassing must be adjusted to maintain a distinct foam-liquid interface and a stable foam must also be maintained (by using a foam column of narrow diameter and, if necessary, adding a small amount of alkylbenzene-sulphonate to increase the foam stability of weakly surface-active contaminants). The collapsed foam can be recirculated to the foam-fractionation column to further concentrate the organic impurities which are subsequently oxidized to carbon dioxide and water at high temperature and pressure. Alternatively, organic compounds, such as phenol, could be recovered from the collapsed foam by solar evaporation. When used to treat secondary sewage effluents, the process removed 87 percent.

PLASTICS IN WASTE TREATMENT,
M. W. Askew.
Process Biochem, Vol 1, p 483-486, 492, 1966; Vol 2, p 31-34, 1967.

Descriptors: *Standards, *Waste treatment, *Plastics, *Filtration, Activated sludge, Waste water treatment, Foods.
Identifiers: Polyvinyls.

The author discusses the standards for trade effluent imposed and expected in Europe, Canada and U.S.A. As a result of these higher standards new methods of treatment have been devised using polyvinyl chloride corrugated-sheeting units which can be used in place of established biological filtration media, where cost, space and technical problems make the use of activated-sluge tanks and other conventional methods impracticable. The characteristics of Flocor medium and its advantages over conventional filter media are described and examples are given of its use to treat waste waters from distilleries, breweries, fruit and vegetable processing, and textile plants. (Livengood-North Carolina State Univ)

DISPOSAL OF SEWAGE EFFLUENT AT MADISON, WIS,
Madison Metropolitan Sewerage District, Wis.
H. O. Lord.
Sewage and Industrial Wastes, Vol 22, No 1, Jan 1950. 1 fig.

Descriptors: *Sewage effluent, *Legal aspects, *Legislation, Sanitray districts, Chemical precipitation, Trickling filters, Activated sludge, Nitrogen, Phosphorus, Wisconsin, Water pollution sources, Water pollution effects, Waste treatment, Nutrients, Eutrophication.
Identifiers: *Effluent disposal, *Madison (Wis), *Treatment requirements, Nuisance conditions, Algal growth, Nutrient sources, Lake investigations, Court orders, Effluent quality, Lake Mendota (Wis), Lake Monona (Wis), Lake Kegonsa (Wis), Lake Waubesa (Wis), Yahara River (Wis).

An historical account is presented of disposal of sewage effluents at Madison, Wisconsin, from 1884 (when sanitary districts served by public sewers were first developed) to 1950. In 1898, the first sewage treatment began, utilizing chemical precipitation. In 1901, a trickling filter plant replaced the original unit. Activated sludge treatment was inaugurated in 1914. Population growth by 1928 necessitated addition of a second plant and several subsequent modifications. Nuisance conditions have long been attributed to the lakes' overenrichment with sewage effluents. A committee, appointed by the Governor in 1941, to study the Madison lakes, proposed that removal of nitrogen and phosphorus from effluents would significantly contribute to abatement of the nuisance conditions. The legislature enacted a law in 1943, prohibiting discharge of sewage effluents into lakes (apparently tailored specifically for the Madison area). An order by the State Board of Health, requiring Madison's sewage effluent to be discharged outside the drainage basin, was found unlawful and reversed after judicial review in 1948. The original 1943 law was amended in 1949 to permit exemption from the requirement if adequate treatment was provided. (Ketelle-Wisconsin)

5E. Ultimate Disposal of Wastes

SOIL SEALING CHEMICALS AND TECHNIQUES,
Diamond Shamrock Corp., Painesville, Ohio. T. R. Evans Research Center.
J. J. Mannion, and D. J. Porter.
Available from the Superintendent of Documents, US Gov't Printing Office, Washington, DC, 20402, for $0.40 per copy. Office Saline Water Res and Develop Progr Rep No 381, 1968. 31 p, 4 fig, 11 tab. Contract No 14-01-0001-1289 OSW.

Descriptors: *Soil sealants, *Analytical techniques, *Waste water disposal, Brines, Lignins, Soil moisture, Permeability, Permeameters, Cost analysis, Cellulose, Additives, Research and development.
Identifiers: *Lignin derivatives, Sodium chromate, Alum, Carboxymethyl cellulose, Petroleum emulsions.

Materials to be used in making soils impermeable to concentrated brine for disposal by evaporation were studied. Roswell soil from New Mexico was rendered impervious by four classes of additives, namely, lignin derivatives gelled with sodium chromate or alum, carboxymethyl cellulose with alum, petroleum emulsions, and an attapulgite clay. Soil permeability was sensitive to moisture content. This relationship should be considered in research experiments with additives and in field installation procedures. The reproducibility of results in small permeameters was not as good as expected because of insufficient control of moisture levels. Permeability tests of longer duration need to be made before any major installation is contemplated. A graphical technique for comparing treatment costs and effectiveness is suggested. The additive cost for

reducing the seepage at Roswell to less than 6 inches per year at a brine depth of 20 feet by treating a 6-inch soil layer can be as low as $500 per acre. A graphical technique for comparing treatment costs and effectiveness is suggested. (Carstea-USGS)

A STUDY OF DEEP WELL DISPOSAL OF DESALINATION BRINE WASTE,
Dow Chemical Co., Freeport, Tex.
P. G. LeGros, C. E. Gustafson, G. L. Nevill, E. C. Majeske, and R. D. Mathews.
Offc of Saline Water Research and Development Progress Report No 456. June 1969. 259 p. OSW Contract 14-01-0001-1691.

Descriptors: *Brine disposal, *Brines, *Saline water, *Deep wells, *Injection wells, Waste disposal, Subsurface investigations, Desalination.
Identifiers: *Deep well disposal, Deep well usage, Geologic considerations, Desalting.

Seven inland U.S. communities were selected as examples for the design of deep well disposal facilities for the desalination waste brines. The water needs, the geological structures, and other pertinent data were accumulated for each of the seven communities. Actual values were used wherever available. Injection wells and surface equipment were designed for each community, and estimates were made of the cost of construction and operation of the designed disposal system in each. The developed costs vary from a low of 2.5 cents per 1000 gallons of product water at Arkansas City to a high of 35.1 cents at Fort Morgan. This spread in costs represents the expected ranges due to variations in geology, geography and plant size. (Gransee-Office of Saline Water)

ZINC RECOVERY FROM VISCOSE RAYON EFFLUENT,
R. S. Aston.
Ont Ind Waste Conf, Proc No 13, p 215-230, 1966.

Descriptors: Ion exchange, Evaporation.
Identifiers: *Recovery (Waste), *Zinc sulfate, *Rayon, *Man-made fiber production wastes, Zinc compounds, Sulfuric acid, Cationic exchange resins.

The recovery of Zn, in the form of $ZnSO_4$, by ion exchange was successfully applied to the treatment of effluent liquors from a viscose rayon plant. The resin used was Permutit Q, a cation exchanger of the sulfonated polystyrene type, operating in the H cycle and regenerated with H_2SO_4. The process is more effective than an evapn. process in reducing the Zn pollution content, since large vols. contg. a low concn, may be treated. The tech. and economic feasibility is enhanced at plants that produce different types of viscose yarn. At the Cornwall plant of Courtauls (Canada) Ltd., the Zn discharge to the river was reduced by 80%. (Livengood-North Carolina State Univ)

PRACTICAL ASPECTS OF THE DESIGN OF WASTE STABILIZATION PONDS,
W. D. Barlow.
Proc 9th Sth Munic Industr Waste Conf, p 65-70, 1960.

Descriptors: *Lagoons, *Domestic wastes, Waste water treatment, Industrial wastes, Neutrients, Bacteria, Algae, Treatment facilities, Test procedures, Metals.
Identifiers: *Finishing wastes.

Lagoons can be designed to provide complete treatment for any waste water, domestic and/or industrial, provided it contains the necessary nutrients and is free from substances which are toxic to bacteria or algae. The author discusses the basic processes involved; factors affecting the design and operation of the lagoon (particularly under conditions in North and South Carolina); performance of the lagoon, including methods of measurement; and precautions to be taken to avoid health hazards, pollution and other nuisance problems. In discussion, reference was made to lagoons used for treating mixed waste waters and 20-30 per cent of domestic sewage, and especially to the problems encountered which appear to be caused by toxic metals in the waste water. WATER POLLUTION CONTROL.

Ky Rev Stat Ann secs 224.010-224.130 (Supp 1968).

Descriptors: *Pollution, *Kentucky, *Water pollution control, *Standards, Waste treatment, Administrative agencies, Local governments, State governments, Damages, Permits, Control, Legal aspects, Legislation, Waste disposal, Fish, Fish stocking, Interstate compacts, Water pollution, Water pollution sources, Permits, Abatement, Water management, Water law, Water quality control, United States.

Kentucky has provided a program for the establishment and enforcement of standards concerning water pollution. A Water Pollution Control Commission is established to preserve the waters of the state for the use of the public, to protect fish and

wildlife, and to prohibit water pollution. The Commission shall issue permits providing for construction or modification of disposal systems. By regulating these permits, the Commission is able to control who has rights of disposal and how much they may dispose. The state is empowered to sue to recover costs for restocking and restoring fish and wildlife which are destroyed as a result of illegal disposal activities. The Ohio River Valley Water Sanitation Compact is accepted and enacted into law. This Compact provides for an interstate effort to establish standards and regulate pollution of the Ohio River Valley. (Darragh-Florida)
W70-01307

WATER POLLUTION CONTROL.
Ky Rev Stat Ann secs 224.010-224.040 (Supp 1968).

Descriptors: *Kentucky, *Water pollution, *Administrative agencies, *Water resources development, Federal government, Waste disposal, Waste water disposal, Planning, Legislation, Coordination, Water quality, Water pollution control, Standards, Regulation, Permits, Investigations, Benefits, Water treatment.

It is the policy and purpose of the state of Kentucky to conserve its water resources, to provide for the prevention of pollution, and to cooperate with all federal programs to these ends. To further these purposes, a Water Pollution Control Commission is established within the Department of Health. The Commission may exercise authority, power, and duties concerning: (1) furtherance of the aims of this act; (2) development of a comprehensive plan for control of pollution; (3) cooperation with all relevant federal agencies; (4) conducting studies relating to water pollution; (5) establishment of water quality standards; (6) establishment of rules and regulation for pollution control; (7) issuance of orders of abatement; (8) examination of all plans for construction of disposal systems; (9) regulation of permits for waste disposal; (10) conducting investigations; (11) institution of proceedings to force compliance; and (12) taking necessary action to secure the benefits available under the Federal Water Pollution Control Act. (Darragh-Florida)
W70-01308

WATER POLLUTION CONTROL.
Ky Rev Stat Ann secs 224.060-224.130 (Supp 1968).

Descriptors: *Waste treatment, *Pollution, *Kentucky, *Water pollution control, Administrative agencies, Local governments, Damages, Permits, Legislation, Interstate compacts, Waste disposal, Fish, Fish stocking, Standards, Regulation, Legal aspects, Water pollution, Water treatment, Water quality, Pollution abatement, Pollutant identification, Fish kill.

It shall be unlawful for any person to discharge any waste into the waters of the Commonwealth in contravention of the standards established by the Water Pollution Control Commission. No new source of discharge or any proposed change in any old source of discharge may be made without first obtaining a permit from this Commission. No establishment may be changed so as to cause a substantial increase in the discharge of waste without first obtaining a permit. If between meetings of the Commission the executive director finds that an emergency exists, he may ask the Governor to issue an appropriate order. Public hearings shall be held concerning the issuance of permits. Orders to control pollution will be issued at such hearings. Where injury, death, or destruction results to fish from pollution activities, the persons responsible for such pollution shall be liable for the cost of restocking or replenishing such fish. The Ohio River Valley Water Sanitation Compact, which was adopted to reduce and control pollution of the Ohio River, is approved and enacted into law. (Darragh-Florida)
W70-01309

SAMPLING FOR WATER POLLUTION.
Va Code Ann 29-35.1, 29-35.2 (1969).

Descriptors: *Virginia, *Water pollution, *Pollution abatement, *Water pollution control, Water pollution treatment, Pollutant identification, Analytical techniques, Chemical analysis, Cities, Streams, Sampling, Administrative agencies, Water law, Legal aspects, Legislation.

Any game warden may be requested by a member of the governing body of a county, city, or town to take samples from any stream believed to be polluted. The warden sends the sealed sample and a report of pertinent circumstances to the State Water Control Board. If on chemical analysis the water is found to be polluted, the Board has further studies and analyses performed to determine the nature and extent of such pollution and the most effective measures for controlling the same. (McDonough-Florida)

WATERS OF THE STATE: REGULATION OF INDUSTRIAL ESTABLISHMENTS.
Va Code Ann secs 62.1-28 thru 62.1-30 (1968).

Descriptors: *Virginia, *Water pollution, *Industrial wastes, *Water pollution control, Abatement, Pollution effects, Non-structural alternatives, Pollutants, Water pollution treatment, Water quality control, Water pollution sources, Wastes, Pollution abatement, Disposal, Legal aspects, Legislation, State governments.

Any owner of an industrial establishment which, in its operation, would cause pollution of the state's waters must provide facilities for treatment of industrial wastes or take such measures as will prevent pollution before operation of the establishment may commence. Any owner proposing to discharge industrial wastes or otherwise alter the physical, chemical, or biological properties of state waters must secure a permit from the State Water Control Board. Any owner who handles, stores, distributes, or produces other wastes shall, upon request of the Board, install facilities or adopt procedures approved by the Board as are necessary to prevent the discharge or escape of pollutants into state waters. (Kelly-Florida)
W70-01319

PROHIBITION OF WATER POLLUTION.
R I Gen Laws Ann secs 46-12-4 thru 46-12-7 (Supp 1968).

Descriptors: *Rhode Island, *Water pollution control, *Administrative agencies, Water pollution treatment, Wastes, Sewage, Sewage treatment, Pollution abatement, Water quality control, Investigations, Industrial wastes, Water pollution sources, Water pollution effects, Legislation, Legal aspects, Administration, Supervisory control (Power).

No person may cause or place sewage in a location likely to cause pollution of the state's waters. The statute prohibits construction or modification of sewage disposal systems, activities increasing the volume or strength of present sewage discharge, and construction of any industrial or commercial establishment whose operation may result in discharge of sewage, unless these actions have the approval of the Director of the Department of Health. If the Director believes that a violation of the chapter is taking place, he must initiate an investigation. Evidentiary hearings are required before violation may be found to exist. The Director may employ such professional or expert services as he requires to aid in investigation or prosecution of a suspected violation. (Kelly-Florida)
W70-01328

ADOPTION OF APPROVED POLLUTION PREVENTION SYSTEMS.
RI Gen Laws Ann secs 46-12-8 thru 46-12-15 (Supp 1968).

Descriptors: *Rhode Island, *Water pollution control, *Adoption of practices, *Pollution abatement, Sewage treatment, Water pollution treatment, Project planning, Planning, Water quality control, Water pollution effects, Water pollution sources, Administrative agencies, Administration, Public health, Legal aspects, Legislation, Supervisory control (Power).
Identifiers: Penalties (Criminal).

The Director of the Department of Health may order any person who is polluting the waters of the state to adopt a practicable and reasonably available system or means to prevent such pollution. If more than one system is available, an option may be given. The time limit for adoption of such system is fixed by the Director, but is subject to modification upon application by the person subject to the order. The operation of a pollution control system approved by the Director is sufficient to constitute compliance with all orders issued by the Director during his term in office. Violation of an order of the Director is punishable by fine and/or imprisonment; each day of violation is considered a separate offense. The Director has the power to inspect and to make orders regulating the means and devices utilized by all vessels and land installations for handling petroleum, gasoline, kerosene, tar, oil, or any mixture thereof for the purpose of preventing the discharge or escape of such substances into the waters of the state. (Kelly-Florida)
W70-01329

DISCHARGE OF SEWAGE.

RI Gen Laws Ann secs 46-12-24, 46-12-25, 46-12-33 (Supp 1968).

Descriptors: *Rhode Island, *Sewage treatment, *Water pollution control, *Pollution abatement, Disposal, Wastes, Local governments, State jurisdiction, Construction, Construction costs, Cost allocation, Grants, Federal government, Administrative agencies, Administration, Water pollution treatment, Water pollution sources, Legislation, Legal aspects.

The Director of the Department of Health may consult with and advise any person who discharges or empties sewage into the waters of the state as to the best method to prevent such sewage from polluting those waters. At the Director's request, any person now having a sewer or drain discharging into state waters or upon the beaches thereof must submit a statement describing all such sewers and drains owned or controlled by him together with a description of any works or methods employed to purify or otherwise alter the character of the sewage. Such statements shall be confidential unless made by a municipal corporation. The Director is authorized to grant state funds to municipalities, districts, and agencies for the construction of necessary facilities to prevent the discharge of untreated or inadequately treated sewage into state waters. The grants can be made only for projects which qualify under the Federal Water Pollution Control Act, and only when the director has been informed of project specifications. (Kelly-Florida)
W70-01330

WATER POLLUTION CONTROL.
RI Gen Laws Ann secs 46-12-30, 46-12-32 (1956).

Descriptors: *Rhode Island, *Water pollution control, *Impaired water quality, *Cities, Financing, Administrative agencies, Regulation, Control, Legislation, Local governments, State governments, Ice, Legal aspects, Water quality control, Water pollution, Public health, Standards, Water quality, Planning.
Identifiers: Drinking water, Ice supply.

No person shall be held to have violated the provisions of this chapter where the sole damage caused by him is the rendering unsuitable for drinking purposes or ice supply the waters polluted by him. Town and city councils may expend money to pay

for pollution control in their town or city, and may raise such money by the issue of interest-bearing notes. However, before the issuance of such notes, all plans and specifications for water pollution control must be submitted to and receive the approval of the State Department of Health. (Marsee-Florida)

THE ABATEMENT OF POLLUTION.
Council of Economic Advisors, Washington, D.C.

Controlling Pollution the Economics of a Cleaner America, edited by M I Goldman, Englewood Cliffs, Prentice-Hall, p 171-175, 1967. 5 p.

Descriptors: *Waste treatment, *Pollution abatement, *Federal Government, *Water pollution, *Water quality, Effluents, Waste discharge, Population, Air pollution, Sewerage, Rivers, Fishing, Agriculture, Economics, Economic incentives.
Identifiers: *Water Pollution Control Act, Garbage, Junk automobiles.

This article indicates the federal government's view of the problem of pollution abatement and its current and future role in such abatement. Government already provides for waste disposal and collection and disposal of water-borne wastes. An incentive system to abate waste discharges is proposed as a further measure in the form of taxes or charges levied on a pollutor. Water quality standards must be federally enforced if such pollution endangers the health or welfare of the public. Control agencies should then propose, and legally insist on, remedial measures for such situations. The recent establishment of the Water Pollution Control Administration is expected to facilitate these goals and the act which established the Administration also provides for technical assistance for waste treatment facilities, although financial aid has been limited. The federal government's role should be shouldered by localities, states, corporations and individuals if pollution abatement is to be successful. (Murphy-Rutgers)

MANAGING WATER QUALITY: ECONOMICS, TECHNOLOGY, INSTITUTIONS,
Resources for the Future, Inc., Washington, D.C.
Allen V. Kneese, and Blair T. Bower.
Baltimore, Maryland, The Johns Hopkins Press, 328p, 1968.

Descriptors: *Costs, *Government, *Resource allocation, Water quality, Sewage, Aesthetics, Industrial wastes, Filtration, Aeration, Effluents, Reservoirs, Computers, Capital costs, Damages, Biochemical oxygen demand, Degradation, Marginal costs, Dissolved oxygen, Groundwater aquifers, Legal aspects, Organic wastes, Chloride, Delaware, Domestic wastes, Irrigation thermal properties, Recreation.
Identifiers: *Potomac, Damage functions, Degradable wastes, Petroleum refineries.

The book attemps to determine: the quality of water we want to maintain in our watercourses, both surface and underground; the most efficient system of management measures for achieving the specified patterns of water quality and the best institutional or organizational arrangements for managing water quality. It makes use of the economic theory of resources allocation, and case studies of a number of actual situations are presented. The study begins by providing background information on some scientific and technological aspects of water quality. Major wastes, their effects and cost of treatment are analyzed, as well as factors influencing their generation. The theory of economic resource allocation as related to the problems of costs, value and public policy are discussed. A major section focuses on the concept of regional water quality management and the criteria for an economically optimal system of waste disposal. The experiences of some countries are outlined. The last section attempts to draw out the implications of points made for policy in the United States. (Murphy-Rutgers)

Joe B. Stevens.
Water Resources Research, Vol 5, No 4, p 908-909, August 1969. 2p, 2 ref.

Descriptors: *Water pollution control, *Water pollution, *Benefits, Fishing, Demand, Supply, Recreation demand, Social values, Costs, Pricing.
Identifiers: *Recreation benefits, Angler behavior, Consumer surplus, Willingness to pay, Gross social value, Net social value, Producers' surplus, Optimum pricing.

Stevens in this reply concedes that his attempt to separate supply and demand functions for anglers in his fishery case was unsuccessful. Having made certain amendments he suggests that the difference between his argument and Burt's is not great. As to the matter of gross or net measures of social value, Stevens claims that it all depends on when one deducts the costs of pollution control. Stevens is in basic agreement with Burt's suggestion that producers' surplus as well as consumers' surplus be considered in determining net social value of recreation resources. He suggests that the literature in the area is in need of an expanded form of the model which Burt presents. As an inducement for Burt to expand his model, Stevens poses three problems for consideration. The first is the meaning of producers surplus when government, rather than profit seekers, produces the service. Secondly, how is optimum pricing defined when the cost relationship in its marginal form is declining and approaches the quantity axis asymptotically. Third, under what conditions would consumers' plus producers' surplus overestimate the value of recreation resources relative to competing uses where market prices are more readily obtainable. The author, as an addendum, points out an error in his original article in his estimates of income elasticities. (Loeb-Rutgers)

RECENT RESULTS FROM A MATHEMATICAL MODEL OF WATER POLLUTION CONTROL IN THE DELAWARE ESTUARY,
Department of Health, Education, and Welfare, Philadelphia, Pa.
Robert V. Thomann.
Water Resources Research, Vol 1, No 3, p 349-359, Third Quarter 1965. 11p, 4 fig, 1 tab, 4 ref.

Descriptors: *Mathematical models, *Water pollution control, *Water pollution, Mathematical studies, Environment, Systems analysis, Dissolved oxygen, Water quality control, Water quality, Temperature.
Identifiers: *Delaware Estuary, External environment, Waste discharge.

This paper presents the basic principles involved in the construction of a mathematical model of dissolved oxygen in the Delaware Estuary. An attempt is made to introduce these principles with a minimum of mathematics and then to indicate how the mathematical model can be used to generate useful water quality control information. As such, the basic concepts of systems analysis and optimum (least-cost) water pollution control are presented. The basic motivation for the approach is provided by the Public Health Services' Delaware Estuary Comprehensive Study. This investigation is charged with developing a comprehensive water pollution control plan for water quality improvement in the Delaware Estuary. The basic objectives of formulating the Delaware system in mathematical terms were (1) to develop an evaluation of the cause and effect relationships between the external environment and the quality of water and (2) to utilize a portion of this evaluation to develop a rational approach to the attainment of various water quality goals. Both these objectives are indispensable to the techniques of comprehensive planning. (Loeb-Rutgers)

STUDIES ON THE LONGITUDINAL MIXING IN OPEN CHANNELS AND ITS EFFECT ON THE RATE OF THE B.O.D. REACTION IN AQUEOUS MEDIA (IN CZECH),
Hydraulic Research Inst., Prague (Czechoslovakia).
A. Nejedly, and J. Pelz.
Summaries in English and Russian. Vyzkumny ustav vodohospodarksy, Prace a studie, No 112, 1964. 116 p.

Descriptors: *Mixing, *Biochemical oxygen demand, Self-purification, Turbulence, Biochemistry, Decomposing organic matter, Laminar flow, Turbulent flow, Velocity, Flumes, Laboratory tests, Hydraulics equipment, Hydraulic models.
Identifiers: Longitudinal mixing.

It is pointed out that high values of the deoxygenation coefficient occur not only in small streams but also in large rivers. Therefore, the approach utilizing the indirect relationship of the deoxygenation coefficient to the depth of water is not generally valid. The authors submit their own proposal for a possible explanation of the difference between the rate of the BOD reaction under laboratory and field conditions. Under laboratory conditions, all particles of the aqueous medium are subjected to incubation simultaneously and for the same duration of time and therefore cannot interact. The unlimited body of water under stream conditions is subjected to longitudinal mixing by which particles of water containing organic matter in different states of biochemical change and organisms in different states of development can interact. Longitudinal mixing was simulated under laboratory conditions interact. Longitudinal mixing was simulated under laboratory conditions by mixing samples with different ages of incubation. The results proved the assumption. The study also included a hydraulic explanation of longitudinal mixing which was characterized by the dimensionless number, (increment of dispersion)/ (increment of mean detention period). The behavior of this parameter as ascertained in laboratory flume tests is very similar to the BOD decomposition rate changes as stated above. (Novotny-Vanderbilt)

WIND INFLUENCE UPON COOLING WATER CIRCULATION,
Waterloopkundig Laboratorium, Delft (Netherlands).
G. Abraham, and R. Koudstaal.
Journal of Power Division, ASCE, Vol 95, No PO1, p 63-75, Mar 1969. 6 fig, 4 tab.

Descriptors: *Electric power production, *Water cooling, *Winds, Flow, Temperature.

A field investigation performed in a cooling water circuit formed by a wide canal of an existing power plant shows the important influence of wind upon cooling water circulation. With the aid of measured float tracts a coefficient n could be estimated indicating which part of the cooling water, leaving the outlet channel is flowing directly to the inlet channels. The coefficient n can be found by the relationship (T sub in) - (T sub o)= (n/ (1 - n)) (T sub A - T sub in) where T sub in is the temperature of the cooling water in the plant directly behind the inlet, T sub o is the background temperature, T sub A is the temperature at some point A which can be found by (T sub A)= 1 - (Q sub ex/Q sub c) (T sub in+ delta T)+ (Q sub ex/Q sub c) T sub o where Q sub ex is the quantity of water exchanged through the interface, delta T is the rise in temperature of cooling water within the plant and Q sub c is quantity of cooling water discharged per unit time. Values of n of 0.4 to 0.7 have been found. For the power plant under consideration the relationship was compared with available records of the inlet

temperature. An adequate starting point was given to determine if the existing power plant can be enlarged without creating difficult conditions for the supply of cooling water. (Upadhyaya-Vanderbilt)

CHEMICAL POLLUTION OF THE SEA AND THE LAW (FRENCH),
Montpellier Univ. (France). Faculte de Droit.
J. P. Queneudec.
Revue Internationale d'Oceanographie Medicale, Vol XIII-XIV, p 217-230, 1969. 19 ref.

Descriptors: *Legal aspects, *Oil, *Water pollution, *Water pollution sources, Oceans, Ships.
Identifiers: Oil spills, Underwater oil deposits, Hydrocarbons.

Without being completely neglected, chemical substances which pollute the oceans have until the present been the occasion for the establishment of few laws, except in the case of the hydrocarbons. Pollution by hydrocarbons has been the object of detailed national and international rules covering pollution from both the cleaning of tanks on ships and the exploitation of underwater oil deposits. The author notes that the pollution from underwater oil wells is more easily dealt with by the law than oil waste from ships because of the traditional liberty of the high seas. (Tyner-Washington)

MINERALIZED SPRINGS AND THEIR EFFECT ON UTAH'S WATER SUPPLIES,
Utah Water Research Lab., Logan.
J. H. Milligan.
In: Groundwater Development in Arid Basins - Symposium, Utah State University, 1967, Proceedings. Utah State University, Logan, p 43-50, 1967. 8 p, 2 fig, 11 ref.

Descriptors: *Impaired water quality, *Streams, *Groundwater, *Water quality control, *Springs, Salinity, Great Basin, Irrigation, Utah, Water mangement, Mineral water.
Identifiers: *Marine sediments.

The study's objectives were to inventory Utah's highly mineralized springs, their quantities and qualities, and to determine their potential contaminating effect on regular water supply and possible means of control. A good water supply can be reduced just as effectively by lowering its quality as by reducing its quantity. Most of the mineralized springs lie in the Great Basin and are associated with major fault patterns. They bring dissolved salts to the surface from old marine sediments which antedate more recent uplifting and folding. Water from some of these springs merely spreads out over the desert, evaporates and leaves dry salt beds. Others flow into surface streams, thus lowering the quality. Fortunately, only a few of the springs sampled seriously impaired the quality of surface water supplies. However, it is conjectured that these may also be an unknown effect on groundwater supplies. The effect on surface waters is likely to increase as more water is diverted for use above the springs. The construction of dams to control the flow of important surface waters could help control the rate of contamination during the irrigation season. (Crouse-Arizona)

CRAZED RESIN FILTRATION OF COMBINED SEWER OVERFLOWS.
Hercules Powder Co., Cumberland, Md. Allegany Ballistics Lab.

Water Pollution Control Research Series, DAST-4, Oct 1968. 78 p, 19 tab, 26 fig, 14 ref, 2 append. FWPCA Program 11020, Contract No 14-12-39. Available from the Clearinghouse as PB 187 867, $3.00 in paper copy, $0.65 in microfiche.

Descriptors: Pollution control, Pre-treatment (Water), *Filters, *Filtration, Separation techniques.
Identifiers: *Resin, *Crazing, Volume Reduction, Pollutant Concentration.

The feasibility of developing a self-cleaning, self-adjusting filtering device constructed of cylindrical structures of fibers laid down in predetermined patterns by a winding process and bonded in place by resins was investigated. The permeability of the structure is imparted by a mechanical cracking of crazing of the resin. Filtration runs showed a 62 percent reduction of suspended solids in the filtrate. However, sustained runs could not be realized. The self-cleaning aspect was not demonstrated.

REDUCTION OF GROUNDWATER INFILTRATION INTO SEWERS BY ZONE PUMPING AT MERIDIAN, IDAHO.
Hoffmann and Fiske, Boise, Idaho.

Water Pollution Control Research Series DAST-9, 1969. 28 p, 13 fig. Available from the Clearinghouse as PB 187 868, $3.00 in paper copy, $0.65 in microfiche. FWPCA Program 11020, Grant 29-IDA-2.

Descriptors: *Infiltration.
Identifiers: Volume reduction, Surcharging, *Zone-pumping, *Groundwater infiltration.

The reduction was investigated of goundwater infiltration into sanitary sewers by pump down of the water table in the sewer area assuming the geology, precipitation and local irrigation practices were ameanable to rapid and wide zones of influence. The water table was lowered below the sewer and reduced the volume of flow to the treatment plant. The water table was not lowered uniformly. For 140 square blocks 70 pump units would be required at an average cost of $40,000 per unit with a total power bill of $122.50 per day. This is not economically favorable when compared with other corrective measures.

WATER POLLUTION CONTROL.

Ky Rev Stat Ann secs 220.580-220.990 (1963).

Descriptors: *Kentucky, *Water pollution control, *Water conservation, *Water pollution, Waste disposal, Legislation, Legal aspects, Rivers, Streams, Administrative agencies, Sewage, Industrial wastes, Wastes, Water supply, Treatment facilities, Administration, Federal government, Investigations, Specifications, Permits, Regulation, Pollution abatement.
Identifiers: *Water quality standards, Penalties (Criminal).

Included among the terms defined relative to water pollution control are water, pollution, sewage, industrial wastes, other wastes, sewer system, treatment works, and disposal system. It is the declared policy of the state to conserve the state's waters for specified purposes, to provide an effective program of pollution control and to provide for cooperation with state and federal agencies in carrying out the foregoing objectives. The Water Pollution Control Commission is created to carry out the provisions of this act, and its administration is provided for. Included among the specified powers and duties of the Commission are those of: (1) supervising the administration of this act; (2) developing a pollution control program; (3) implementing the program once it is developed; (4) setting water quality standards; (5) adopting regulations necessary to accomplishing the purposes of this act; (6) issuing permits for waste discharge; and (7) enforcing the provisions of this act and regulations adopted hereunder. The Commission is further authorized to perform certain acts to secure to the state the benefits of the Federal Water Pollution Control Act. It is made unlawful for any person to discharge waste into state waters in contravention of the Commission's water quality standards or to do so without a Commission permit. (Keith-Florida)

WATER POLLUTION CONTROL.

Ky Rev Stat Ann secs 220.580-220.600 (1963)

Descriptors: *Kentucky, *Water pollution control, *Water conservation, *Water pollution, Waste disposal, Legislation, Legal aspects, Administrative agencies, Rivers, Streams, Lakes, Ponds, Reservoirs, Springs, Water wells, Marshes, Surface waters, Subsurface waters, Sewage, Water supply, Water conservation, Wildlife, Recreation, Pollution abatement, Administration, Federal government.
Identifiers: *Pollution prevention.

For the purposes of this act the following terms are defined in the following manner: 'water' means all rivers, streams, creeks, lakes, ponds, reservoirs, springs, wells, marshes, and other bodies of surface or underground water, natural or artificial; 'pollution' means the discharge of waste in such condition or quantity as may contaminate state waters to the detriment of any legitimate use; 'sewage' means water-carried human or animal wastes and industrial wastes; and 'disposal system' means a system of waste disposal. It is the declared policy of the state to: (1) conserve state waters for public water supplies, wildlife propagation, and for agricultural, industrial, recreational, and other legitimate uses; (2) provide a program for the prevention, abatement, and control of pollution; (3) provide effective means for the execution and enforcement of such a program; and (4) provide for cooperation among state and federal agencies in carrying out these objectives. It is the purpose of this act to safeguard from pollution the uncontaminated waters of the state, to prevent further pollution, and to abate existing pollution. The Water Pollution Control Commission is created for the purpose of carrying out the provisions of this act; its administration is expressly provided for. (Keith-Florida)

WATER POLLUTION CONTROL.

Ky Rev Stat Ann secs 220.610-220.990 (1963).

Descriptors: *Kentucky, *Water pollution control, *Waste disposal, *Water pollution, Legislation, Legal aspects, Administrative agencies, Treatment facilities, Water conservation, Pollution abatement, Administration, Federal government, Investigations, Research and development, Construction, Specifications, Permits, Jurisdiction, Regulation, Financing, Supervisory control (Power).
Identifiers: *Water quality standards, *Pollution prevention, Penalties (Criminal).

The Water Pollution Control Commission is empowered to: (1) supervise the administration and enforcement of this act and regulations promulgated hereunder; (2) develop a program for the prevention, control, and abatement of water pollution; (3) encourage and conduct studies, investigations, research, and demonstrations to enable it to

lisseminate information relating to water pollution; (4) establish water quality standards for waters according to their particular uses; (5) adopt regulations for the prevention, abatement, and control of pollution as it deems necessary for the accomplishment of the purposes of this act; (6) issue permits for the discharge of wastes and for the operation of disposal systems and treatment works; (7) pass on all plans and specifications for the construction of proposed systems and works; and (8) take such action as is necessary to secure to the state the benefits of the Federal Water Pollution Control Act including cooperation, fund acquisition, project approval, and participation in federal programs. It is unlawful for any person to discharge wastes without a permit or to construct a disposal system without a permit. The Commission holds public hearings before adopting regulations of general applicability; the manner in which such hearings will be conducted is set out. (Keith-Florida)

INCORPORATION OF SANITATION DISTRICTS.
Va Code Ann secs 21-154, 21-168, 21-175 (1960).

Descriptors: *Virginia, *Tidal waters, *Water pollution control, Public health, Water pollution effects, Pollutants, Disposal, Environmental sanitation, Impaired water quality, Treatment facilities, Legal aspects, Legislation, Surveys, Investigations, Supervisory control (Power), Water pollution treatment, Pollution abatement.

Each sanitation district heretofore or hereafter created in the state is incorporated by this act and shall be known as a commission. Each commission has all the powers of a private corporation. In addition, each commission has as its primary purposes the protection of state tidewaters from pollution and the improvement of conditions affecting the public health and natural oyster beds, rocks, and shoals. Each commission may enter on any lands or waters for the purpose of making surveys, borings, soundings, or other examinations and may make and enforce rules or regulations for conducting its affairs. The State Health Commissioner must approve any method used by the commission for treating and disposing of sewage and industrial wastes so as to prevent the pollution of the tidal waters of the district. PUBLIC UTILITIES AND POLLUTION PREVENTION.
Va Code Ann secs 15.1-292, 15.1-301, 15.1-307, 15.1-318, 15.1-320, 15.1-333 (1964), as amended, (Supp 1968).

Descriptors: *Virginia, *Public utilities, *Water pollution control, *Leases, Cities, Local governments, Governments, Water supply, Water works, Utilities, Electric power, Condemnation, Right-of-way, Ducts, Electrical power production, Powerplants, Disposal, Contracts, Sewage disposal, Ventilation, Pumping plants, Treatment facilities, Sewers, Pollution abatement, Water pollution, Water pollution sources, Costs, Sanitary engineering.

The governing body of every county, city, and town may acquire or establish water works, gas works, electric plants, sewage disposal systems, and other public utilities and may acquire the land and rights of way necessary for such purpose. Such governing body may also prevent water pollution by construction of drains, sewers, and public ducts. Absent public sewers, any landowner may establish and maintain a sewer from his land, along any public way, to the nearest natural watercourse. No rights of any city or town to its water front property, gas, water, and electric works shall be sold except by special ordinance. No lease of such public property shall be granted for more than thirty years. Any such lease may provide that upon termination the plant as well as the property shall become the property of the city or town. Any two or more counties, cities, or towns may enter agreements concerning sewers, pumping stations, ventilation stations, treatment plants, or any other such works. (Smith-Florida)
W70-01622

WATER POLLUTION CONTROL BY MUNICIPALITIES.
Va Code Ann secs 15.1-854 thru 15.1-856, 15.1-858, 15.1-867 (1964).

Descriptors: *Virginia, *Water pollution control, *Regulation, *Local governments, Cities, Governments, Inspection, Water supply, Water distribution (Applied), Water transfer, Sewers, Sanitary engineering, Culverts, Drains, Sewerage, Septic tanks, Swimming pools, Lakes, Pollution abatement, Water pollution, Sources, Diseases, Weeds, Snow, Stagnant water, Costs, Municipal water, Legislation, Supervisory control (Power).

A municipal corporation may regulate and inspect the following, whether public or private: water supplies; the production, preparation, transmission and distribution of water; the sanitation of systems, facilities and equipment which produce, prepare, transmit or distribute water; sewers; culverts; drains; sewerage; disposal and treatment systems; septic tanks; swimming pools; lakes; and other natural or artificial waters operated by clubs and associations. Such municipal corporation may adopt regulations deemed necessary to prevent the pollution of public or private waters, to prevent the transmission or distribution of impure water, to require the use of septic tanks where sewers are not available, to prevent the operation of sewers and drains which may cause pollution or the spread of disease, and to prevent the use of swimming pools or lakes when such waters are found to be polluted or dangerous. A municipal corporation may compel the abatement or removal of all nuisances from private or public property including weeds, snow, unsanitary or unhealthy substances allowed to accumulate, stagnant water and unsanitary structures. If the owner fails to so remove any nuisance, the municipal corporation may do so at the owner's expense. (Smith-Florida)

FEDERAL ROLE IN POLLUTION CONTROL,
James L. Agee.
Amer Water Works Assoc J, vol 61, no 10, p 499-503, Oct 1969, 5 p.

Descriptors: *Water pollution control, *Water quality, *Waste disposal, *Waste treatment, Legal aspects, Federal government, Administrative agencies, Water supply, Potable water, Public health, Sewage treatment, Construction, Reservoirs, Water Quality Act, Legislation, Financing, River basins, Investigations, Industrial wastes, Thermal pollution, Permits, Watersheds (Basins), Water pollution effects, Standards, Water utilization, Interstate rivers.

The pollution control concept has broadened from protection against public health hazards alone to an awareness that water is polluted and that action is needed whenever any of man's desired water uses are inhibited by its quality. This expansion began with the Federal Water Pollution Control Act of 1956, which provided for research and training. It continued with passage of the 1965 Water Quality Act which required the establishment of water quality standards on all interstate waters. This expansion culminated in the Clean Waters Restoration Act of 1966, which provided financing to achieve the goal of clean water. The agency organizational changes which have accompanied this expanding concept are noted. The purpose of the federal effort is to enhance the quality and value of our nation's water resources through the prevention, control, and abatement of water pollution. Examples are given of how this purpose is manifested in federal policy: quality standards should be designed to enhance the quality of water; all waste discharged should receive best practicable treatment; and water whose quality exceeds the standards should not be degraded arbitrarily. Current issues in and proposed legislation regarding pollution control are discussed; several new technical developments in the field are divulged. (Keith-Florida)

ECONOMIC ANALYSIS IN THE ALLOCATION OF THE FEDERAL BUDGET TO RESOURCE DEVELOPMENT,
Arizona Univ., Tucson.
M. M. Kelso.
Economics and Public Policy in Water Resource Development, edited by S C Smith, and E N Castle, Ames, Iowa State University Press, p 56-81, 1964. 26 p, 28 ref.

Descriptors: *Water resource development, *Benefits, *Costs, *Budgeting, *Welfare economics, *GNP, *Cost allocation, Economic evaluation, Economic analysis, Taxes, Economic efficiency, Government supports, Watershed, Prices, Input-output analysis, Risks, Irrigation.
Identifiers: *Decision making, Maximized dollar value, Net gains, Flood Control Act.

This article examines the present stage in the developments of defining and organizing the concepts and measurements needed in water resource development at the Federal level. Covered under this category are almost all federal water and watershed development proposals by combinations of congressional and agency practice. It is proposed that in economic evaluation among alternative projects, a welfare maximum is unattainable. Such alternatives may be ordered by way of the criterion 'enhancement of national income,' which is, in turn, an outcome of enhancement of economic efficiency. An appropriate model to serve the needs of the criteria of benefits and costs must include the present worth of net gains, the restraints on federal funds, the opportunity costs of federal funds, and some value for 'pure benefits'. In addition, the model will include such elements as measurement, market prices, imputed values, uncertainty, the rate of discount, and net prime benefits values. Financial and budgetary restraints are included from the viewpoint of opportunity costs in their

relation to federal resource policy. (Murphy-Rutgers)

FISCAL POLICY AND EFFECTS OF GOVERNMENT PURCHASES: AN INPUT-OUTPUT ANALYSIS,
Wayne State Univ., Detroit, Mich.
Karl W. Roskamp.
Public Finance, Vol 24, No 1, p 33-47, 1969. 15 p, 4 tab.

Descriptors: *Input-output analysis, Expenditures, Leontief models, Taxes.
Identifiers: *Fiscal policy, *Government purchases, Walrasian general equilibrium, Short run policy, West Germany, Budget balance, Factor incomes, Income effects.

In this paper an effort is made to trace the effects of changes in the composition of government expenditures given the structure of production of an economy. The author's particular interest is in the effects of changes in government purchases of goods and services. Ideally this topic should be studied at the micro level. It would be desirable to investigate the effects of government purchases on individual firms and households. The Walrasian general equilibrium system would be the suitable framework for such a study. However, such a system is not operational and due to its size and complexity it cannot be handled with the available computing facilities. The author makes use of a more aggregate but operational model, the Leontief input-output model. The Leontief input-output model reflects the inter-industry relationships of an economy. If the model is sufficiently large it can provide detailed information on direct and indirect effects of fiscal measures which should be useful for short run policy purposes. This type of model who adopted to investigate the effects of changes in government purchases. Such types of models have long been used in the water area. Recently, they have been incorporated in studies dealing with water in the Western states and the economic effects of changes in 'the water sector' via government investment decisions can be traced. (Loeb-Rutgers)

AN EMPIRICAL TEST FOR DECISION RULE,
Michigan State Univ., East Lansing.
Frances M. Magrabi.
Journal of Consumer Affairs, Vol 3, No 1, p 41-51, Summer 1969. 11p, 2 tab, 6 ref.

Descriptors: *Decision making, *Planning, Project planning, Economic justification.
Identifiers: *Decision rule, Decision model, Lexicographic ordering, Choice.

This paper describes a study undertaken for the purpose of identifying decision rules which are consistent with actual choice. A model of a partial decision system was formulated which included a specification of the elements of the system and the source of their properties. However, it left unspecified those which could convert it into a closed system, that is, one in which choice of an element is a logical consequence. Choice was then made to depend on a decision rule, for which omitted relationships could be inferred. On the basis of some assumptions concerning relevant dimensions and their appropriate scales for measurement, a test was constructed in which some inferences concerning the decision rule could be made from the choices of respondents. In the first section the decision model is stated; in the second section the instrument used in collecting data is described. Section three summarizes conclusions and points out some implications of the results with respect to the model. Such models might be applied to the water area to aid in planning and investment decisions in the context of selecting projects on the basis of benefit-cost criteria. (Loeb-Rutgers)

CHOICE OF ADJUSTMENT TO FLOODS,
Chicago Univ., Ill.
Gilbert F. White.
Chicago, University of Chicago, 1964. 150 p.

Descriptors: *Flood plains, *Management, *Planning, Technical feasibility, Economic efficiency, Timing, Flood damage, Interest rates, Costs, Benefits, Capital, Flood proofing, Insurance, Cost-benefit analysis, Cost sharing, Land use, Flood protection.
Identifiers: *Flood adjustments, *La Follette (Tenn), Social benefits, Stage-demand curves.

This is an examination of conditions in which managers of flood plain property chose among eight possible adjustments to floods. Factors affecting the path which adjustment takes are analyzed along with the technical feasibility of each. A detailed analysis is given to evaluating the economic efficiency of each adjustment process for different interest rates and flood frequency assumptions. Net benefits, residual losses plus costs, cost-benefit ratios and operating capital ratios are computed for the various adjustments. The differences between public and private adjustments and the importance of timing are also evaluated. It was found that there were few regularities in the choices preferred by private managers. The character of the decision made by the private manager is guided by three different factors and methods are suggested in which the community can affect these factors in order to reduce flood losses. (Loeb-Rutgers)

ECONOMIC EVALUATION OF LAND DRAINAGE WORKS,
Trent River Authority (Gt. Brit.).
M. Nixon.
River Engineering and Water Conservation Works, edited by R B Thorn, London, Butterworth and Co, Ltd., p 47-51, 1966. 5 p, 6 ref.

Descriptors: *Land-drainage works, *Economic evaluation, *Cost-benefit analysis, Costs, Decision-making, Maintenance costs, Capital, Indirect benefits, Intangible benefits, Flood damage, Economic life, Monetary value, Flood protection, Conservation.
Identifiers: *National interests.

The five objectives of land drainage works are given followed by an explanation of the direct and indirect benefits associated with such a project. The concept of the cost/benefit ratio in economic evaluation is explained. This necessitates a monetary assessment of the accruing benefits which calls for an understanding of the concept of economic life. The most economically sound way of assessing the benefits from land drainage works is presented for direct, indirect, and intangible benefits. Care should also be taken to include maintenance costs and the deficiencies of economic evaluations. Related to this last point, arguments against the use of cost-benefit analysis are presented. (Murphy-Rutgers)

ENGINEERING AND ECONOMICS IN PROJECT PLANNING,
Stanford Univ., Calif.
Ray K. Linsley.
Economics and Public Policy in Water Resource Development, edited by S C Smith, and E N Castle, Ames, Iowa State University Press, p 93-103, 1964. 11 p, 4 fig, 6 ref.

Descriptors: *Engineering, *Economics, *Project planning, *Irrigation, *Frequency analysis, *Risks, *Statistics, Safety, Economic efficiency, Costs, Benefits, River basins, Flood control, Time, Random process, Dams spillways, Watersheds, Water quality.
Identifiers: *Climatic trend, Power projects.

This article views engineering and economics as the essential features of project planning. Effective engineering will result in satisfying the requirements of safety, efficiency, economy, and esthetics. Engineering design techniques and economic principles are discussed as applied to water-project planning. In this planning there are substantial differences in costs and benefits among equally acceptable designs. Equal uncertainties exist in the evaluation of the economic consequences of these projects. A systematic approach is called for in analyzing the various principles of design in water projects to assure that all possible alternatives are considered. Basic data must be collected on all aspects of water planning and better use must be made of this data. Research programs and education programs in new methodology are urgently needed to fulfill these goals. All project evaluation should include analysis of the probable effect of unavoidable uncertainties on the relation of benefit to cost to insure that the final decision on feasibility is made with complete knowledge of the probability that the decision could be wrong. (Murphy-Rutgers)

Stanford Univ., Calif.
Hubert Marshall.
Economics and Public Policy in Water Resource Development, edited by S C Smith, and E N Castle, Ames, Iowa State University Press, p 403-423, 1964. 21 p, 38 ref.

Descriptors: *Planning, *Decision making, *Economic analysis, *Risks, *Interest rate, *Economic efficiency, *Water resources development, Investment, Income, Cost-benefit analysis, Dams, Floods, River basins, Erosion, Navigation, Taxes, Optimization, Value.
Identifiers: *Rational choice, *Balance of interest, Power output.

This article deals with the model of rational choice in decision-making in water resources planning. The ideal of such a model calls for value identification, value-ranking, identification of alternatives, consequences of all alternatives, and evaluation of the consequences in terms of the identified values. The theory behind this model is that knowledge contributes to the likelihood of viable decision. Economic analysis contributes heavily to this decision-making process in the high ranking of

economic consequences. Economic information lessens the area of uncertainty. Such information can also cast light on conflicts over competing and mutually exclusive uses and on the economic motives of interest groups that play an important part in decision-making. Economic analysis can also indicate the economic consequences of letting non-market criteria dominate the decision-making process, and thus contribute to the rationality of this process by furthering the adequacy of the decision-maker's knowledge in water resources planning. PROMISES AND HAZARDS OF MAN'S ADAPTABILITY,
Rockefeller Univ., New York.
Rene Dubos.
Environmental Quality in a Growing Economy, edited by H Jarrett, Baltimore, The Johns Hopkins Press, p 23-40, 1966. 17 p.

Descriptors: *Environment, *Genetics, *Diversification, Human diseases, Pollutants, Economics, Smog, Water pollution, Population, Public health, Technology, Cities, Efficiencies.
Identifiers: *Socio-cultural processes, *Adaptability, *Human traits, Mutation, Malnutrition medicated survival, Prosperity, Biological past, Frontiers.

This article deals with man's ability to live under 'unnatural' conditions, or environmental changes. Animals adapt to these changes through genetic change, whereas man's genetic structure remains basically unchanged. Technological civilization can survive only if it takes cognizance of these fundamental biological attributes of mankind which are essentially unchangeable. The goal of technology, however, should not be to provide man with a sheltered environment in which he is protected from trauma, for certain traits in man's nature cannot develop normally or remain healthy without constant stimulation and challenge. The monotony of technological culture can eliminate human traits, at least in their phenotypic expression. To avoid this, a deliberate effort should be made to create and maintain as diversified an environment as possible, even at the expense of efficiency. This diversity should be a crucial test of true functionalism, since it is needed to bring out the unexpressed potentiality of mankind. Since water resources are an important aspect of environmental studies, and provide the basis for a diversified environment within the urbanizing society, this article can be of interest to water resource researchers. (Murphy-Rutgers)

THE ECONOMIST AND THE ENGINEER: ECONOMIC DYNAMICS OF WATER RESOURCE DEVELOPMENT,
Michigan Univ., Ann Arbor.
Kenneth Boulding.
Economics and Public Policy in Water Resource Development, edited by S C Smith, and E N Castle, Ames, Iowa, Iowa State University Press, p 82-92, 1965. 11 p.

Descriptors: *Water resource development, *Engineering, Dams, Prices, Irrigation, Public utilities, Flood control, Flood plain, Government supports, Fixed costs, Resource allocation, Technology, Taxes, Income.
Identifiers: *Urban water supply, Bureau of Reclamation, Income distribution.

At present water resources are usually developed by engineers. However, there is much that the economist can contribute. The engineer is project oriented whereas the economist is system-oriented. The engineer is concerned with the physical construction of a project whereas the economist is concerned with the value attached to it relative to everything else. The biggest difference between the two is that the engineer considers the price system as given whereas the economists think of it as a variable open to change. With regard to public versus private development of water resources the author makes an argument for more private enterprise in this area. He then discusses the relative states of development in the water resource area. In line with this, the price structure performs the functions of allocating resources, distributing income, and directing technical change and should be used to regulate all three. These are some of the aspects of water resource development which the economist should make the engineer cognizant of. (Murphy-Rutgers)

REGIONAL DEVELOPMENT AND THE WABASH BASIN,
Illinois Univ., Urbana.
R. R. Boyce.
Urbana, Illinois University of Illinois Press, 1964. 218 p.

Descriptors: *Water resources development, *River basin development, *Recreation, Regional analysis industries, Political aspects, Water management, Transportation, Population employment, Agriculture, Technology, Wages, Flood damage, Reservoirs, Growth rates, Investment, Optimization.
Identifiers: *Wabash Basin, *Regional planning, Economic development, Differential growth, Industrial development, Delaware River Basin.

This book is a collection of essays by different authors. It is an attempt to explore some of the more fundamental questions of regional development within the realities of a specific area, the Wabash Basin. The book is organized into four main parts. Part one lays the foundation for the general discussion on regional development and change by providing specific information on the Wabash basin. Part two discusses the problems and prospects of regional development and change. First, a general national framework of regional change is presented and then the problems of effecting plans and determining policy are discussed. Part three is concerned with water and economic development. Both the nature of water resources as an initiator of regional change and the political and administrative framework required for such development are discussed. The final part of the book presents a possible model for optimum regional economic development. (Murphy-Rutgers)

UNIFICATION OF ENGINEERING ECONOMY: THE NEED AND A SUGGESTED APPROACH,
Case Western Reserve Univ., Cleveland, Ohio.
Arnold Reisman.
The Engineering Economist, Vol 14, No 1, p 1-24, Fall 1968. 24 p, 7 fig, 2 tab, 19 ref.

Descriptors: *Economics, *Investment, Time, Management, Sinking fund, Price, Salvage value, Payment, Interest, Costs, Income.
Identifiers: *General models, *Engineering economy, Economic analysis, Unification, Present worth, Annuity, Deferred annuity, Capital recovery, Time interval.

It is well recognized that human learning proceeds from the familiar to the less familiar and to the unknown, and from the particular to the general. In the theory of economic analysis, however, there is, at any given stage of development, much to be gained from an ability to proceed from the general to the particular. In the field of chemistry, Mendeleyev's periodic table removed many burdens from the students of chemistry and in a very straightforward fashion pointed the way to discovery of new elements. Mendeleyev developed this chart by reflecting on the work of others and achieving a synthesis that demonstrated a pattern and gave meaning to formerly unconnected elements. The author contends that the various fields of management science in general and the field of economic analysis in particular are now ripe for this kind of generalization. The author briefly describes a general model for investment analysis in the hope that this will convince researchers of the need of a synthesis in the fields of managerial and engineering economy. Accordingly, one may infer that such general models will be of aid in the water area in synthesizing complex investment and capital budgeting problems. (Loeb-Rutgers)

THE EFFECT OF PROJECT LIFE DISPERSION ON KEY INTEREST FACTORS FOR ECONOMIC ANALYSES OF CAPITAL INVESTMENT,
North Carolina State Univ., Raleigh.
John R. Canada, and Harrison M. Wadsworth.
The Engineering Economist, Vol 11, No 4, p 15-36, Summer 1966. 22 p, 12 fig, 7 ref, 1 append.

Descriptors: *Economics, *Investment, *Capital, Variability, Risks, Interest rate, Distribution patterns, Project life.
Identifiers: *Project life dispersion, Project worth, Expected value, Capital recovery factor, Present value factor, Normal distribution, Uniform distribution, Beta distribution.

There is little question that project life is an important element in determining the prospective worth or relative desirability of an investment project. The dispersion or variability which can occur in project life is a prime candidate for consideration whenever the effect of risk is taken into account in an economic analysis of a prospective project. This condition is due to the typically high degree of sensitivity of project worth, or relative desirability, to changes in project life. The purpose of this paper is to discuss the effect of the dispersion of the life of a project on expected values of two key factors in economic analyses. This analysis enables one to observe the relative effects of different life distribution shapes, distribution variances, and interest rates. At the same time, it is hoped that the graphical analysis presented will permit a better judgment of when it is worthwhile to explicitly consider the effect of high dispersion by calculating the expected value of one or both of these key factors. This analysis might aid the water researcher attempting to decide on the desirability of an investment project. (Loeb-Rutgers)

AN ECONOMIC THEORY OF TECHNOLOGICAL CHANGE,
Yale Univ., New Haven, Conn.
W. D. Nordhaus.
American Economic Review Vol LIX, No 2, p 18-28, May 1969. 11 p, 3 tab, 12 ref.

Descriptors: *Productivity, *Technology, *Interest rate, Capital, Labor, Monopoly, Consumption, Pricing, Costs, Equilibrium, Patients.
Identifiers: *Technological change, Maximum likelihood estimator, Entrepreneurs invention, Factors of production.

The article is an attempt to establish a reasonable model of the inventive process for the purpose of sorting out the sources of productivity change among the different factors of production. Technological change has largely been neglected in economic analysis. The author derives his model and incorporates it into the conventional neoclassical model of the economic system. The chief differences in the structures are found to be that technology can be interpreted in the growth equation as a capital good with unitary exponent and that the technology-formation function derived is quite different from the capital formation equation. The conclusions of the model are tested and it is found that patents are positively correlated with in-

creases in output but negatively correlated with the level of productivity. The hypothesis of a relation between the flow of patented inventions and the growth of productivity is not supported by the testing and subsequent explanations for this result are suggested. The obvious ramifications of changes in the production function to the water resource area make this article pertinent to the water resource planner. (Murphy-Rutgers)

EVALUATION OF GOVERNMENT INVESTMENT PROJECTS,
Illinois Univ., Urbana, Ill.; and Temple Univ., Philadelphia, Pa.
John Due, and W. Lynn Holmes.
Public Finance Vol XXII, No 3, p 255-263, Spring 1967, 9p.

Descriptors: *Investment, *Government, *Economic analysis, Interest rate, Capital, Mathematical studies, Value, Indirect benefits, Profits, Risks, Economic evaluation, Economic justification.
Identifiers: *Discounting-forward, *Earnings, *Rate of return, *Cumulative adjustment, Depreciation.

This article is concerned with the question of net returns from investment projects as a basis for investment decision-making by government. An evaluation of existing projects to determine if they were economically justifiable has the advantages of focusing attention on neglected problems and suggesting new approaches. The analysis performed is directly applicable to government investment projects whose indirect benefits may be estimated in monetary terms. This would include many investment projects in the water resources area. The elements to be used in evaluation are mentioned along with the problems common to different evaluation approaches. The four major methods of evaluation are considered, that is, the ascertainment of initial year value, the forward cumulation of earnings and investment to the terminal year, the use of cumulated forward-moving year-to-year adjustment and the calculation of the internal rate of return. The success of each in an empirical study is summarized. (Murphy-Rutgers)

PRICING PIONEERING PRODUCTS,
Joel Dean Associates, Inc., Hastings-On-Hudson, N.Y.
Joel Dean.
Journal of Industrial Economics, Vol 7, No 3, p 165-179, July 1969. 15p.

Descriptors: *Pricing, Demand, Costs, Competition, Prices, Investment, Monopoly.
Identifiers: *Pioneer products, Innovation, Monopoly pricing, Price range, Sales, Rate-of-return pricing, Skimming pricing, Penetration pricing promotion.

A pioneer product is defined here as one which incorporates a major innovation. Its market is therefore, at the outset, ill-defined, since potential applications cannot be foreseen with precision. Pricing decisions usually have to be made recognizing wide margins of error in the forecasts of demand, cost, and competitors' capabilities. The difficulty of pricing new products is enhanced by the dynamic deterioration of the competitive status of most new products, where market decay is speeded by the high rate of innovation. This condition makes the life cycle of a new product's economic status a strategic consideration in practical pricing. This paper is concerned with the level of price of the new product and not its price structure (i.e. the average price per pound of a good and not the structure of price differentials depending on quality-spreads, order-size, distribution-channel, geographical location, etc.). The author concludes with nine pricing precepts for new product lines. This paper may have relevance for pricing the water service products of water systems based on changing technology (without adapting profit maximizing goals as the criterion for the pricing schedule). WELFARE METHODOLOGY AND THE MULTI-BRANCH BUDGET,
Dalhousie Univ., Halifax (Nova Scotia).
John G. Head.
Public Finance, Vol XXIII, No 4, p 405-424, 1968.

Descriptors: *Welfare economics, *Finance, *Ethics, *Political aspects, Income, Resource allocation, Employment, Taxes, Economic analysis, Budgeting, Optimization.
Identifiers: *Public finance, *Stability, Economic growth, Multi-purpose budget.

The author wishes to present a reexamination of the public finance framework. The article begins with a general discussion of the basic purposes which a welfare framework might be expected to serve. Included here is the study of a framework encompassing ethically-desirable policy proposals, a generally acceptable ordering of all economic situations, useful information for policy, and politically operational policy proposals. The author then attempts to clarify some apparent obscurities and inconsistencies in the standard formulation of the multi-branch budget. He shows that the problem of formulating and interpreting a framework of welfare objectives can be approached in any of the above manners and there is no reason that the primary emphasis should not be placed on one rather than another. Also, the main purpose to be served by the multi-branch budget of public finance theory needs to be interrupted in view of the purpose it is meant to serve. The importance of welfare economics in water resource development makes this article of interest to the water researcher. (Murphy-Rutgers)

ON THE ACCURACY OF ECONOMIC OBSERVATIONS,
Oskar Morgenstern.
Princeton, New Jersey, Princeton University Press, 1963. 322 p.

Descriptors: *National income, *Income, *Growth rates, *Economics, *Measurement, *Statistics, Statistical methods, Time, Stability, Decision making, Foreign trade, Prices, Statistical models, Mathematical models, Mathematical studies.
Identifiers: *Accuracy, *Economic observations, *Certainty, *Error, *Economic statistics, Data, Designed experiments, Information, Observers, Questionnaires.

This study is the preliminary result of a prolonged concern with the properties of economic data. The book addresses itself to both the general reader and the professional economist. The author states that the former will see that decisions made in business and in public service are based on data that are known with much less certainty than generally assumed by the public or the government. The second group will discover that even the most widely accepted figures frequently have error components of unexpected magnitude and consequently cast doubt on many currently accepted analyses of economics. The situation pertaining to the concern with the accuracy of measurement in the social sciences, as compared to the natural sciences, may not be simpler, but even if it should be, there exists no comparable tradition of exploring errors and evaluating their influence upon economic science and its application. However, when the true conditions are realized, more powerful and realistic theory can be evolved. The author contends that we must distinguish between what we think we know and what we really do and can know. The observations and general topic of this book would be of interest to the economist involved in the water area where economic data provide the basis for empirical studies. (Loeb-Rutgers)

A NOTE ON LINEAR AGGREGATION OF ECONOMIC RELATIONS,
Delhi Univ. (India).
P. N. Misra.
International Economic Review, Vol 10, No 2, p 247-249, June 1969. 3 p, 1 ref.

Descriptors: Regression analysis, *Economics, Statistical methods.
Identifiers: *Linear aggregation, Economic relations, Macro coefficients, Micro coefficients, Matrix auxiliary regressions.

In this note the author shows that the relationships between the macro and micro coefficients derived by Theil can be derived in a simple way if one adopts a slightly different approach to the aggregation problem. The author considers the case of aggregation over a set of individuals. It is supposed that the micro relations, corresponding to a given set of individuals, are the true underlying relations indicating the micro behavior of the individuals. Further, the author defines the macro variables as the unweighted aggregates of observations on the micro variables over the set of individuals. The macro relations are then derived by applying a suitable transformation to the micro relation. In the second section of this note the layout of the micro and macro relations in matrix form are given. In section three, the author derives the relationships between the macro and micro coefficients. Issues of the aggregation problem are relevant to the specification and interpretation of water demand and use functions. Aggregation should be an important concern of empirical water analysis where an attempt is made to test economic theory with water and economic variables. (Loeb-Rutgers)

SEQUENTIAL PLANNING AND CONTINUAL PLANNING REVISION,
California Univ., Berkeley.
Steven M. Goldman.
Journal of Political Economy, Vol 77, No 4, Part 2, p 653-664, August 1969. 12p, 9 fig, 6 ref.

Descriptors: *Planning, Welfare.
Identifiers: *Sequential planning, *Continual planning revision. *Current preferences, *Social preferences, Periodic revision, Planned economy, Consumption.

This paper investigates the behavior of a planned economy within the context of neoclassical growth theory. The author is concerned with the difficulties faced by an economy where the wishes of the current population may diverge from those of the society as a whole. The author distinguishes between the desires of the current population-current preferences and those of all individuals in the society, regardless of when they will live. Since the current population constitutes the only group capable of expressing its preferences and since the composition of this group is continually changing, plans once formulated may become immediately obsolete. This potential inconsistency may be resolved through a procedure of continual planning revision or may be permitted to persist through some portion of the plan. This type of planning requires that at each moment in time the then current population be free to select whatever future plan it desires and to begin the immediate implementation of this program. Sequential planning implies the ability of the planner to determine the course of the economy over the entire planning period. The author also considers an intermediate form of planning in which programs may be scrapped and new ones instituted at points in time

before the expiration of the original plan. The author is concerned with the analyses of finite economic programs (such as those in the water area) in the context of the various types of planning techniques described above. (Loeb-Rutgers)

NATIONAL WATER RESOURCES ADMINISTRATION,
Yale Univ., New Haven, Conn.
James W. Fesler.
Economics and Public Policy in Water Resource Development. Edited by S. C. Smith, and E. N. Castle. Ames, Iowa State University Press, p 368-402, 1964. 35 p, 114 ref.

Descriptors: *Federal government, *Water resources, *Planning, *Water supply, *Utilities, *Watersheds, Treatment facilities, Droughts, Water supply, Flood control, Construction, Irrigation, Navigation, Fishing, Pollution, Dams, River system, Harbors, Recreation, Reclamation, Electric power, Forests.
Identifiers: *Economic development, Organization.

This article discusses the organization of the federal government for water resources responsibilities. National water resources administration is assumed to be the only feasible solution to economic problems for which the only alternative solutions are a valley authority or a joint regional instrument of the states and the federal government. Congressional stubbornness has resulted in conflicting water resource policies and in a complicated structure of committees for water resources. A drainage basin plan has helped ease these problems by focusing on area economic difficulties. Planning, construction and operation of water resources programs and projects should be consolidated in one department and should include other resource bases of economic development such as coal, oil and gas. The planning problem branch should concentrate on relating water to other economic resources and human needs. The entire department should recognize water resources development as an integral part of economic development, thus calling for broad-natured review and decisions. (Murphy-Rutgers)

PACIFIC SOUTHWEST WATER PLAN,
Department of the Interior, Washington, D.C.
W. I. Palmer.
Published by US Dept of the Interior, Washington, Aug 1963. 250 p, 26 tab, 9 fig.
Identifiers: *Proposals, *Southwest United States, *Water conveyance, *Water utilization, Brackish water, Canals, Economic evaluations, Feasibility study, Regional planning, Water sources, Water storage.

A comprehensive report covering a water and related resources development plan for the lower Colorado River Basin and adjacent area. The report blueprints actions to develop facilities needed to meet present requirements under reduced ground-water overdrafts, plus future requirements of the region until about 1990. Phase 1 of the plan would cost $1.9 billion and would include bridge canyon and marble canyon dams and powerplants on the main stream of the Colorado River, enlargement of the California state water project aqueduct, the central Arizona project, the southern Nevada water supply project, the dixie project in southwestern Utah, the Hooker Dam project in New Mexico, expansion of Indian irrigation project facilities, water salvage and ground-water recovery projects, initial programs related to fish and wildlife, and a 50-mgd desalting plant on the seacoast. Phase 2 of the plan would include those additional units necessary to provide for essentially all of the additional water demands for the next 25 years. Construction would extend through the year 2006. Several alternative plans are outlined.

SURVEY OF OPERATING EXPERIENCES UNDER NEW STATE WATER LAWS,
George E. Ferguson, Harvey O. Banks, John C. Detweiler, and Robert M. Dixon.
Amer Water Works Assoc J, Vol 53, No 8, p 973-978, Aug 1961. 6 p, 2 ref.

Descriptors: *Administration, *Surveys, *Water law, *Water policy, Legal aspects, Legislation, Water resources, Surface waters, Groundwater, Water rights, Water pollution, Water resources development, Water conservation, Water supply, Droughts, Permits, Hydrologic aspects, Hydrologic data, Evaluation, Administrative agencies, Supervisory control (Power).
Identifiers: Flood prevention.

At least twenty-six states have enacted new water laws since 1955; over half of these states created new water agencies. Many of the new agencies are charged with administration of both surface and groundwater, and many have greater authority than the agency which they replaced. Droughts over many areas of the country prior to 1955 may have been a motivating factor in much of the new legislation. Though accounts of operating experience are rarely published, the task group learned through personal interviews that: (1) study groups to recommend needed legislation are widely used and appear to be effective; (2) water legislation is generally too detailed to permit the flexibility needed for the best results; (3) legislation which places the responsibility for the administration of all the water resources of a state in a single agency has proved most effective; (4) local participation in local planning, development, and management is needed; (5) administrators feel a need for adequate hydrologic, economic, and other scientific data; and (6) little could be learned regarding the matter of special rights to water by type of use. DEVELOPMENT, CONSERVATION AND USE OF WATER RESOURCES.

Va Code Ann secs 10-17.1 thru 10-17.9 (Supp 1968).

Descriptors: *Virginia, *Water resources development, *Administration, *Water conservation, Water resources, Water policy, Administrative agencies, Conservation, Governments, Natural resources, Planning, Resources, Regulation, Riparian rights, Beneficial use, Preferences (Water rights), Coordination, Management, Wildlife conservation, Groundwater, Water pollution control, Pollution abatement, Water pollution, Financing, Aquatic life, Recreation facilities, Legislation.

The Board of Conservation and Economic Development is assigned the responsibility for planning the development, conservation, and utilization of Virginia's water resources. After making a study of the existing water resources and the needs and methods of conservation, the Board shall formulate a coordinated policy for the use and control of the state's water resources. In creating such policy, consideration should be given to: protecting existing rights; providing an adequate and safe water supply; promoting watershed development; protecting wildlife and groundwater supplies from drainage; supporting aquatic life; insuring minimal pollution; and developing water recreation facilities. The Board shall resolve conflicts between state agencies as to water use. It may cooperate with all branches or agencies of the federal government or of any state government and may make technical advice and information on water resources available. In all conservation and water resource matters, the Board may speak for the state. The Board shall have the necessary financial powers to carry out its purpose. (Smith-Florida)

PERMANENT JOINT COMMITTEE ON WATER RESOURCES.
R I Gen Laws Ann secs 22-7.1-1, 22-7.1-3 thru 22-7.1-5 (1968).

Descriptors: *Rhode Island, *State governments, *Water resources development, *Investigations, Water policy, Water resources, Resource development, Conservation, Governments, Water conservation, Water control, Water supply, Water works, Water purification, Water districts, Administrative agencies, Administration, Water requirements, Resources, Distribution, Water rates, Water costs, Desalination, Pipelines, Pipes, Reservoirs, Recreation facilities, Domestic water, Industrial water, Legislation.

A Permanent Joint Committee of the General Assembly on Water Resources is created. Said joint Committee consults and counsels with the state Water Resources Coordinating Board, Water departments and water districts of other governmental bodies and agencies, and with agencies and quasi-municipal corporations dealing with development and operation of water supplies, water control structures, water works, purification plants, desalination methods and plants, water pipe lines, and distribution systems. Said Committee conducts a continuing study and review of water requirements, resources, supplies, methods of acquisition and distribution, and needs and resources of communities. The Committee investigates and desirability of merging water departments and companies, the feasibility of utilizing reservoirs for recreational purposes, and the reasonableness of water rates and charges. The Committee also periodically reports to the general assembly, making recommendations to assure adequate supplies of water for domestic, industrial, agricultural, and recreational use. Said Committee may contract for necessary technical advice. (Smith-Florida)

6C. Cost Allocation, Cost Sharing, Pricing/Repayment

ECONOMICS OF PUBLIC WATER PRICING: THE CALIFORNIA CASE,
California Univ., Berkeley.
Michael F. Brewer.
Economics and Public Policy in Water Resource Development, edited by S C Smith, and E N Castle, Ames, Iowa State University Press, p 222-247, 1964. 26 p, 51 ref.

Descriptors: *Water rights, *Pricing, *Economic efficiency, Water rates, Public utilities, Economic evaluation, Dams, Reservoirs, Irrigation, Water resource development, Water supply, Economic analysis, Water districts, Investment, Elasticity of demand.

Identifiers: *California Aqueduct, *Parameters, *Beneficiary payments, Benefit pricing, Marginal monetary utility, Perpetuity contracts.

This article deals with the development of relevant criteria and their application in the evaluation of specific pricing alternatives in public agencies' pricing practices, using water development as a model. Proposals of the state of California to construct, finance, and administer a statewide water development plan are used for illustrative purposes. The economic rationale of this water plan is inferred as the increase of net productivity of the state. Hence, although water development is given special individual attention, public resource developments are frequently integrated with general economic planning. This results in making the purposeful use of water a potentially prominent issue for research and practical implementation, since it is designed to induce particular patterns of population and economic activity. In anticipation of this potentiality, proposals for state pricing policy must be accommodating to future changes which will permit the integration of the California Water Plan into broader economic planning. Perpetuity contracts seem inappropriate to these goals, whereas service by the state would render receipts available for public reinvestment and additional outlays for the plan. (Murphy-Rutgers)

STATE AND LOCAL GOVERNMENTS AND THEIR BUDGET CONSTRAINT,
Board of Governors of the Federal Reserve System, Washington, D.C.
Edward M. Gramlich.
International Economic Review, Vol 10, No 2, p 163-182, June 1969. 20 p, 3 tab, 15 ref.

Descriptors: *Budgeting, *State governments, *Local governments, Credit, Expenditures, Income, Statistical methods, Model studies, Taxes, Gross National Product, Interest rate, Capital, Debt, Regression analysis.
Identifiers: *Budget constraint, *Budgets, Econometrics, External forces, Grants-in-aid, National accounts budget.

Econometric models have probed many previously unexplored areas of the United States economy. However, there is one sector still relatively untouched by model-builders, and strangely enough, it is a sector which today is generating some of the most heated political controversy, that is, the area of state and local governments. Although there have been many analyses of certain aspects of state and local behavior (both institutional and econometric) on both a micro and a macroeconomic level, none of these analysis have adequately considered the budget constraint under which states and localities operate. These governmental units are generally required to balance their current operating budgets, and they must pay a default risk premium when they make use of credit markets. State and local expenditure and revenue items cannot be analyzed in isolation. The research approach must permit expenditure and revenue policies to be formulated simultaneously and allow them to have mutual ramifications. This study attempts to build such a budget constraint into behavioral descriptions of the components of state and local budgets. The budget constraint proves to have an important effect on the method by which state and local budgets respond to external forces such as movements in GNP, interest rates, and federal grants-in-aid. The paper then presents a statistical estimate of the budget constraint model. Since these governmental bodies are involved in water investment and development projects, this analysis of the role of budget constraints provides the water researchers with insights into effects of macro variables on the water area. THE LOGIC AND MATHEMATICS OF NON-ANNUAL COMPOUNDING APPLIED TO INVESTMENT DECISIONS,
Michigan Univ., Ann Arbor.
Harry Benford.
The Engineering Economist, Vol 12, No 2, p 67-92, Winter 1967. 26p, 7 fig, 1 tab.

Descriptors: *Mathematical studies, Investment, Interest, Interest rate, Return, Debt.
Identifiers: *Non-annual compounding, *Investment decision, Compound interest.

The author suggests that many of us have grown so used to living with compound interest that we have forgotten its underlying principles. In particular, those who deal in long term investment decisions often grow too accustomed to the simplifying assumption of annual compounding. When confronted with situations in which non-annual compounding must be understood, we often find ourselves confused. The purpose of this paper is to stimulate clear thinking about non-annual compounding and to suggest when and where it may apply. An economic analyst, the author contends, should be able to deal in both nominal and effective interest rates. He should understand how to handle both discrete and continuous returns, and how to find their equivalent interest rates based on annual compounding. This paper should prove valuable to the water researcher involved in the investment decision making process with the associated problems of rate of return, present value of benefits and capital budgeting. Economics and Public Policy in Water Resource Development. Edited by S. C. Smith, and E. N. Castle. Ames, Iowa, State University Press, p 209-221, 1965. 13 p, 10 ref.

Descriptors: *River basin development, *Costs, Direct benefits, Indirect benefits, Capital, Cost-sharing, Cost-benefit analysis, Cost repayment, Economic justification, Project benefits, Project costs, Cost allocation, Rivers, Government.
Identifiers: *Financial responsibility, International rivers.

Sharing financial responsibility of river-basin development involves division of project and program costs among purposes, interests, groups and individuals. These have to be divided between primary and secondary beneficiaries, state or local governments and the national public. This article centers primarily on the approaches, guides and problems involved in the division of project costs among interests and participants. Thus, the objectives to be served and the merits and limitations of alternative basic approaches for apportioning charges or assessments are studied as well as the adjustments and modifications necessitated by problems of practical application and acceptability. The author recommends that requirements be established to serve more specific objectives than is presently the case to achieve optimum resource development and use and to promote desired incidence, distribution and stabilization policies. In establishing requirements for most project purposes, greater emphasis should be placed on charges and assessments based on value of services and less on the computed cost of providing services. COMMONALITY, THE PRICE SYSTEM, AND USE OF WATER SUPPLIES,
Florida State Univ; Tallahassee.
Jerome W. Milliman.
The Southern Economic Journal Vol XXII, No 4, p 426-437, April 1956, 12p.

Descriptors: *Economics, *Pricing, *Water resource allocation, *Costs, Water supply, Taxes, Government, Return to scale, Water reuse, Marginal cost, Optimization, Proration, Legal aspects, Water demand.
Identifiers: *Commonality, *Spill-over costs, Quotas, Social costs, Costs of production.

This paper seeks to show that greater reliance should be placed upon the price system to allocate water resources efficiently among the competing uses and users. Water as a resource or factor of production has no unique qualities which should cause it to be treated differently from any other economic resource. The major deterrent to the increased use of the price system to allocate water resources is the fact that water resources are utilized in common, giving rise to the problem of spill-over costs discussed in the article. The two major lines of analysis are: (1) The adjudication of specific water rights through the setting of titles; or (2) The imposition of extraction of use taxes designed to correct the divergence between private and social costs. Each method is discussed and it is stressed that the commonality problem must be dealt with so that the price system can aid in the optimum allocation of water resources. (Murphy-Rutgers)

COMMENTS ON 'RECREATION BENEFITS FROM WATER POLLUTION CONTROL',
Montana State Univ., Bozeman.
Oscar R. Burt.
Water Resources Research, Vol 5, No 4, p 905-907, August 1969. 3p, 1 fig, 6 ref.

Descriptors: *Water pollution control, *Water pollution, *Benefits, Demand, Sport fishing, Recreation demand, Social values, Recreation, Costs, Recreation facilities, Prices, Cost-benefit analysis.
Identifiers: *Recreation benefits, *Consumer surplus, Willingness to pay, Marginal social value, Marginal social cost, Gross benefits, Gross social value.

The author comments on an article and note by Joe B. Stevens pertaining to two alternative measures of benefits associated with water pollution control in a sport fishery. The purpose of this note is to present a third measure and to show that the other two measures are of doubtful logical validity. The two measures of benefits attributable to pollution prevention by Stevens he calls (1) increased consumer surplus and (2) increased willingness to pay. The definition of consumer surplus was taken from Marshal and willingness to pay from Marglin. Stevens' analysis is applied to a graph showing two demand curves: D sub o corresponding to low pollution and D sub 1 corresponding to high pollution. In Stevens' note he is only concerned with a procedure for measuring the gross benefits of pollution control. Stevens apparently felt it necessary to infer social value from only D sub 0 and used D sub 1 only to determine quantity taken at a zero price under polluted conditions. The author feels that the discrepancy in benefits associated with pollution control that Stevens found when using the two criteria is a result of his dubious method of applying the two criteria. The author then presents a generalized framework for analysis which permits evaluation of pollution control under the assumption of optimum pricing. Here, the difference in net values associated with polluted and unpolluted water measures the social reward from pollution control when recreation facilities are optimally priced. This net social value could then be compared with the initial investment cost of pollution control in some sort of benefit-cost framework. (Loeb-Rutgers)

THE INTERNAL RATE OF RETURN AS A RANKING CRITERION,
Michigan Univ., Ann Arbor; AND Stanford Univ., Calif.
James C. T. Mao.
The Engineering Economist, Vol 11, No 4, p 1-13, Summer 1966. 13p, 2 fig, 8 ref.

Descriptors: *Investment, Decision making.
Identifiers: *Internal rate of return, *Ranking criterion, Net present value, Reinvestment rate, Marginal investment return, Fisherian intersection.

In two recent articles, Teichroew, Robischeck, and Montalbano investigated the net present value (NPV) and the internal rate of return (IRR) criteria for accepting or rejecting investment alternatives available to a firm. The accept-reject decisions are the only investment decisions with which a firm need be concerned provided its capital is not rational and its investments are not mutually exclusive. Realistically, however, firms must frequently choose among mutually exclusive investments and more often than not have only limited access to the capital market. When these conditions prevail, optimal decision procedure requires that each investment be appraised both on its own merit and in relation to the merits of any other competing investments. For such appraisals, the management needs not only a rule for classifying investments into acceptable and unacceptable projects but also a criterion for ranking investments in the order of their profitability. The purpose of this paper is to compare the NPV and the IRR as a criterion for ranking competing investments. This article may provide the water researcher with an analysis to decide between investment alternatives embodying different technologies or different project objectives. (Loeb-Rutgers)

SOME MANAGERIAL INFLUENCES ON A FIRM'S PRICING POLICY,
Lancaster Univ., Bailrigg (England).
A. J. Burkart.
Journal of Industrial Economics, Vol 17, No 3, p 180-187, July 1969. 8p.

Descriptors: *Pricing, Demand, Costs, Budgeting.
Identifiers: *Managerial influence, *Pricing policy, Administrative deterrents, New products, Irrationalities.

The author discusses certain factors influencing a firm's pricing policy, which arise more from the way a firm is run than from the way it reacts to changes in the market. The author argues that managerial influences tend to militate against a flexible pricing policy, or a policy that recognizes and seeks opportunities to vary, upwards or downwards, the prices of the firm's products. A firm will determine a price which seems to it appropriate and an estimate of market demand will only be one consideration in this process. The author argues that a firm's prices will be set at a level arrived at in practical terms by successive adjustments from previous historical levels and possibly without much explicit consideration of market demand. Generally, rising costs are a more potent factor in the raising of prices than is buoyant demand. The author then discusses certain managerial influences tending to incline a firm to keep intact its current prices and price structure. This paper, therefore, may provide alternative treatments to the pricing decisions of water supply systems instead of relating water pricing policies to conventional microeconomic demand analysis. UNEMPLOYMENT AND COST-BENEFIT ANALYSIS,
Pennsylvania Univ., Philadelphia; Princeton Univ., N.J.; and Rochester Univ., N.Y.
Nevins D. Baxter, E. P. Howrey, and R. G. Penner.
Public Finance, Vol 24, No 1, p 80-88, 1969.

Descriptors: *Unemployment, *Cost-benefit analysis, Employment, Benefits, Costs, Interest rate, Prices.
Identifiers: *Local employment, Target employment rate, Geographical distribution, Regional employment, Public projects.

The standard works on cost-benefit analysis are somewhat ambivalent on whether the presence of unemployment warrants an adjustment to the usual calculation of benefits and costs. Eckstein points out that the government will usually have a long list of projects which can be justified on the basis of cost-benefit calculations made under the assumption of full employment. He argues that they should simply proceed somewhat further down the list in times of unemployment. However, if there are not a sufficient number of projects which qualify under the full employment assumption, he suggests that the benefit-cost ratios be adjusted upward by using a lower interest rate and by adjusting raw material and factor prices downward. McKean agrees that unemployment warrants some adjustment of benefit-cost estimates, but suggests that practical problems preclude incorporating the effects of unemployment in the calculation. Prest and Turvey adopt McKean's position but argue that some adjustment might be warranted if unemployment exists in the locality of the project. This note argues that there are conceptual as well as practical reasons for not adjusting benefit-cost estimates to reflect national unemployment levels. The calculation of local employment effects is also considered with particular reference to whether these effects should be counted as part of the total benefits. This should prove applicable to the water area since cost-benefit analysis is employed in the decision making process for many water investment projects. (Loeb-Rutgers)

THE LARGE PLANT CONCEPT,
Kellogg M. W. Co., New York.
L. Axelrod, R. E. Daze, and H. P. Wickham.
Chem Engr Progr 64 (7), 17-25, 1968. 9 p, 10 fig.
Identifiers: *Chemical production, *Economic evaluations, *Operating experience, Multipurpose plant, Operational problems, Plant factor, Startups.

Factors affecting the economics and operating problems encountered in installing large plants are reviewed. Comparisons are presented for the investment and manufacturing costs of medium and large size fluid catalytic cracking units, ethylene plants and ammonia plants. In the case of the cracking units and ethylene plants, operating cost savings in the larger plants are almost entirely due to the effect of scale on investment. However, for ammonia plants, larger plants permit the use of centrifugal compressors with turbine drives which permit significant heat recovery within the process. The maximum size of large plants doubles every five years. The startup times and stream factors experienced for 17 large ammonia plants are given. Two-thirds of the plants were making product within 45 days and were at full capacity after 65 days. Problems that have reduced stream factors in cracking plants are reviewed along with the effect of average stream factor over a four-year period of operation on the interest rate of return.

BRIDGE REVENUE BOND ACT.

Miss Code Ann secs 8448-8469.5 (1956), secs 8469.5-01 thru 8469.5-09 (Supp 1968).

Descriptors: *Mississippi, *Bridges, *Bridge construction, *Financing, Civil engineering, Capital, Financial feasibility, Government finance, Local governments, State governments, Costs, Construction costs, Condemnation, Legislation, Legal aspects, Construction, Mississippi River.

Any county or city is authorized to acquire by purchase or condemnation and to construct, improve, or operate Mississippi River bridges which are wholly or partly within such county or city or are within twenty miles thereof. Revenue bonds may be issued to finance the cost of such bridges, provided the bond issue is approved by a majority of the electorate. No bridge for the use of the traveling public or ferry may be constructed or operated within fifteen miles of a toll birdge financed by revenue bonds under this act unless permission is given by the state highway commission. A bridge commission may be formed by the governing authorities of a city or county which has acquired or constructed a bridge authorized by this act and has issued revenue bonds to finance the acquisition or construction. The commission shall serve at the pleasure of the governing authority of the political subdivision and shall be empowered to supervise and maintain the bridge as a separate proprietary venture. Descriptors: *Water utilization, *Consumptive use, Industrial water, Municipal water, Domestic water, Irrigation water, Water supply, Data collections, Hydrologic data, Reviews, Surveys.
Identifiers: US Water use (1965).

Data on water consumption in 1965 in the US were compiled by the USGS from readily available sources and a summary article was prepared from that report. Estimates are given of the quantity of water used in the states and water-use regions of the US for public, rural, irrigation, self-supplied industrial, and hydroelectric uses. Consumptive use is also estimated. In 1965, about 310,000 mgd were withdrawn for all uses except hydroelectric power. Of this water, about 78,000 mgd were consumed. About 2,300,000 mgd were withdrawn for hydroelectric power. Industrial withdrawal was about 170,000 mgd, about 125,000 mgd of which was fresh and 45,000 mgd saline. Irrigation withdrawals were about 120,000 mgd, public supplies used 24,000 mgd and rural uses, 4,000 mgd. Groundwater supplied about 20% of all withdrawals. Of 78,000 mgd consumed, irrigation used 66,000 mgd, public supplies 5,200 mgd, and rural, 3,200 mgd. (Knapp-USGS)

THE IMPACT OF THE COMMERCE CLAUSE ON THE RIPARIAN RIGHTS DOCTRINE,
Fletcher N. Baldwin, Jr.
U Fla L Rev, vol 16, no 3, p 370-423, Winter 1963, 54 p, 242 ref.

Descriptors: *Water resources development, *Governments, *Federal-state water rights conflicts, *Relative rights, Federal government, Multiple-purpose projects, Natural resources, Planning, Political aspects, Legal aspects, State governments, Water conservation, Water resources, Water supply, Water rights, Riparian rights, Jurisdiction, Navigable rivers, Navigable waters, Navigation, Non-navigable waters, Compensation, Federal jurisdiction, Water policy, Obstruction to flow, Prescriptive rights, Water pollution.
Identifiers: *Commerce clause.

The federal resources development program has been made possible largely by the United States Supreme Court's development and interpretation of the commerce clause. The federal government now has complete control over navigable waters and qualified control over non-navigable waters. Federal power or dominant servitude has extinguished riparian rights of individuals and of the states if either limited federal control. Certain riparian interests may be taken without compensation on both navigable and non-navigable waterbodies. Riparian owners do not want to give up state-granted water rights, and state action and cooperation is preferred, but in the absence of state initiative the federal government must act to preserve the nation's critical water supply. The national government can take away riparian rights, and the commerce clause is useful in justifying federal encroachment, but in settling conflicts the Supreme Court continues to be the ultimate water law agency. The riparian rights doctrine must be altered for efficient use of the water supply. It is time for serious federal-state cooperation in working out solutions to water problems facing the nation at both levels of government. (Douberley-Florida)

THE IMPACT OF THE COMMERCE CLAUSE ON THE RIPARIAN RIGHTS DOCTRINE,
Fletcher N. Baldwin, Jr.
U Fla L Rev, Vol 16, No 3, p 370-388, Winter 1963.

Descriptors: *Navigable waters, *Non-navigable waters, *Federal-state water rights conflicts, *Tributaries, Water resources development, Navigation, Navigable rivers, Judicial decisions, Streams, Riparian waters, Riparian rights, Relative rights, Rivers, Multiple-purpose projects, Flood control, Federal government, Federal jurisdiction, Regulation, Legal aspects.
Identifiers: *Commerce clause, Constitutional law.

The development and interpretation of the commerce clause by the Supreme Court has laid a foundation that allows the federal government to provide for the optimal utilization of the water resources available. Justice Marshall declared that the regulation of commerce was the regulation of commercial navigation, and federal authority was quickly extended to all navigable waters, exclusive of state interference. This authority was broadened to non-navigable tributaries, if water commerce was affected, and to streams with even a potential availability for navigation. Where riparian rights in any way limited federal control, they were extinguished. If shown that a stream could be made navigable by reasonable improvements, that Congress intended some benefit to commerce, or that projects along a non-navigable tributary somehow aided navigation, Congressional exercises of power would be upheld. Flood control and waterway development were added to the maintenance of navigation as legitimate constitutional objectives. (Douberley-Florida)

THE IMPACT OF THE COMMERCE CLAUSE ON THE RIPARIAN RIGHTS DOCTRINE,
Fletcher N. Baldwin, Jr.
U Fla L Rev, Vol 16, No 3, p 388-403, Winter 1963.

Descriptors: *Navigable waters, *Non-navigable waters, *Compensation, *Damages, Navigable rivers, Federal-state water rights conflicts, Riparian rights, Diversion, Riparian land, Tributaries, Ownership of beds, River beds, Access routes, Banks, High water mark, Bank erosion, Flood damage, Project purposes, Federal government, Legal aspects, Obstruction to flow, Alteration of flow, Regulation, Control.
Identifiers: Dominant servitude, Harbor lines.

The power to regulate and improve navigable waters has created a dominant servitude in favor of the federal government. The government is not held responsible for any damage caused to private riparian property as a direct result of the regulation and improvement of navigable waters. On the other hand, compensation may be awarded to riparians on a non-navigable tributary of the improved navigable waterbody. The navigable servitude doctrine is also extended to non-navigable streams as long as improvements are necessary for the improvement of navigation in the connecting watercourse. The power to establish harbor lines limits the construction of state and private structures to within established areas, but there is no compensation for financial hardship as long as the government does not actually injure or physically take property. The riparian's right to access may also be destroyed without compensation. There is no compensation for injury to riparian embankments caused by alteration of flow by dams, and flood damage may be declared an act of nature. The Court, as the ultimate water law agency, may well eliminate the distinctions between navigable and non-navigable streams. (Douberley-Florida)
W70-01595

THE IMPACT OF THE COMMERCE CLAUSE ON THE RIPARIAN RIGHTS DOCTRINE,
Fletcher N. Baldwin, Jr.
U Fla L Rev, Vol 16, No 3, p 403-423, Winter 1963.

Descriptors: *Water resources development, *Federal-state water rights conflicts, *Project planning, *Water utilization, Political aspects, Relative rights, Riparian rights, Navigable waters, Non-navigable waters, State governments, Federal government, Water management (Applied), Water conservation, Planning, Social function, Water rights, Cooperatives, Judicial decisions.

Identifiers: *Federal-state cooperation.

The expanding interpretation of the commerce clause must conform to the needs of national water problems, whether it was intended to be extended to non-navigable streams or not. States may have the best access and control of water, but the federal government also has a concern in remedying the critical water resources problem. Lack of aggressive state action continues to force the federal government to plan for and counter these problems, and so long as federal activity presents some aspect of proper federal control the courts will not restrict it. Water rights of the states as well as of the individual are limited by federal supremacy, but state activity has been allowed where Congress has elected not to intrude. States are also given a voice in federal-state cooperative projects, but this cooperation has been severely inadequate. Where federal-state conflicts cannot be resolved, the Supreme Court will support the federal government, but the court should not be the ultimate water law agency. Serious cooperation is needed in working out a more efficient system of water use and management and especially in altering the riparian rights doctrine. (Douberley-Florida)

WATER AND WATER COURSES - LAND-LOCKED NON-NAVIGABLE LAKES - OWNERS RESTRICTED TO REASONABLE USE.

Rutgers L Rev, vol 14, no 4, p 837-840, Summer 1960, 4 p, 27 ref.

Descriptors: *Florida, *Non-navigable waters, *Relative rights, *Reasonable use, Civil law, Water policy, Right-of-way, Access routes, Lakes, Competing uses, Domestic water, Natural use, Obstruction to flow, Recreation, Riparian rights, Boundaries (Property), Lake beds, Lake shores, Ownership of beds, Judicial decisions.
Identifiers: Common law.

Defendants were owners of riparian land adjacent to plaintiff's riparian lands. Said properties extended to and underlay a corner of a land-locked, non-navigable lake. Defendants erected water barriers along the boundaries of their submerged lands, thereby eliminating plaintiff's use of that portion of the lake overlying defendant's fee. The Florida court ordered that the enclosures be removed. In so ruling, the court adopted the civil law rule, which holds that each riparian owner has a right of access to the entire lake instead of the common law rule, which states that each riparian owner has absolute control of the water which overlies his fee. This preference for the civil law rule was based on grounds of public policy in a water-oriented resort state. However, the court failed to discuss the inequity of allowing each owner full use of the lake despite possible discrepancies in the comparative size of the various holdings. While the theory of reasonable use, as part of the civil law rule, is appropriate for running waters, it is suggested that a better test would involve the reasonable man in a similar position; this would take into account defendant's motives. (Smith-Florida)

STUDY AND REPORT IN SUPPORT OF LEGISLATION CONCERNING HARMFUL ALTERATIONS IN, USES OF, AND ACTIVITIES IN CONNECTION WITH WATERCOURSES AND LAKES.
Cornell Univ., Ithaca, N.Y. Water Resources and Marine Sciences Center.

Study and Report in Support of Legislation Concerning Harmful Alterations in, Uses of, and Activities in Connection with Watercourses and Lakes, (A Revision of Preliminary Report of Feb 1, 1967), Feb 28, 1967. 66 p, 133 ref.

Descriptors: *New York, *Alteration of flow, *Reasonable use, *Preferences (Water rights), Legislation, Planning, Water resources development, Riparian land, Riparian water, Riparian rights, Water rights, Natural flow doctrine, Competing uses, Domestic water, Natural use, Obstructions to flow, Relative rights, Bodies of water, Water users, Water utilization, Water allocation (Policy), Water policy, Water pollution, Legal aspects.
Identifiers: Trespass, Negligence.

A number of additions to the New York conservation law are proposed by the Cornell Water Resources Center. It is proposed that a riparian owner should have no cause of action for damages against a co-riparian who alters the natural flow, quality, quantity, or condition of a body of water to further the use and enjoyment of riparian property, so long as the alteration is reasonable. The same privilege to make alterations should be extended to include an alternative of furthering the use of non-riparian land. The factors that should be considered in determining the reasonableness of harm are outlined. The proposals are not to affect actions for negligence or trespass and do not affect pollution laws or injunctions by governmental bodies. Each proposed section is accompanied by comments on the desirability of the legislation, its need in the state, and its constitutionality in the face of anticipated attacks. (Douberley-Florida)
W70-01301

STUDY AND REPORT IN SUPPORT OF LEGISLATION CONCERNING HARMFUL ALTERATIONS IN, USES OF, AND ACTIVITIES IN CONNECTION WITH WATERCOURSES AND LAKES.
Cornell Univ., Ithaca, N.Y. Water Resources and Marine Sciences Center.

Study and Report in Support of Legislation Concerning Harmful Alterations in, Uses of, and Activities in Connection with Watercourses and Lakes, p 5-6, p 13-17, (A Revision of Preliminary Report of Feb 1, 1967), Feb 28, 1967.

Descriptors: *Alteration of flow, *Reasonable use, *Riparian rights, *Preferences (Water rights), Lakes, Streams, Water resources development, Natural flow doctrine, Relative rights, Streamflow, Water quality, Riparian land, Riparian waters, Water rights, Competing uses, Prior appropriation, Priorities, Artificial use, Obstructions to flow, Bodies of water, Water utilization, Legal aspects.

The Cornell Water Resources Center proposes a number of additions to the New York conservation law for the purpose of reducing uncertainties in the state common law concerning rights of riparians on streams and lakes. Such additions would enable private parties to undertake water-connected projects while being sure of their rights, and draftsmen of water resources development statutes may better determine legal obstacles with reasonable certainty. Section 429-k of the proposal provides that an alteration in the natural flow, quantity, quality, or condition of a body of water by a riparian owner to further the use and enjoyment of riparian property may not give rise to a cause of action if the alteration is reasonable, even though it is causing real or substantial harm to others. The establishment of reasonableness in a particular circumstance is preferable to definite rules that cannot cover the infinite number of conceivable situations. The rule that makes an alteration harmful if it harms a co-riparian gives a permanent advantage to the riparian who first exercises his riparian rights, in violation of established principles of the riparian doctrine, and imposes a rigidity that makes it difficult to meet new water needs. (Douberley-Florida)
W70-01302

STUDY AND REPORT IN SUPPORT OF LEGISLATION CONCERNING HARMFUL ALTERATIONS IN, USES OF, AND ACTIVITIES IN CONNECTION WITH WATERCOURSES AND LAKES.
Cornell Univ., Ithaca, N.Y. Water Resources and Marine Sciences Center.

Study and Report in Support of Legislation Concerning Harmful Alterations in, Uses of, and Activities in Connection with Watercourses and Lakes, p 17-32, (A Revision of Preliminary Report of Feb 1, 1967), Feb 28, 1967.

Descriptors: *Water rights, *Public benefits, *Riparian rights, *Preferences (Water rights), Water pollution, Cities, Compensation, Benefits, Comparative benefits, Relative rights, Projects, Project planning, Regulation, Legal aspects.
Identifiers: Harmful use, Water rights impairment, Constitutional law.

Proposed section 429-k does not affect enforcement of pollution statutes, and it is needed to counter uncertainty created by dicta that might allow an opposite interpretation of existing law. Constitutional challenges that the rights of those harmed are deprived without just compensation are not plausible because the proposal is a valid exercise of the police power in furtherance of the public interest, and the impairment of rights is so small as not to constitute a taking. The public interest greatly outweighs the incidental harm to rights of riparians. The state is not depriving riparians of rights but is merely readjusting rights among co-riparians. Although recent decisions may present some problems with overly broad language condemning similar provisions, no court has struck down a statute that destroys a cause of action only for injury suffered as the result of a reasonable activity. Identifiers: Malicious acts.

Section 429-m lists the factors that should be considered in determining the reasonableness of harmful alterations in watercourses and lakes. These considerations should include: (1) suitability to the region, in view of custom; (2) relative importance to the public; (3) amount of harm caused, although a finding of greater harm than an alternative is not determinative; (4) ease of minimizing or avoiding harm; (5) location of the contestants' points of access; (6) priority in time of the commencement of activities, although priority does not necessarily establish reasonableness; and (7) motive of the person effecting alterations, although only a primarily malicious motive is determinative. No alteration should be classified as unreasonable as a matter of

law because of its nature or consequences. This section codifies the principle of variability in response to changing conditions, which is valuable in meeting changing water needs. The public interest in developing water resources outweighs the right of riparians to be free from reasonable harm. The provision should be made retroactive. Constitutional challenges may be met as a permissible exercise of the police power, since only small expenditures by the challenger would probably be involved. (Douberley-Florida)

STUDY AND REPORT IN SUPPORT OF LEGISLATION CONCERNING HARMFUL ALTERATIONS IN, USES OF, AND ACTIVITIES IN CONNECTION WITH WATERCOURSES AND LAKES.
Cornell Univ., Ithaca, N.Y. Water Resources and Marine Sciences Center.

Study and Report in Support of Legislation Concerning Harmful Alterations in, Uses of, and Activities in Connection with Watercourses and Lakes, p 11-12, p 58-66, (A Revision of Preliminary Report of Feb 1, 1967), Feb 28, 1967.

Descriptors: *Alteration of flow, *Riparian rights, *Municipal water, *Water utilization, Natural flow doctrine, Riparian land, Riparian water, Reasonable use, Public benefits, Domestic water, Cities, Compensation, Artificial use, Flooding (Intentional inundation), Flood damage, Bodies of water, Beds under water, Legal aspects, Surface waters.
Identifiers: Negligence, Trespass.

According to section 429-n, nothing in the proposed provisions will affect common law actions against a person who effects an alteration in a negligent manner. The determinative factors for negligence are similar to those used in determining reasonableness, including whether the risk of harm is unreasonable in view of the social value, whether less dangerous methods could be used, or whether the conduct is customary. The riparian's right to freedom from personal intrusion and the common law rule that domestic uses are reasonable as a matter of law remain intact. Municipal rights are not altered, and it is doubtful that existing law allows a municipality to take water without compensating riparians. Section 429-o does not increase the instances where a person may enter riparian land, above or below the surface or may cause harm by flooding another's dry land. The common law domestic use doctrine is not altered. (Douberley-Florida)

LICENSE TAXES AND REQUIREMENTS TO TAKE SHELLFISH.
Va Code Ann secs 28.1-119 thru 28.1-123 (1969).

Descriptors: *Virginia, *Permits, *Taxes, *Commercial shellfish, Tax rate, Oysters, Clams, Shellfish, Commercial fishing, Administrative agencies, Fisheries, Conservation, Fish conservations, Legislation.
Identifiers: Residency requirements.

The state graduated license tax on persons, firms, and corporations engaged in the business of shucking or packing oysters is based on the volume of business during the license period. The tax is computed on written volume reports filed by the licensee in January of each year. False reporting constitutes a misdemeanor. This license tax is in lieu of all state taxes on the capital of the business. Persons wishing to take or catch oysters or clams by hand or tongs from areas not leased for oyster planting purposes must be licensed and have the license available for inspection. Licensing requirements do not attach to persons taking clams or oysters for immediate household use. Non-residents are those persons not paying state taxes, not residing in the state over a year, or landowners not residing in the state over four months. Non-residents taking or planting oysters for market or profit are guilty of a misdemeanor. It is a misdemeanor for citizens of this state to be interested with any non-resident in the commercial taking of fish or shellfish or oyster planting in state waters. (McDonough-Florida)

CRABS.

Va Code Ann secs 28.1-165 thru 28.1-174 (1969).

Descriptors: *Virginia, *Commercial fishing, *Commercial shellfish, *Crabs, Taxes, Permits, Inspection, Control, Regulation, Administrative agencies, Dredging, Legislation, Legal aspects, State jurisdiction, Fish conservation, Supervisory control (Power), Fisheries.

Persons desiring to take crabs for market or profit from the waters of the state and persons engaging in the business of buying or marketing crabs must pay an annual license tax. The amount of the tax varies according to the method and scale of the crab fishing. Use of scrapes and dredges for catching crabs is prohibited during a specified season. The Commission of Fisheries may modify the prohibition in certain circumstances. Crabs must surpass certain size limitations before they may be retained when caught. The inspector for each district may examine any catches to determine whether the crabs therein meet statutory size requirements. The number of crabs that can be taken by one boat in one day may be limited at the Commissioner's discretion. Sponge crabs may not be taken from May to September within a certain geographical area. Crabs generally may not be taken commercially on Sunday or at night. Crab traps or pounds must be placed at least one hundred yards apart and must be completely removed from the water at the end of each season. Anyone may take up to one bushel of crabs per day for household use without obtaining a license. (Kelly-Florida)
W70-01314

HEALTH PROVISIONS: FISH AND SHELLFISH.
Va Code Ann secs 28.1-175 thru 28.1-183.1 (1969).

Descriptors: *Virginia, *Commercial fishing, *Commercial shellfish, *Public health, Fish conservation, Water pollution, Fish management, Environmental sanitation, Environmental effects, Regulation, Administrative agencies, Control, Inspection, Permits, Shellfish, Legislation, Legal aspects, Supervisory control (Power).

The State Health Commissioner is authorized to examine fish and shellfish in planting grounds and in packing houses within the state or in other places from which the fish and shellfish are to be taken or sold for food purposes. He may survey the sanitary conditions and pollution hazards adjacent to and within shellfish growing areas and within packing houses and plants for the purposes of protecting the industries and the public health and preventing the sale of fish and shellfish deemed unfit for market. The Health Commissioner shall notify the Commissioner of Fisheries of any findings of unfit fish or shellfish and of unsanitary or polluted conditions. He shall also notify any affected owner of fishing grounds or plant operator and may enjoin further operation and/or fishing until corrections are made. Polluted fish or shellfish grounds may be condemned seasonally or indefinitely by the State Health Commissioner. Areas may be closed in emergencies without recourse to hearings. Some replanting may be permitted of shellfish from condemned areas under close Commission supervision. All oysters and clams imported from other states must have been certified fit for market. The Fisheries or Health Commissioners may seize goods caught and/or sold contrary to this statute. (Kelly-Florida)
W70-01315

ENFORCEMENT OF FISH AND SHELLFISH REGULATIONS.
Va Cpde Amm secs 28.1-184 thru 28.1-194 (1969).

Descriptors: *Virginia, *Commercial fishing, *Regulation, *Commercial shellfish, Maryland, Bays, Tidal waters, Fish conservation, Fish management, Shellfish, Legislation, Legal aspects, Inspection, Investigations, Permits, Control, Administrative agencies, Supervisory control (Power), Political aspects, Water policy.
Identifiers: Chesapeake Bay, Interstate cooperation.

The Commission and Commissioner of Fisheries, all inspectors, police captains of boats, and other authorized agents may arrest any violator of the state's fish or shellfish laws with or without a warrant. They may, further, seize any vessel and/or cargo pursuant to enforcement of these laws. Violations of the fish or shellfish laws constitute misdemeanors. Maryland authorities attempting to make arrests or seizures for violation of Maryland fish and shellfish laws may cross the Virginia-Maryland boundary in the Chesapeake Bay to make such arrests. No person may use any drag box, tub, or sack for taking fish or shellfish in the state; possession of such a device carries a presumption of guilt. Licenses and names of boats registered for purposes of this chapter must be kept in plain view. No inspector or other officer apprehending any person

for any violation of fish or shellfish laws is authorized to settle with such offender or release him from any resulting legal proceedings. (Kelly-Florida)

VIRGINIA INSTITUTE OF MARINE SCIENCE.

Va Code Ann secs 28.1-195 thru 28.1-200 (1969).

Descriptors: *Virginia, *Investigations, *Research facilities, *Water resources development, Fish conservation, Commercial fishing, Recreation, Administrative agencies, Foundation investigations, Data collections, Exploration, Planning, Feasibility, Surveys, Legislation, Legal aspects, Atlantic Ocean, Tidal waters, State jurisdiction, Fisheries, Marine fisheries.
Identifiers: Marine pollution.

The Virginia Institute of Marine Sciences shall be continued as an independent research and service agency. The duties of the Institute include conducting investigations of areas used by seafood and sport-fishing industries, advising the Commission of Fisheries regarding conservation of fisheries' resources, studying marine pollution, making hydrographic and biological studies of the tidal waters of the state and contiguous waters of the Atlantic Ocean, and making other studies as requested by the governor. The Institute may enlist the aid of public or private agencies in conducting its studies and research. It may take any marine organism from the waters of the state, with approval of the Commission of Fisheries, for purposes of carrying out its assigned tasks. (Kelly-Florida)

ATLANTIC STATES MARINE FISHERIES COMPACT.

Va Code Ann sec 28.1-202 (1969).

Descriptors: *Virginia, *Interstate compacts, *Fish conservation, *Interstate commissions, Water resources development, Fish management, Atlantic Ocean, Fisheries, Fish stocking, Commercial fishing, Administrative agencies, Wildlife conservation, Legislation, Legal aspects, Regulation, State jurisdiction.

The purpose of the Atlantic States Marine Fisheries Compact is to develop a program for promotion and protection of Atlantic seaboard fisheries and to prevent physical waste of the fisheries from any cause. The Atlantic States Marine Fisheries Commission is hereby created and is composed of representatives from each state adopting the Compact. The Commission is responsible for discovering methods which prevent depletion and waste of fisheries and is empowered to recommend specific coordination of the police powers of the member states. The Commission may draft recommended legislation, advise pertinent administrative agencies, and plan use of jointly stocked waters. The Fish and Wildlife Service of the United States Department of the Interior serves as the primary research agency of the Commission. Nothing in the Compact shall prevent a member state from enacting additional conservation laws, nor shall any provision be construed to repeal a state law. States consenting to an amendment set forth in the Compact may agree to have the Commission serve as a joint regulatory agency for specific fisheries in which such states have a joint interest. (Kelly-Florida)

PERMISSION TO CAPTURE FLOODWATERS.
Va Code Ann secs 62.1-107 thru 62.1-115 (1968).

Descriptors: *Virginia, *Riparian rights, *Water storage, *Floodwater, Permits, Average flow, Water permits, Water levels, Riparian land, Ownership of beds, Diversion structures, Watershed management, Administration, Water rights, Legislation, Projects.

Riparian owners wishing to capture floodwaters must apply to the circuit court in the county where the waters will be stored. The Commissioner of Water Resources then prepares a report showing the average flow at the point where the water will be taken, any conflicts with proposed projects in the watershed, and the effects of the proposed capture on pollution abatement. The court bases its decision on the petition and the report. The state consents to the use of watercourse beds to which it has title for the construction of impounding facilities. Riparian owners storing floodwaters have unrestricted use thereof. (McDonough-Florida)

Identifiers: *Commerce.

The Division of Ports of the Department of Conservation and Development is abolished. The Virginia State Ports Authority is created. To unify and promote the development of the port facilities within the municipalities of the state, the governing body of any such city shall have the power to appoint boards of municipal port commissioners. These boards may be delegated any or all of the authority with regard to the ownership, operation, and management of the port terminal facilities within such municipalities. The Board of Commissioners of the Virginia Ports Authority may engage in promoting, developing, constructing, maintaining, and operating the harbors and seaports within the state. The Authority's general purposes include: (1) development of harbors and seaports for the handling of water-borne commerce; (2) improvement of such port facilities and issuance of revenue bonds for this purpose; (3) stimulation of the use of such harbors; (4) issuance of a publication of all port charges, rules, and practices; and (5) performance of any act to increase commerce through such harbors and seaports. The Authority is vested with the power of eminent domain. The Authority may lease such port facilities to the respective city, county, or town. (Schram-Florida)

VIRGINIA BEACH EROSION COMMISSION.

Va Code Sec 62.1-154 (1968).

Descriptors: *Virginia, *Erosion, *Beach erosion, *Erosion control, Legislation, Check structures, Conservation, Jetties, Sea walls, Shore protection, Sands, Beaches, Construction, Maintenance, Right-of-way, Shores, Coastal engineering, Tidal effects, Local governments, Administrative agencies, Cities, Regulation.

The Virginia Beach Erosion Commission shall have all of the powers necessary and convenient to carry out the purposes for which it is created. The general purpose of the Commission is to stop or correct erosion along the Atlantic coast in the city of Virginia Beach. The Commission shall have the power: (1) to construct and maintain jetties, groins, and seawalls; (2) to place sand upon the beach for the purpose of controlling erosion; (3) to acquire land, rights-of-way, sand or any kind of material to attain the objects of the Commission; (4) to improve, beautify, maintain, and preserve the ocean front; and (5) to make rules and regulations not inconsistent with law to carry out the general purposes of the Commission. The council of the city may appropriate such funds as it deems necessary to carry out the purposes of the Commission. The Commission also may: (1) sue and be sued; (2) contract with any person, firm, or corporation; (3) make and execute necessary instruments; and (4) accept and expend any gift, grant, or donation from any public or private source. (Schram-Florida)

SALE OF CORPORATE PROPERTY AND GRANTING OF FRANCHISES BY CITIES AND TOWNS.
Va Const Art VIII, sec 125, 1968.

Descriptors: *Virginia, *Cities, *Leases, *Public lands, Legislation, Legal aspects, Permits, Easements, Public utilities, Docks, Bridges, Railroads, Public rights, Compensation, Competitive prices, Local governments, Grants, Bids, Contracts.
Identifiers: Wharves.

No city or town may sell its rights in and to its water front, wharf property, public landings, wharves, docks, and bridges except by an ordinance or resolution passed by a recorded affirmative vote of three-fourths of all the members elected to the council. No franchise, lease, or right of any kind to use any such public property or easement of any description, in a manner not permitted to the general public, shall be granted for a period longer than thirty years. Before granting any such franchise, the municipality must first, after due advertisement, receive bids therefor publicly. Such grant may provide that, upon termination of the grant, the plant as well as the property thereupon becomes the property of the municipality. The above may be without compensation or upon the payment of fair value, but the grantee is entitled to no payment by reason of the value of the franchise. Such municipality may then sell or lease any acquired plant or property or control and operate the same. (Schram-Florida)

PARKS AND RECREATIONAL AREAS.
RI Gen Laws Ann sec 32-1-3 (1968).

Descriptors: *Rhode Island, *Recreation facilities, *Riparian rights, *Water resources development, Beaches, Facilities, Recreation, Flow, Natural flow, Dams, Dam construction, Condemnation, Eminent domain, Land development, Land management, Administration, Administrative agencies, Boating, Water sports, Fishing, Resource development, Natural resources, Legislation, Parks, Water rights, Conservation.

The Department of Natural Resources may acquire by gift, purchase, condemnation, or devise lands, easements, rights and interests in land for parks, recreation grounds, or bathing beaches in any part of the state, provided that all such property, other than tide-flowed lands acquired by condemnation, shall remain subject to all rights of riparian proprietors on any waters bordering upon such property. All such riparian proprietors have the right to: continue to maintain, repair, or reconstruct dams and appurtenances now existing on such waters; enter upon such property restoring it to its previous condition; and enjoy the same rights of flowage heretofore enjoyed. Subject to these provisions, the Department may permit the use of property acquired under this section and the waters bordering thereon for bathing, boating, fishing, and skating. The Department has the same authority over such lands as it has over other property acquired by law. (Smith-Florida)

ATLANTIC STATES MARINE FISHERIES COMPACT.

RI Gen Laws Ann secs 20-8-1 thru 20-8-12 (1968).

Descriptors: *Rhode Island, *Interstate compacts, *Interstate commissions, *Fisheries, State governments, Federal government, Fish management, Fish stocking, Conservation, Administrative agencies, Water law, Legislation, Political aspects, Maine, New Hampshire, Massachusetts, Connecticut, New York, New Jersey, Delaware, Maryland, Virginia, North Carolina, South Carolina, Georgia, Florida, Commercial fishing, Financing.
Identifiers: Atlantic states fisheries.

The purpose of the Atlantic States Fisheries Compact is to protect fisheries and prevent their physical waste. The Atlantic States Marine Fisheries Commission, composed of three representatives from each member state, recommends conservation practices and methods to avoid fisheries' waste. The Commission may act as a joint regulatory agency for fisheries of the states. It may recommend legislation to the party states and is available to consult with state agencies. The Commission is supported by annual appropriations of member states and may use the United States Fish and Wildlife Service as its primary research agency. (McDonough-Florida)
W70-01336

LICENSING AND REGULATION OF FREE AND COMMON SHELLFISHERIES.

RI Gen Laws Ann secs 20-9-1, 20-9-2, 20-9-6, 20-9-10, 20-9-12, 20-9-13 (1968).

Descriptors: *Rhode Island, *Commercial shellfish, *Shellfish, *Commercial fishing, Permits, Fishing gear, Farm ponds, Fish, Fisheries, Trawling, Administrative agencies, Legislation, State governments, Legal aspects, Boats, Regulation, Fish stocking, Fish farming, Fish reproduction, Aquiculture, Fish conservation, Clams, Oysters, Mussels, Water conservation, Dredging.
Identifiers: *Scallops, Quahaugs.

In order to take oysters, clams, or quahaugs from the free and common fisheries in Rhode Island waters, persons must obtain a license from the Director of Natural Resources. The Director also issues boat registrations for the taking of oysters, clams, and quahaugs and makes and enforces regulations governing registrations and licenses. No person, however, may take oysters from the free and common oyster fisheries between the dates specified. State residents may without a license take as much as one-half bushel of oysters in any one day. The use of dredges for the taking of oysters, clams, quahaugs, scallops, and mussels is herein regulated. Dredging for sea clams or skimmers is permitted in specified areas. This Act establishes number and size limits for shellfish which may be taken. The Director of Natural Resources, in order to preserve and insure the future growth of oysters in Charlestown pond and Green Hill pond, is responsible for transplanting seed oysters to more favorable locations. (Marsee-Florida)
W70-01337

OYSTER GROUND LEASES.

RI Gen Laws Ann secs 20-10-1 thru 20-10-3, 20-10-5, 20-10-7, 20-10-9, 20-10-12, 20-10-19, 20-10-22 (1968).

Descriptors: *Rhode Island, *Leases, *Oysters, *Commercial shellfish, Land tenure, Regulation, Legal aspects, Administrative agencies, Legislation, State governments, Jurisdiction, Shellfish, Aquiculture, Commercial fish, Mollusks, Tidal waters, Land development, Wetlands, Mud flats, Contracts, Rent, Beds, Beds under water, Administration, Supervisory control (Power), Surveys.
Identifiers: *Oyster grounds, Shellfish cultivation.

The Director of Natural Resources may lease oyster grounds, within the limitations and terms herein set forth, for the purpose of oyster culture and business. Lease terms vary depending upon the depth of tidewater covering such grounds at mean low tide. In general, lands must be covered by at least four feet of water. Exceptions are made for specified areas. Deep water leases, where the depth of such waters is at least at twelve feet, are allowed in Naragansett Bay and tributaries. Leases may be renewed. The Director may lease soft or mud bottom lands for the purpose of having such lands made suitable for oyster and shellfish planting and cultivation. It is unlawful for persons to wrongfully make claim upon public oyster grounds, and penalties are provided. Specified grounds are not subject to lease, and special rules exist for given ponds. Before leasing lands, the Director has the lands surveyed, platted, and properly marked with stakes or buoys. The Director supervises the care and removal of such stakes and buoys. Oysters planted or growing in privately leased oyster grounds are the lessee's property. (Marsee-Florida)
W70-01338

ERADICATION OF STAR FISH.

RI Gen Laws Ann secs 20-20-1 thru 20-20-7 (1968).

Descriptors: *Rhode Island, *Fish management, *Pest control, *Water resources development, Animal control, Control, Fishing, Fishkill, Fish, Fish harvest, Wildlife conservation, Spawning, Fish reproduction, Permits, Weight, Dredging, Administration, Adminstrative agencies, Regulation, Government finance, Costs, Financing, Legislation, Supervisory control (Power), Fish conservation.
Identifiers: Star fish eradication.

The general assembly annually appropriates money for the eradication of star fish in the waters of

Rhode Island and for a suitable bounty for such star fish. The controller may draw on the general treasury for such sums approved by the Director of Natural Resources for such purposes. The Director designates fishing zones for star fish, strategically located so as to break up star fish spawning beds. The Department of Natural Resources issues permits for each boat used to dredge for star fish. The bounty must be set between seventy-five cents and one dollar per hundred pounds of star fish, and the Department must designate the locations of three weighing stations to be used in weighing each licensee's catch. No bounty is paid for star fish taken from leased grounds or for star fish dredged by oyster companies. Such fishing is legal only between sunrise and sunset, Tuesday through Sunday, and only approved trawls and dredges are permitted. The Director makes rules and regulations necessary to carry out the provisions of this chapter. (Smith-Florida)
W70-01339

BLASTING REGULATIONS.

Pa Stat Ann Tit 73, sec 166 (Supp 1969).

Descriptors: *Pennsylvania, *explosives, *Standards, *Administration, Control, Governments, Explosions, Highways, Streams, Rivers, Regulation, Administrative agencies, Channels, Permits.

The use of explosives for blasting in the neighborhood of any public highway, stream of water, dwelling house, or pipe line shall be done in accordance with the provisions of this section and rules and regulations promulgated by the Department of Labor and Industry. Standards for blasting and standards for instruments for determining the particle velocity of blasts are established. Blasting near streams is prohibited in all cases where the effect of the blasting is liable to change the course or channel of any stream, unless a permit is first obtained from the Department. THE ROLE OF THE PUBLIC DISTRICT IN THE INTEGRATED MANAGEMENT OF GROUND AND SURFACE WATER,
Colorado State Univ., Fort Collins.
Stephen C. Smith.
Economics and Public Policy in Water Resource Development, edited by S C Smith, and E N Castle, Ames, Iowa State University Press, p 341-352, 1964. ref.

Descriptors: *Water districts, *Groundwater, *Surface water, *Water rights, *Water conservation, *Economics, *Regional planning, River basin, Compaction, Reservoirs, Overdraft, Wells, Floods, Recreation, Dams, Percolation, Irrigation, Compensation, Recharge, Discharge.
Identifiers: *Public districts, *Nonappropriation states, *Cyclic fluctuations, *Interregional transport, Storm-water drainage.

In this article, the public district is discussed as a public agency which is used in organizing integrated management of ground and surface water. Through the organizational process, integration can be achieved among both internal and external interests if the district has the legal, political and economic responsibility to perform this function. The public district is therefore an agency for collective action. This agency can function both where there is no state statutory administration of water rights and in appropriative states, especially in enacting programs such as combating physical uncertainties due to cyclic fluctuations, salt-water intrusion or compaction. Some management practices of the district may affect the legal status of water rights. The district can act to settle conflicts of interest internally by integrating the management of ground and surface water. The district can serve to relate repayment of a current investment in water utilization facilities to economic benefits accruing to the area over time. Finally, the district can represent internal interests within the district on a common basis to external interests in water management. (Murphy-Rutgers)

ORGANIZATIONS AND WATER RIGHTS IN THE RURAL-URBAN TRANSFER OF WATER,
Colorado State Univ., Fort Collins.
Stephen C. Smith.
Economics and Public Policy in Water Resource Development, edited by S C Smith, and E N Castle, Ames, Iowa State University Press, p 353-367, 1964. 15 p, 40 ref.

Descriptors: *Water allocation, *Economics, *Water rights, *Prior appropriation, *Riparian rights, Water resource development, Water policy, Cost-benefit analysis, Decision making, Water districts, Government, Cities, Surface water, Irrigation, Economic efficiency, Wells, Groundwater.
Identifiers: *Rural/urban competition, *Institutional machinery, *Correlative rights, *Beneficial use.

This article deals with the role of institutions in water economics, a delineation of institutional machinery, a definition of water rights as related to economic change, and economic competition within and between organizations. The economics in water policy is chiefly concerned with the problem of allocating water between rural and urban uses. Since this problem involves water rights, it is closely bound to public policy in which laws and institutions are used to represent values in the decision-making process. The institutions involved in water transfer encompass public districts, municipalities, state government and federal government. These are all concerned with the water problems of appropriative rights, riparian rights, correlative rights, and beneficial use. In the rural-urban transfer of water use, the economics involved call for study of water rights as real property, urban expansion, and inter-agency/intra-agency conflicts. Large interregional transfer agencies have become the predominant organizations in dealing with these difficulties, and the internal policies of such organizations have become more important in the problems than they were before, reflecting the dynamic character of the economy. (Murphy-Rutgers)

WATER RESOURCES: COMMENTS UPON THE FEDERAL-STATE RELATIONSHIP,
California Univ., Berkeley.
Sho Sato.
Economics and Public Policy in Water Resource Development, edited by S C Smith, and E N Castle, Ames, Iowa State University Press, p 317-337, 1964. 21 p, 111 ref.

Descriptors: *Economics, *Water rights, *Water law, *Riparian lands, *Flow control, *Federal reservations, Reclamation, River basins, Dams, Rivers, Water use, Tributaries, Water resources, Streams, Streamflow.
Identifiers: *Pelton dam, *Navigation servitude, Laissez-faire.

This article reviews and explores briefly two Congressional powers which have served as the basis for Congressional jurisdiction over water resources. These are the power to regulate interstate commerce and the power to regulate and dispose of the property of the United States. Until now, the power granted under the commerce clause has only related to navigation. A corollary, however, introduces the issue of whether or not the plenary power of Congress over navigable streams permits interference and even destruction of existing water uses with respect to watercourses within that power without compensation. As far as the property clause is concerned, a fog enshrouds congressional disruptive power over streams, rivers, and tidewaters within the realm of public domain. Several pieces of new legislation have been proposed to end these difficulties, although a potent argument exists to avoid complete state control of these issues in favor of the economic and available through the Federal government. Recent Supreme Court decisions have held that the United States has proprietary interest in any waters in which rights are unrecognized and Congress can repeal State statutes granting such rights to reserve the water for federal control or disposition. THE ROLE OF GOVERNMENT IN A FREE SOCIETY,
Chicago Univ., Ill.
Milton Friedman.
Controlling Pollution: The Economics of a Cleaner America, edited by M. I. Goldman, Englewood Cliffs, Prentice-Hall, p 73-81, 1967. 9 p.

Descriptors: *Government, *Economics, *Technology, Public lands, Monopoly, Resource allocation, Land, Railroads, Political aspects, Value, Prices, Legal aspects, Riparian rights.
Identifiers: *Freedom, *Neighborhood effects, *Free society, Unanimity, Market, Patents.

This article deals with the role of government and stresses that the use of political channels rarely involves a question on which the public holds a unanimous feeling. Unanimity is stressed as an ideal. Due to the fact that this ideal is not present in our society, the author suggests that the government plays a role of umpire in resolving conflicts among the freedoms of different individuals. Several freedoms are cited, including freedom to combine, freedom to compete, property rights, and the monetary system. In our free society, the organization of economic activity through voluntary exchange is supervised through governmental maintenance of law and order. In other words, government serves to determine, arbitrate and enforce the rules of the market. This article has relevance to water resource policy makers in delineating the author's view of the proper extent of government's intervention in the market economy. (Murphy-Rutgers)

POLITICS AND ORGANIZATION IN WATER RESOURCE ADMINISTRATION: A COMPARATIVE STUDY OF DECISIONS,
Syracuse Univ., N.Y.
Frank Munger, and Anne Houghton.
Water Resources Research, Vol 1, No 3, p 337-347, Third Quarter 1965. 11 p, 1 tab, 34 ref.

Descriptors: *Water resources, Decision making, Political aspects, Reservoirs, Water supply, Flood control, Benefits, Natural resources, Resource development, Surface waters, Administrative agencies, Flow.
Identifiers: *Politics, *Water resources administration, Organizational arrangements, Governmental control, Decisions, Public agency, Private agency.

This paper represents an attempt to suggest one procedure by which a number of decisions concerning resource development can be brought together and interpreted in such a way as to support generalizations about resource policy making. The area of concern is limited to water resources and is focused specifically on a relationship between political pressures and the decision as to the kind of agency, public or private, that is to administer a specific project for the control of surface flows. The paper is restricted in two principal ways. First, it is confined to water resource decisions concerning the control of surface waters and excludes both projects involving the development of groundwater and the very substantial investment in the treatment of wastes. Secondly, it focuses upon only one aspect of such decisions, the designation of the

administrative agency or enterprise that will assume the responsibility for the operation of control reservoirs. (Loeb-Rutgers)

RIVER BEDS.

Pa Stat Ann Tit 64, secs 262-265 (1959).

Descriptors: *Pennsylvania, *River beds, *Minerology, *Ownership of beds, Legislation, Legal aspects, Beds, Navigable rivers, Low water mark, Mining, Iron, Coals, Limestones, Gravels, Sands, Navigation, Dams, Canals, Banks, Riparian rights, Administrative agencies, Surveys.
Identifiers: Warrants of state lands.

When application is made to the Secretary of Internal Affairs for a warrant of state land, he directs the appropriate county surveyor to survey so much of the bed of any public navigable river as is called for in the application. Specific procedures for the survey are provided. The right to dig and mine minerals vests in the warrant grantee provided: the right is not exercised so as to interfere with navigation or the rights of persons holding property on the banks of the river; and, the right is not exercised so as to undermine the bed of any river within one hundred yards of any dam, lock, or other structure erected to improve navigation. Any person holding a warrant may, within ten years after its issuance, receive a patent for the land described therein upon payment of the usual price per acre for public lands. No part of this act will be construed to grant any right to the surface of the bed of any river; but any rights acquired hereunder are confined to sinking shafts and mining beneath the beds of such rivers. LEGISLATIVE RESTRICTIONS.

Miss Const Art 4, secs 81, 90 (g).

Descriptors: *Mississippi, *Navigable waters, *Bridges, Legislation, Public lands, Railroads, Construction, Chutes, Fish, Fishing, Eminent domain, Watercourses, Lumbering, State governments, Transportation, Safety, Barriers, Navigation.
Identifiers: *Obstructions to navigation.

The legislature shall never authorize the permanent obstruction of any of the navigable waters of the state. The legislature may provide for the removal of any existing obstructions whenever the public welfare demands. This section shall not prevent the construction, under proper authority, of drawbridges for railroads or other roads, or the construction of booms and chutes for logs when the safe passage of vessels is not prohibited. The legislature shall not pass local, private, or special laws: (1) granting the right to have any ferry, bridge, road, or fish-trap; (2) relating to stock laws, water-courses, and fences; (3) conferring the power to exercise the right of eminent domain; and (4) granting any lands under control of the state to any person or corporation. Such matters shall be provided for only by general laws. (Schram-Florida)

BRIDGES AND TUNNELS ACROSS TRIBUTARIES OF THE GULF OF MEXICO AND MISSISSIPPI SOUND.

Miss Code Ann secs 8447-01 thru 8447-36 (1956).

Descriptors: *Mississippi, *Bridges, *Highways, *Bridge construction, Gulf of Mexico, Eminent domain, Costs, Construction, Road construction, Engineering structures, Tunnel construction, Construction costs, Cost allocation, Legislation, Legal aspects, State governments, Federal government, Financing, Project planning, Administrative agencies, Assessments, Benefits.

The state highway commission is authorized to construct and maintain bridges, tunnels, or causeways across any tidewater, bay, or river tributary of the Gulf of Mexico or Mississippi Sound. The cost of these projects may be financed by bonds. The commission may accept funds from the federal government and may exercise eminent domain to acquire bridge sites. Each project shall be regarded as part of the state highway system. A bridge district, for the purpose of constructing and operating an interstate bridge, may be established. A commission may then be appointed by the county court to plan construction of the bridge and to assess costs on the basis of benefit to landowners, both public and private. The commissioners may collect tolls for transit over the bridge. The commissioners are empowered to negotiate contracts with the federal or state governments and to acquire real estate by eminent domain. (Kelly-Florida)

Identifiers: *Licensing.

Powers of the Game and Fish Commission are outlined, which generally provide for the protection, distribution and regulation of wild game and fish. Duties and powers of wardens and other peace officers are established, and fines and penalties for violations of fish and game laws are prescribed. Provisions are made for fees and licenses for resident and non-resident sport fishermen, commercial fishermen, wholesale dealers, and minnow dealers. Alligators are protected, and frogs and turtles may be taken for commercial use only by license or special permit. Lawful methods of taking fish are prescribed, and certain methods are expressly prohibited. Reciprocal licensing and regula-

tions are authorized with Arkansas and Louisiana for adjoining waterbodies. (Douberley-Florida)

GAME AND FISH.

Miss Code Ann secs 5844, 5844-01, 5844-11, 5856, 5857, 5862, 5862.5, 5863, 5866 (1952), as amended, (Supp 1968).

Descriptors: *Sport fish, *Fishing, *Fish management, *Recreation, Fish, Regulation, Freshwater fish, Fish conservation, Wildlife conservation, Fish stocking, Fisheries, Administrative agencies, Permits, Flooding, Fishkill, Non-consumptive use, Wildlife management.
Identifiers: Penalties.

The Game and Fish Commission is authorized to make rules and regulations, to inaugurate surveys, and to establish services as necessary. It is empowered to vary prescribed fishing seasons if necessary for the preservation of a species, to designate protected areas, to acquire land for sport and recreation, to stock or restock lands or waters, to have exclusive control over the propagation and distribution of wild game and fish, to regulate the taking of non-game gross fish, and to issue fishing permits. The Commission may acquire lands inundated by waters behind a structure built to prevent the drying up of a natural waterbody. Duties and powers are provided for the Director of Conservation, the game and fish wardens and other peace officers. Funds collected by the Commission are used by it, except that a portion of fines collected goes to the county with jurisdiction over the violation. Fines and penalties for violations of laws and regulations are prescribed. (Douberley-Florida)

Descriptors: *Commercial fish, *Sport fish, *Permits, *Fishing, Fish farming, Reservoir fishing, Nets, Minnows, Commercial fishing, Bait fishing, Fishing gear, Freshwater fish, Frogs, Turtles, Regulation, Fish conservation, Fish control agents.
Identifiers: Fishing permits, Alligators, Interstate cooperation.

Resident licenses are issued to citizens who have been residents in the state for six months. Wholesale minnow dealers are licensed by the Game and Fish Commission, and fees are set out for resident and non-resident dealer licenses. Frogs or turtles may not be taken for commercial use without a resident license or a special permit. It is unlawful to hunt, kill or catch alligators. Lawful means of taking game fish are specified, and the use of chemicals, explosives or electricity to take any fish is prohibited. Game fish taken by nets or seins must be immediately returned to the water. Taking of non-game gross fish in certain reservoirs and rivers may be regulated by the Commission. Game fish may not be sold unless grown in a private pond, and fish dealers may not possess game fish. Fees and regulations are provided for commercial, resident and non-resident fishing and wholesale dealer licenses. The Commission may negotiate with Arkansas and Louisiana to effectuate reciprocal regulations and licensing with relation to the Mississippi River area and the Pearl River. (Douberley-Florida)

REGULATIONS REGARDING CLAMS AND SCALLOPS.

Va Code Ann secs 28.1-160 thru 28.1-163 (1969).

Descriptors: *Virginia, *Fish management, *Shellfish, *Commercial shellfish, Clams, Commercial fishing, Permits, Fish conservation, Legislation, Legal aspects, Oysters, Administrative agencies, State jurisdiction, Water pollution, Taxes.
Identifiers: Scallops.

Every person engaged in the business of buying, marketing, and shipping scallops, clams, and bivalves, other than oysters from within the state, must pay an annual license tax. If anyone is found in possession of oysters while engaged in taking clams or scallops during the season in which taking oysters from natural rocks, beds, or shoals is prohibited, he is presumed guilty of violating the statute regulating oyster fishing. The Commissioner of Fisheries is authorized to dredge clams in polluted areas for the purpose of replanting in public clamming grounds. The commissioner may be his own authority or upon petition set aside any ground in the state's waters, not previously assigned for planting or bathing purposes, as a public clamming or scalloping grounds. A season for catching scallops, as well as a minimum size requirement, is established by the statute. (Kelly-Florida)

Identifiers: Obstruction to navigation.

Any person owning land upon a watercourse may erect a wharf, pier, or bulkhead on said watercourse; provided, navigation is not obstructed, nor the private rights of any person be otherwise injured thereby. The circuit court of the country in which such structure is located may abate the same if navigation is obstructed or any private landing is encroached upon. Any person desiring the privilege of erecting a wharf at or on any county landing may, after giving notice of his intention, present to the circuit court of the county a petition for such privilege. The court may determine the same and may, in its discretion, grant such privilege and fix such rates and charges upon such conditions and limitations as to it may seem fit. The court, at any subsequent term, may revoke such privilege, alter such conditions or limitations, or regulate the rates and charges. This section is not intended to authorize a circuit court to grant the privilege of erecting a wharf within a city. (Schram-Florida)

Descriptors: *Virginia, *Boating, *Water sports, *Safety, Recreation, Public health, Boating regulations, Swimming, Water skiing, Administrative agencies, Local governments, Coast guard regulations, Legislation, Surf-boarding, Permits, Recreation facilities, Boats, State governments, Social aspects.

The declared policy of the state is to promote safety for persons and property in and connected with the use, operation, and equipment of vessels. The Commission of Game and Inland Fisheries shall enforce and administer the provisions of this chapter. All expenses required for administration and enforcement of this chapter shall be paid from the funds collected pursuant to this chapter. Every motorboat on the waters of the state must bear identification numbers. Any person owning land bordering on any waters of the state may petition the Commission to authorize the placing of markers around a public swimming area at the expense of the petitioner. A motorboat need not be numbered if it is either federally registered, a foreign vessel, lifeboat, racing boat, or under ten horsepower. Waterskiing is regulated. Skiing in public swimming areas is prohibited. Any local government may, if permitted by the Commission, make additional regulations. Provisions for the enforcement and punishment of violations of the chapter are included. (Schram-Florida)

COMPACT AND BOUNDARY BETWEEN VIRGINIA AND MARYLAND.

Va Code Ann sec 7.1-7 (1966).

Descriptors: *Virginia, *Maryland, *Boundaries (Property), *State jurisdiction, Legislation, Boundary disputes, Legal aspects, Political aspects, Navigation, State governments, Interstate compacts, Interstate rivers, Fish conservation, Water conservation, Channel improvement, Riparian rights, Public benefit.

The 1785 compact between Virginia and Maryland remains obligatory except so far as it may have been superseded by the provisions of the United States Constitution. The compact provides that citizens of each state shall have full property rights in the shores of the Potomac adjoining their lands. Fishing rights are to be common and equal to citizens of both states. Mutual statutes shall be made for the preservation of fish, preserving the channel, and maintaining navigation in the Potomac. Jurisdiction for piracies, crimes, and offenses committed in the waters dividing the states is discussed in detail. The boundary line between Virginia and Maryland, established in 1878, is described in detail. This also is declared to be still in effect and binding upon the states and the citizens thereof. Numerous provisions for mutual jurisdiction, the reach of process into the adjoining state, and property disputes are outlined. (Schram-Florida)

CROSSINGS AND CONNECTIONS.
Va Code Ann secs 56-16, 56-17, 56-32, 56-34 (1969).

Descriptors: *Virginia, *Canals, *Roads, *Utilities, Industries, Canal construction, Highways, Streams, Administrative agencies, Administration, Judicial decisions, Industrial water, Local governments, Governments, Legislation, Public utilities, Obstruction to flow.

Every public service corporation whose canal passes through any person's land shall provide a suitable wagonway across such canal upon written request of the landowner. Failure to provide a wagonway within ten days after request, enables the landowner to apply to the circuit court of the county to have a board of commissioners appointed to decide if a wagonway should be constructed. The company shall be fined five dollars per day for failure to provide such wagonway as ordered. A public service corporation may cross the canal of another such corporation. However, such crossing shall in no way impair operations of the canal to be crossed. No state highway, county road, stream, or watercourse shall be altered, closed, or obstructed by any public service corporation without the approval of the State Highway Commissioner and any other governing body involved. Such corporation shall provide a highway or waterway in lieu of the one so altered or closed. The General Assembly reserves the right to connect any company's canal with any other company's canal. (Smith-Florida)

HARBORS AND HARBOR LINES.
RI Gen Laws Ann secs 46-4-1 thru 46-4-8 (1956), as amended, (Supp 1968).

Descriptors: *Rhode Island, *Harbors, *Tidal waters, *Local governments, Coastal engineering, Navigation, Coasts, Planning, Regulation, Port authorities, Boats, Ships, State jurisdiction, Transportation, Legislation, Legal aspects, Administrative agencies, Administration.
Identifiers: Harbor lines.

After holding prescribed public hearings, the Director of Public Works may mark out and plot harbor lines to be established in any of the state's public tidewaters. The recommended harbor lines must be approved by the governor and senate before they become effective. The council of any municipality is authorized to appoint a harbor master for harbors within its jurisdiction. The city of Providence is given an expanded jurisdiction for purposes of this statute. Specific towns are authorized to regulate speed, management, and control of all vessels within their respective boundaries by ordinance. These towns may also regulate the size, type, location, and use of all anchorages and moorings within their respective harbors. None of the powers granted to municipalities by the statute are deemed to supercede the authority of the state Director of Public Works over the public tidewaters of the state. (Kelly-Florida)

FOREST GAME FISH AND RECREATION RESERVES.

Va Code Ann secs 10-22 thru 10-26, 10-31 (1964).

Descriptors: *Virginia, *Forest management, *Administration, *Wildlife management, Forests, Land use, Lumbering, Recreation, Hunting, Fishing, Land development, Land management, Permits, Income, Operating costs, Taxes, Administrative agencies, Governments, Legislation.

The owner of any forest or timber land may offer the same, subject to pasturage, to the Department of Conservation and Development as a forest, game, and recreation reserve. If such land is accepted by the State Forester, the owner shall deliver a written lease to the Director, leasing the land and all hunting, fishing, and recreational rights to Virginia until the timber thereon shall become suitable for marketing as lumber. The State Forester shall aid in the development and protection of such lands. The Commission of Game and Inland Fisheries is authorized to sell hunting, fishing, and limited recreational privileges on any reserve so created. All funds accrued from the sale of privileges on such reserves shall be paid into a state fund to be used for the administration, protection, development, and taxation of the reserve lands. No tax or local levy shall be paid unless the owner desires to do so. Such taxes shall be deferred until such time as the timber on the reserve is marketed. The Director and the Commission are authorized to promulgate and enforce rules and regulations governing the reserve. (Smith-Florida)

FRESH WATER FISHING.
R I Gen Laws Ann secs 20-21-1 thru 20-21-21 (1968).

Descriptors: *Rhode Island, *Fish management, *Fish conservation, *Regulation, Control, Fishing, Fish, Fish harvest, Wildlife conservation, Spawning, Fish reproduction, Permits, Administration, Administrative agencies, Trout, Bass, Rivers, Ponds, Streams, Legislation, Bait fishing, Ice fishing, Equipment, Commercial fishing, Sport fishing, Nets, Fisheries, Fishing gear, Fish stocking.

With certain exceptions, closed seasons, maximum daily catches, and a minimum size are established for game fish. The purchase and sale of certain varieties of fish is prohibited. Unless privately owned, no stream or pond may be stocked without approval of the Department of Natural Resources. Placing any substance injurious to fish in any stream or pond is prohibited, except as otherwise provided by law. Methods of catching fish and equipment used therefore are regulated. (Smith-Florida)
W70-01633

MINNOWS; RECIPROCAL ENFORCEMENT OF FISHING LAWS.
R I Gen Laws Ann secs 20-22-1 thru 20-22-8, 20-23-1 (1968).

Descriptors: *Rhode Island, *Minnows, *Fish management, *Interstate compacts, Interstate rivers, Control, Animal control, Fishing, Nets, Weirs, Management, Permits, Fish, Wildlife conservation, Spawning, Fish reproduction, Administration, Administrative agencies, Regulation, Baits, Bait fishing, Legislation, Bait traps, Supervisory control (Power), Fish conservation, Water resources development.

A license is required to engage in the minnow business or to possess more than one hundred live freshwater minnows at one time. Lawful methods for taking freshwater minnows are set out. The Director of Natural Resources is authorized to make additional regulations concerning the methods, times, numbers, and seasons for taking freshwater minnows. There is provision for interstate cooperation in the enforcement of fishing laws. (Smith-Florida)
W70-01634

CONDEMNATION FOR WATER SUPPLY PURPOSES.
R I Gen Laws Ann sec 39-15-1 (1956).

Descriptors: *Rhode Island, *Condemnation, *Water supply, *Local governments, Dams, Water, Water demand, Water requirements, Water works, Water resources, Water resources development, Eminent domain, Right-of-way, Legislation, Contracts, Supply contracts, Reservoirs, Pumping, Pumping plants, Highways, Highway relocation, Bridges, Bridge construction.

Whenever the electors of any town have voted to provide a water supply for the inhabitants of such town, or whenever any town has made contracts for such a water supply, then such town, or the party bound to fulfill such contract, may take, condemn, hold, use, and permanently appropriate any land, water, rights of water and of way, necessary for furnishing or enlarging any such water supply, including sites and materials for dams, reservoirs, pumping stations, and coal houses, with right-of-way across public or private lands, including lands to be covered by water. The grade of any highway may be altered and bridges therein built for the accomodation of such water supply. (Smith-Florida)
W70-01635

WATER FENCES.
R I Gen Laws Ann secs 34-10-6 thru 34-10-8 (1956).

Descriptors: *Rhode Island, *Barriers, *Marshes, *Animal control, Limiting factors, Tidal marshes, Ocean water, Cattle, Sheep, Domestic animals, Riparian rights, Riparian land, Control, Regulation, Land use, Legislation, Legal aspects.
Identifiers: Water fences, Trespass.

Coterminous owners or possessors of land adjoining water, whenever their land is under improvement, shall maintain a sufficient water fence to prevent trespass by cattle in the same manner as other partition fences are directed by this chapter. All tracts of marshland so exposed to the sea as to render partition fences impracticable are exempt from this chapter. The owner of any marshland so exempted has the remedies for trespass provided in other cases if any person permits his cattle, sheep, horses, or hogs to run upon such marshland. (Smith-Florida)
W70-01636

SOVEREIGNTY AND STATE JURISDICTION; COUNTY JURISDICTION.

R I Gen Laws Ann secs 42-1-1, 42-1-3, 42-3-6 (1956).

Descriptors: *Rhode Island, *State jurisdiction, *Boundaries (Property), *High water mark, Jurisdiction, Federal jurisdiction, Legal aspects, Governments, Legislation, Shores, Coasts, National seashores, Boundaries (Surfaces), Local governments, Bays, Waters, Rivers, Streams.
Identifiers: Headlands.

The territorial limits of this state extend one marine league from its seashore at high water mark. When an inlet does not exceed two leagues between its headlands, a straight line from one headland to the other is equivalent to the shore line. Certain tracts are ceded to the United States, some of which border on waters of the state. With enumerated exceptions, jurisdiction of counties separated by or bordering on public waters is concurrent over such waters. (Smith-Forida)

6F. Nonstructural Alternatives

CAN ECOLOGY PROVIDE THE BASIS FOR SYNTHESIS,
Wisconsin Univ., Madison. Lab. of Limnology.
Arthur Hasler.
Social Sciences and the Environment, Colorado University Press, 1967. p 42-45.

Descriptors: *Ecology, *Environment, *Synthesis, *Environmental effects, Eutrophication, Limnology, Reservoirs, Water pollution effects, Planning, Water pollution control.
Identifiers: Social science, Physical science, Resource management, Evolution, Water resources management, Weather modification, Species extinction, Blue whale, Religious influence, Italy, Madison (Wis), Lake Washington (Wash), Lake Tahoe (Calif-Nev), Lake Zurich (Switz), Lake Baikal (USSR), Lake Wingra (Wis), Lake Mendota (Wis), Lake Monona (Wis), Lake Kegonsa (Wis), Lake Waubesa (Wis).

Throughout history man has modified his environment. Today he faces the price of some of these modifications; extinction of animal species (blue whale and others), deterioration of water quality, flood damage resulting from poor agricultural practices, to mention only a few. More research is needed to solve some of the national and international problems regarding man-made environments, but in many aspects sufficient technology is available to reverse such effects if we had the economic capacity and laws to initiate action. Author feels that, where scientists and mass communications media are lacking, there exists a role for the church, through personal contact, in influencing people to re-evaluate adverse effects of outdated techniques of land management. There is a great lack of communication between scientific disciplines which could prevent future mistakes by presenting viable alternatives to present techniques. Although man-induced changes in the environment will necessarily occur, ecologists have knowledge and techniques which can be used to diminish destructive and deteriorative processes, can suggest alternatives and can work cooperatively with other scientists to find better solutions. (Ketelle-Wisconsin)

ZONING.

Va Code Ann secs 15.1-486, 15.1-489, 15.1-490 (1964), as amended, (Supp 1968).

Descriptors: *Virginia, *Zoning, *Resource development, *Local governments, Water policy, Water resources development, Water resources, Administration, Cities, Conservation, Flood plain zoning, Governments, Natural resources, Planning, Resources, Water conservation, Flood plains, Flood protection, Flood control, Land use, Sewage, Regulation, Legislation.

The governing body of any county or municipality may divide its territory into districts, and each district may regulate, restrict, permit, prohibit, and determine the following: (1) the use of land, buildings, structures, and other premises for

agricultural, commercial, industrial, residential, flood plain, and other purposes; (2) the size, location, construction, or removal of structures; (3) the areas and dimensions of land, water, and air space to be occupied by structures and uses, and of open spaces to be left unoccupied, based on whether a public or community water supply or sewer system is available and used; and (4) the excavation of natural resources. Zoning ordinances shall be for the general purpose of promoting the public health, safety, or general welfare. To these ends such ordinances shall provide adequate safety from fire, flood, and other dangers, and shall expedite the provision of adequate water, sewage, flood protection, and other public requirements. Such districts shall be drawn with reasonable consideration for the conservation of natural resources, and preservation of flood plains. (Smith-Florida)

6G. Ecologic Impact of Water Development

INTERTIDAL SALT MARSHES.
R I Gen Laws Ann secs 11-46.1-1 (Supp 1967).

Descriptors: *Rhode Island, *Fishing, *Tidal marshes, *Balance of nature, Legislation, Legal aspects, Marshes, Coastal marshes, Salt marshes, Intertidal areas, Fish, Fish conservation, Shellfish, Nitrates, Phosphates, Plankton, Organic compounds, Permits, Natural resources, Regulation, Marsh plants, Administrative agencies, Ecology, Excavation, Water pollution, Pollution abatement.
Identifiers: *Intertidal salt marshes, Penalties (Criminal).

The state constitution guarantees the right to fish. This right cannot be enjoyed unless fish and shellfish can be found in abundance. The metabolism and katabolism of plants and animals found in salt marshes furnishes the nitrates, phosphates, sugars, plankton, and organic chemicals necessary for the nuture of fish and shellfish. The salt marshes of the state are in jeopardy of despoliation. To remedy the foregoing state of affairs it is resolved that any person who dumps or deposits mud, dirt, or rubbish on, or who excavates and disturbes the ecology of intertidal salt marshes without first obtaining a permit from the department of natural resources will be fined. For the purposes of this chapter, an intertidal salt marsh is described in terms of enumerated plants which grow thereon. The director of natural resources will refuse to issue a permit if in his judgement the end result would be the disruption of the ecology of a salt marsh. (Keith-Florida)

7A. Network Design

THE DEFINITION OF THE TERMS HYDROLOGICALLY ARID AND HUMID FOR AUSTRALIA,
Queensland Univ., Brisbane (Australia). Dept. of Civil Engineering.
J. R. Watkins.
J Hydrol, Vol 9, No 2, p 167-181, Oct 1969. 15 p, 9 fig, 5 tab, 7 ref.

Descriptors: *Rainfall-runoff relationships, *Arid lands, *Classification, *Climatic zones, Precipitation (Atmospheric), Runoff, Water yield, Temperature, Hydrology, Groundwater, Geomorphology, Evaporation.
Identifiers: *Australia, Aridity classification.

The importance of using runoff data as a measure of aridity is emphasized. If aridity is defined in terms of annual runoff, a direct relationship will then exist between the behavior of surface storages, groundwater hydrology and geomorphic landform process. Stream gage data and simple methods of estimation from either precipitation and evaporation or precipitation and temperature data are discussed for Australian stations. A classification into four main zones of varying hydrologic aridity is proposed. (Knapp-USGS)

DRAINAGE NETWORK ANALYSIS WITH K-BAND RADAR IMAGERY,
Kentucky Univ., Lexington. Dept. of Geography.
Roger M. McCoy.
Geogr Rev, Vol 59, No 4, p 493-512, Oct 1969. 20 p, 11 fig, 3 tab, 10 ref. NASA Contract No 17-0004-003 and NASA Grant NsG-298.

Descriptors: *Drainage, *Drainage systems, *Radar, *Surface drainage, Mapping, Aerial photography, Clouds, Rain, Watersheds (Basins), Hydrologic data, Geomorphology, Instrumentation, River basins, Slopes, Stations, Mathematical studies, Topography, Lakes.
Identifiers: *K-band radar imagery, Drainage network.

The author describes in detail the use of radar techniques for drainage network analysis. Radar-image and map presentation comparison and the evaluation of the capabilities of the radar-imagery methods are also given. Radar imagery is especially suitable for reconnaissance studies of landforms where large coverage and great detail relative to image scale is desired. For example, a K-band image of terrain 10 mi wide has a scale of 1:200,000, but the drainage data available from the image is equal to that from a 1:62,500 topographic map. (Gabriel-USGS)

7B. Data Acquisition

THE CALCULATION OF NON-PARALLELISM OF GAMMA ACCESS TUBES, USING SOIL SAMPLING DATA,
Institute for Land and Water Management Research, Wageningen (Netherlands).
P. E. Rijtema.
J Hydrol, Vol 9, No 2, p 206-212, Oct 1969. 7 p, 3 tab, 1 ref.

Descriptors: *Nuclear moisture meters, *Gamma rays, *Calibrations, Soil moisture meters, Instrumentation, Density, Soil moisture, Soil water.
Identifiers: Gamma-ray moisture meters, Access tubes.

An equation has been derived to determine the errors due to non-parallelism of gamma access tubes with the aid of soil sampling data, taken from the direct environment of the measuring spot. It is shown that the determination of the change in moisture content is not very sensitive to errors due to non-parallelism. When the absolute values of moisture content are needed, it is always necessary to determine the errors due to non-parallelism of the access tubes. (Knapp-USGS)

SOIL MOISTURE MEASUREMENT BY THE GAMMA TRANSMISSION METHOD,
Institute for Land and Water Management Research, Wageningen (Netherlands).
A. H. Ryhiner, and J. Pankow.
J Hydrol, Vol 9, No 2, p 194-205, Oct 1969. 12 p, 8 fig, 2 tab, 3 ref.

Descriptors: *Nuclear moisture meters, *Gamma rays, *Calibrations, Soil moisture meters, Instrumentation, Density, Soil moisture, Soil water.
Identifiers: Gamma-transmission soil moisture meters.

A discussion is given of the use of the gamma transmission method for the measurement of soil moisture variations. It is shown that a single calibration curve can be used for very different soils. An approach is presented for the determination of the build-up factor of scattered radiation and for the instrumental resolution time. It appeared possible to calculate the systematic errors due to non-parallelism of the access tubes. (Knapp-USGS)

SEEPAGE DETECTION BY REMOTE SENSING,
HRB Singer, Inc., State College, Pa. Radiometric Lab.
Thomas R. Ory.
Proc 2nd Seepage Symp, Phoenix, Ariz, Mar 25-27, 1968, Agr Res Serv Rep 41-147, p 128-133, 1969. 6 p, 4 fig, 2 tab.

Descriptors: *Seepage, *Canal seepage, *Remote sensing, Radar, Infrared radiation, Aerial photography, Water temperature, Evaporation, Solar radiation.
Identifiers: Seepage detection.

A number of remote sensing techniques have been shown to have application in the detection and evaluation of seepage. Radar and infrared sensors are presently available for use in seepage detection research and, to a limited extent, for operational work. When these sensors are used after a careful analysis of the detection problem, and with utilization of the information available from conventional techniques, the success probability of remote seepage detection should be very good. Future research will undoubtedly yield less expensive and more reliable remote sensors for this application as the payoffs from initial employment begin to stimulate their use. (Knapp-USGS)

OCEANOGRAPHIC PROFILING WITH IMPROVED VERTICAL RESOLUTION,
Hawaii Inst. of Geophysics, Honolulu.
Volker Graefe, and Brent Gallagher.
J Geophys Res, Vol 74, No 23, p 5425-5431, Oct 20, 1969. 7 p, 4 fig, 5 ref.

Descriptors: *Oceanography, *Profiles, *Instrumentation, Ships, Isotherms, Electronic equipment, Salinity, Water temperature, Hydrographs, Water properties.
Identifiers: Oceanographic profiling.

Two techniques have been developed for obtaining high-resolution vertical profiles of oceanographic variables. The methods increase the spatial resolution of lowered sensors by removing the influence of vertical ship motions. Both telemetry and retrieval are accomplished easily. Used with the STD recorder, the methods allow the resolution of features whose vertical extent is a few decimeters. This permits smaller, laterally homogeneous layers to be distinguished and contrasted with morphological features intersecting isopycnal and isothermal surfaces and will make possible more comprehensive surveys of physical microstructure. ORCENT - A DIGITAL COMPUTER PROGRAM FOR SATURATED AND LOW SUPERHEAT STEAM TURBINE CYCLE ANALYSIS,
Oak Ridge National Lab., Tenn.
H. I. Bowers.
Report ORNL-2395, Jan 1969. 89 p, 6 fig.
Identifiers: *Programs (Computers), *Steam cycle, *Turbines, AEC sponsored, Coupling (Reactor-desalting plant), Dual-purpose plant, Feedwater heating, Flowsheets, Heat balance, Nuclear desalination, Single-purpose plant, Turbine-generators.

The program will perform full-load, design point calculations for steam turbine cycles supplied with throttle steam characteristic of contemporary water reactor power plants and will handle both condensing and back-pressure turbine exhaust arrangements. Turbine performance calculations are based on the General Electric Company method for large steam turbine-generators operating with saturated and low superheat throttle steam. Output includes all information normally shown on a turbine cycle heat balance diagram. The program is written in FORTRAN IV for the IBM 360/75 computer at Oak Ridge National Laboratory.

COST STUDY OF PRODUCT WATER CONVEYANCE AND ELECTRIC POWER TRANSMISSION FOR LARGE NUCLEAR DUAL-PURPOSE PLANTS.
Parsons Ralph M. Co., Los Angeles, Calif.

Report prepared for ORNL Under Subcontract 2863, Aug 1967. 130 p, 43 fig.
Identifiers: *Canals, *Pipelines, *Power transmission costs, *Water conveyance, *Water conveyance costs, Capitalized costs, Construction costs, Dual-purpose plant economics, Economic evaluations, Fixed charge rate, Offshore island sitting, Operating costs, Parametric studies, Power transmission systems, Right-of-way acquisition, Seawater intake and discharge systems, Site selection criteria.

Graphs are given for the costs for conveying product water from a plant to a delivery point from 0 to 100 miles away as a function of the important variables that determine these costs. Water lifts of 0 to 1500 ft and flows of 100 to 1000 mgd are considered. Similar curves are given for seawater intake and discharge lines. A general commentary covers open canals, pressure and nonpressure pipes, tunnels, land requirements, site locations

and intake and discharge systems. The cost of electric power transmission from the plant to a load center is given graphically for 250- to 2500-mw plants for distances of 0 to 100 miles.

ON THE PENETRATION OF A TURBULENT LAYER INTO STRATIFIED FLUID,
Johns Hopkins Univ., Baltimore, Md. Dept. of Mechanics.
H. Kato, and O. M. Phillips.
Journal of Fluid Mechanics, Vol 37, Part 4, p 643-655, (1969). 9 ref, 6 fig.

Descriptors: *Stratification, *Turbulence, Model studies, Winds.
Identifiers: Entrainment.

The aim of this study was to explore the possibility of generating a turbulent layer not by direct stirring but by the application of a known horizontal stress at the upper ('free') surface of a stratified fluid and to make preliminary measurements of the rate at which the layer penetrates into the underlying fluid. The model was an annular tank at the surface of which a constant stress could be applied in the circumferential direction. The development of the turbulent layer by entrainment of the underlying fluid is described and it is found that the entrainment coefficient E, the ratio of the entrainment velocity u sub e to the friction velocity u sub * is given in terms of the depth D of the mixed layer and the density jump delta (rho) across the entrainment interface by the relation: E= (u sub e)/ (u sub*)= 2.5 (rho sub o) (u sq sub*)/g (delta) (rho)D. The form of these results is consistent with those found by Turner with an agitation tank, but the parameters used here allow direct application to entrainment in the ocean. (Guerrero-Vanderbilt)

JET DIFFUSION IN THE REGION OF FLOW ESTABLISHMENT,
Iowa Univ., Iowa City. Inst. of Hydraulic Research.
Sedat Sami, Thomas Carmody, and Hunter Rouse.
Journal of Fluid Mechanics, Vol 27, Part 2, p 231-252, 1967. 24 fig, 21 ref.

Descriptors: *Jets, *Diffusion, *Turbulence, *Flow, Nozzles, Turbulent flow, Flow measurement, Flow profiles.
Identifiers: Mean flow equation.

The purpose of this study was to study the mean flow and the turbulence characteristics of a diffusing jet through the measurements of all the terms of the mean energy equation for the diffusing jet. A nozzle diameter of 1.0 ft. with an efflux velocity of about 35 ft/sec was used to determine the flow characteristics. Four types of probes were used: a static tube for mean ambient pressure; a single wire anemometer probe, for the axial components of the mean velocity and of the fluctuation, the autocorrelation, the dissipation length, and the intermittency factor; a cross wire anemometer probe, for both the axial and radial components of the mean velocity, the three (axial, radial, and tangential) components of the fluctuation, and the turbulent shear; and a piezo-electric ceramic probe was developed for the measurement of the pressure fluctuation. Also in the measurements was included the temporal mean gradient. Hot wire and pressure-probe transverses were carried out at sections with x/D ratios from 1 to 20. Conclusions were: (a) The fluctuating-pressure and turbulence-intensity fields were observed to be closely similar in form, (b) A detailed evaluation of all the terms of the momentum and mean-energy equations for the region of flow establishment, in both integral and differential forms, indicates that a satisfactory representation of the mean flow is now at hand. (Guerrero-Vanderbilt)
W70-01387

AN EXPERIMENTAL STUDY OF TURBULENCE IN A DENSITY-STRATIFIED SHEAR FLOW,
Manchester Univ. (England). Dept. of the Mechanics of Fluids.
C. A. G. Webster.
Journal of Fluid Mechanics, Vol 19, p 221-245, (1964). 19 ref, 24 fig, 4 tabl.

Descriptors: *Density stratification, *Turbulence, *Winds, *Flow measurement, Conductivity, Viscosity, Shear, Wind velocity.
Identifiers: *Richardson number.

The purpose of this study was the investigation of turbulence in the density stratified shear flow of a specially designed wind tunnel in which the density gradient is created by differential heating of the air. The heated shear-flow wind tunnel is a small tunnel, nominally 0.5 m. square in section in which essentially linear temperature and velocity gradients extend over an appreciable depth of the flow. Mean temperature and temperature gradients were measured using thermometers and thermocouples, and a method of measuring low wind speeds based on the periodic shedding of vortices by a circular cylinder was discussed and used. Also, a hot-wire anemometer was used. The characteristics measured were the stream-wise and vertical components of the turbulence together with the temperature fluctuation at the same point. Conclusions were: (a) The experiments have produced much new information concerning the variation with stability of the various quantities associated with turbulence and turbulent transport processes, and at the same time indicating the possibility of a detailed study of these flows. (b) It was not possible to attain steady state conditions. The indications were that a doubling, or even a trebling, of the linear dimensions of the apparatus would be necessary to do so. (c) The results obtained serve to confirm that the ratio (Eddy conductivity/Eddy viscosity) falls with increasing Richardson number. (Guerrero-Vanderbilt)
W70-01389

TURBULENT BUOYANT CONVECTION FROM A SOURCE IN A CONFINED REGION,
Cambridge Univ. (England). Dept. of Applied Mathematics.
W. D. Baines, and J. S. Turner.
Journal of Fluid Mechanics, Vol 37, Part 1, p 51-80, (1969). 13 ref, 11 fig.

Descriptors: *Buoyance, *Turbulence, Convection.
Identifiers: Entrainment.

This paper considers the effect of continuous convection from small sources of buoyancy on the properties of the environment when the region of interest is bounded. The main assumptions are that the entrainment into the turbulent buoyant region is at a rate proportional to the local mean upward velocity, and that the buoyant elements spread out at the top of the region and become part of the non-turbulent environment at that level. A time-dependent solution is sought which takes into account the possible modification of the environment by the buoyant elements with subsequent effects on the plume. Asymptotic solutions, valid at large times, are obtained from the cases of plumes from point and line sources and also periodically released thermals. The analysis is carried out in detail for the point source in an environment of constant cross-section. Laboratory experiments have beem conducted for this case, and these verify the major predictions of the theory. It is then shown how the method can be extended to include more realistic starting conditions for the convection, and a general shape of bounded environment. Finally, the model is applied quantitatively to a variety of problems in engineering, the atmosphere and the ocean, and the limitations on its use are discussed. (Guerrero-Vanderbilt)

EVALUATION OF ALL POTENTIAL SOURCES OF ENERGY FOR DESALTING,
Ebasco Services, Inc., New York.
F. L. C. Reichle.
Proc Intern Symp Water Desalination, 1st, 1965, Washington 1, 604-19, (1967). 9 fig. Paper No SWD/121.
Identifiers: *Dual-purpose plant economics, *Economic evaluations, *Energy sources, *Nuclear desalination, Base-load, Distillation processes, Fossil fuels, Freeze processes, Nuclear energy sources, Osmosis, Peaking power.

Minor sources of energy (solar, geothermal, waste heat, and hydro) may serve best in a few special situations where fresh water demand is small and the source of energy available near the point of need. Major sources of energy (gas, oil, coal, and nuclear) may be optimum, depending on the process used and the salinity of water to be converted. The lowest cost steam or electric energy for desalting can usually be obtained by integrating the energy requirements with an established electric utility system. There is potential for future development in use of off-peak electric power for desalting brackish water by electrodialysis or for such processes as reverse osmosis, freezing, and vapor compression which require relatively small amounts of mechanical energy for desalting either brackish or seawater compared to the large amounts of thermal energy required for distribution processes.
W70-01522

GAS TURBINES PROVE EFFECTIVE FOR DESALINATION,
Stal-Laval Turbine Co., Finspang, Sweden.
N. O. Lier.
Power 112 (11), 79-81 (1968). 7 fig.
Identifiers: *Gas turbines, Energy sources, Multistage flash distillation, Vapor compression evaporation, Vertical tube evaporators, Water costs estimate.

A brief comment on the possible use of a 50-MW industrial gas turbine generator as a prime mover and MSF heat source. Normal performance of such a turbine is 47.8-MW output and 193-MBTU/HR available heat in the exhaust gas at 265 deg F. Available heat in the intercooler is 135 MBTU/HR. With this heat, the gas turbine plus straight MSF will give 41.5 MW of saleable power and 7.0 MGD of fresh water. By adding a vapor compressor and two vertical tube evaporators, the system can produce 20.0 MW of saleable power and 19.0 MGD of water. Various combinations of these are possible to provide a wide range of water/power ratios. Assuming 25 cents/MBTU fossil fuel and 6 MIL/KWH sale of power, a gas turbine and MSF plant could produce water for 26 cents/1000 gal, while water from a steam turbine with MSF would result in 41.5 cents/1000 gal water. If we assume 3.5 cents/MBTU fuel and 6 MIL power, the gas turbine with MSF results in a profit of 19.5 cents/1000 gal (a cost of -19.5) and the steam turbine and MSF would have a profit of 1.5 cents/1000 gal. A 400-MW (saleable) nuclear plant producing 72 MGD (selling 6 mil power) would have a water cost of 34.5 cents/1000 gal.
W70-01523

FRESH WATER FROM NUCLEAR POWER WITH THE AGR AND SGHWR,
United Kingdom Atomic Energy Authority, Risley (England).
G. R. Bainbridge.
Presented at IAEA Regional Survey Course on Problems and Prospects of Nuclear Power Applications in Developing Countries, Santiago, Chile, Dec 4-7, 1967. 13 p, 11 fig. Report No TRG 1691 (R).
Identifiers: *Dual-purpose plant, *Nuclear energy sources, Energy sources, Parametric studies, Water costs estimate, 0-500 MW (E) reactors, 500 plus MW (E) reactors, 51-250 MGD plant.

Typical parameters were developed for two dual-purpose systems with a gas-cooled reactor, the AGR, or a steam generating heavy water moderated (and light water cooled) reactor, the SGHWR. The AGR parametric design is for 400 MWE net electrical output and 67.5 MGD of fresh water, while the SGHWR design is for 20C MWE and 94.5 MGD. There is scope for varying the proportions of electricity and water products to suit the market. The AGR design is capable of 42% station efficiency if used mainly as an electricity producer. Because of this (the UK has adequate natural water resources at present), it is being built in large reactor-turbine unit sizes of 625 MWE at Dungeness, Hinkley Point, and Hunterston B stations with two reactor-turbine units at each site. Other similar units are planned to provide at least 3000 MWE of AGRS in a total nuclear capacity of 13,000 MWE of gas-cooled reactor stations by 1975. The SGHWR design would give a station efficiency around 33% as an electricity producer. An SGHWR power station in final stages of development (Dec. 1967) at Winfrith Heath will make possible production of either 400 MWE or 200 MWE plus 94.5 MGD of fresh water. Conclusions are that for extrapolating to very large outputs (exceeding 1200 MWE) the AGR is most suitable, while the SGHWR is best for plants below 400 MWE.
W70-01525

A FUEL CYCLE ECONOMIC ANALYSIS OF OXIDE FUELED POWER AND PROCESS HEAT PWR FOR SEAWATER DESALINATION,
Oak Ridge National Lab., Tenn.
E. P. Rahe, Jr., J. E. Jones, Jr., and T. T. Robin.
Report ORNL-TM-2046, Jan 1969. 59 p, 7 fig, 20 tab, 17 ref.
Identifiers: *Economic evaluations, *Nuclear fuel cycle costs, AEC sponsored, Fuel costs, Municipal financing, Nuclear fuel processing studies, Pressurized-water reactors, Private financing, Process heat, Thermal-hydraulic design, 3000 plus MW (T) reactors.

Economic studies were conducted to determine minimum equilibrium fuel cycle costs for two oxide fueled PWR concepts. Each reactor is to be used to generate steam for a single-purpose desalination plant. The two reactor concepts studied were a commercial product line power reactor and a lower temperature process heat reactor. Fuel cycle costs were based on economic ground rules believed to be representative for reactors going on-line in 1980-90. The study indicated that, for a publicly owned reactor utilizing a privately owned 75,000 MWT capacity fabrication plant, equilibrium fuel cycle costs of 0.348 MILLS/KWHR (T) and 0.324 MILLS/KWHR (T) could be expected from commercial power and process heat reactors, respectively. These costs are based on an ore cost of $8.00/lb U308, a separative work charge of $26/KG U and a tails of 0.20 Wt.% U-235. For a privately owned reactor using the same fabrication-reprocessing complex, corresponding fuel cycle costs are .385 and .367 MILLS/KWHR (T). If the reactor is publicly owned and the complex is publicly owned with a 15,000 MWTH industry capacity, equilibrium fuel cycle costs are 0.402 and 0.381 MILLS/KWHR (T), respectively.
W70-01527

THE UNCLAD-METAL BREEDER REACTOR (UMBR) FOR DESALTING OR POWER,
Oak Ridge National Lab., Tenn.
R. P. Hammond, C. C. Burwell, R. S. Carlsmith, J. G. Delene, and L. C. Fuller.
Report ORNL-4202, Jan 1969. 141 p, 32 fig, 63 ref.
Identifiers: *Economic evaluations, *Feasibility study, *Liquid-metal fast-breeder reactors, AEC sponsored, Breeder reactors, Energy costs, Energy sources, Nuclear design, Nuclear energy sources, Reactor design, 3000 plus MW (T) reactors.

The findings of preliminary investigations of sodium-cooled fast breeder reactors fueled with unclad metal to investigate the possibilities of producing low-cost low-temperature heat suitable for seawater distillation. Fuel materials considered are thorium-based thorium-uranium binary alloys, thorium-based thorium-uranium-plutonium ternary alloys, and uranium-based alloys. Together with the two unclad-metal blanket materials thorium and uranium - used singly or jointly, a number of reactor core combinations is possible. Use of unclad metals as core and blanket materials appears to be technically feasible, based on the incomplete available data. Good breeding gains and doubling times were calculated for all systems considered because of the absence of cladding and other diluents. The characteristics of two reactors fueled with the thorium-based thorium-uranium-plutonium ternary alloy combined with uranium blanket material are presented and the less desirable low-temperature all-uranium-based fuel system and the nearer term high-temperature all-thorium based fuel system are discussed briefly. The reactors considered are one designed primarily for low-temperature.

CONSIDERATIONS AFFECTING STEAM POWER PLANT SITE SELECTION.
Office of Science and Technology, Washington, D.C.

Report, Dec 1968. 133 p, 110 ref.
Identifiers: *Energy sources, *Power growth surveys, *Site selection criteria, Air pollution, Dual-purpose plant, Exclusion zones, Fossil fuels, Multipurpose plant, Nuclear energy sources, Power requirements, Power transmission systems, Reactor siting, Reviews, Site preparations, Siting surveys.

The purpose of this report is to make available a factual presentation of the public interest considerations affecting generating site selection based on existing information. Many of the siting issues which are only now emerging are apt to become of crucial significance in the future. The report identifies such issues as the prospects and problems of metropolitan siting, undergrounding transmission lines, the need to protect scenic areas and the quality of our air and water and yet meet the nations need for reliable, low-cost power supply. It is clear that a greater effort in research and development and coordinated planning among all concerned interests is needed to achieve optimum solutions. The basic question which the report raises, but does not purport to answer, is what additional planning mechanisms or other actions are needed to identify and utilize in the public interest those prime sites which are best adapted to meeting the conflicting demands of environmental quality control, safety, and reliable economical electric power supply. Both fossil fuels and nuclear energy sources are considered. Dual-purpose as well as power-only plants are covered.

8F. Concrete

THE DURABILITY OF CEMENT AND CONCRETE IN SEA WATER,
Standards Institution of Israel, Tel Aviv.
M. Ben-Yair.
Desalination 3, 147-54, 1967, 5 fig, 11 ref. Presented at 2nd European Symp Fresh Water from Sea, Vol 4, Athens, May 1967.
Identifiers: *Concrete construction, *Concretes, *Construction joints (Concrete), Adhesives, Coatings, Fabrication materials, Protective coatings.

Described are results of basic and applied studies performed to clarify the mechanism of sulphate, chloride and magnesium attack on concrete, separately and together, as they occur in seawater, and methods of prevention. Resulting practical precautions suggested for construction of concrete buildings in seawater include (1) a dense and impermeable concrete must be produced under superior control conditions and used without joints or cracks, (2) the most suitable brand of cement and admixture must be selected in each case, e.g., Portland cement A.S.T.M. type I or V, trass, air entrainers, etc., and (3) external protective coatings must be used.

RATES OF REACTION OF DISSOLVED OXYGEN WITH SCAVENGERS IN SWEET AND SOUR BRINES,
Mobil Research and Development Corp., Dallas, Tex.
E. S. Snavely, and F. E. Blount.
Corrosion, Vol 25, No 10, p 397-404, Oct 1969. 8 p, 15 fig, 2 tab, 6 ref.

Descriptors: *Dissolved oxygen, *Corrosion, *Oxidation, *Corrosion control, Chemical reactions, Catalysts, Chemcontrol, Sodium sulfate, Hydrogen sulfide, Sulfides.
Identifiers: *Oxygen scavenging, Oxygen scavengers.

Rates of reaction of dissolved oxygen with hydrogen sulfide were measured in a laboratory apparatus using a polarographic-type instrument for the measurement of oxygen concentrations. Results show that oxidation occurs only at high pH in the absence of catalytic species. The reaction is catalyzed by transition metal ions in the order Ni, Co, Mn, Cu, Fe. In all cases, the reaction rate increases with pH and is at first complex but becomes zero-order with respect to oxygen after a brief introduction period. Some natural waters contain sufficient catalysts that additional amounts are not required for scavenging oxygen with sulfur dioxide or sodium sulfite. Sour waters cannot be scavenged with sulfur dioxide or sodium sulfite because of ineffectiveness of catalysts. (Knapp-USGS)
W70-01435

PITTING OF TITANIUM ALLOYS IN SALINE WATERS,
Oak Ridge National Lab., Tenn.
F. A. Posey, and G. G. Bohlmann.

Desalination 3, 269-79, 1967, 10 fig, 40 ref. Presented at 2nd European Symp Fresh Water from Sea, Vol 4, Athens, May 1967.
Identifiers: *Corrosion, *Corrosion tests, *Titanium, Corrosion problems, Evaporated-condenser tubes, Evaporators, Fabrication materials, OSW sponsored, Pitting (Corrosion).

Electrochemical aspects of the corrosion of titanium and a number of its alloys were studied in flowing, high-temperature salt solutions at temperatures up to 220 deg F in a titanium loop facility. Measured polarization curves show that a pitting potential exists at sufficiently high potentials for all the alloys. Increase of temperature greatly affects the temperature are reproducible and quite characteristic of each grade of titanium alloy and show clearly which alloys are superior in tendency towards pitting attack. The results suggest an upper temperature limit of usefulness for many titanium alloys without risk of severe localized attack. Alloys of titanium which contain molybdenum show promise for application in high-temperature saline waters.

RESEARCH ON CORROSION MECHANISMS IN SALINE WATER, USING REVERSIBLE AND IRREVERSIBLE ELECTRODES,
Battelle Memorial Inst., Columbus, Ohio.
P. D. Miller, A. B. Tripler, J. J. Ward, F. H. Hanie, and W. K. Boyd.
OSW R and D Progr Rept No 174, Apr 1966. 105 p, 22 fig, 31 tab, 48 ref.
Identifiers: *Corrosion mechanisms, *Thermogalvanic corrosion, Corrosion tests, Electrochemical corrosion, Fabrication materials.

Describes studies on corrosion mechanisms of metals in salt solutions using theoretical and experimental approaches. Investigations included research on corrosion cells driven by thermogalvanic potentials, use of irreversible thermodynamics to construct reaction models to fit experimental data, and use of potentiostatic and polarization techniques to follow electrode reactions. Different configurations of thermogalvanic cells were operated at temperatures ranging to 100 deg C. Sulfate and chloride solutions containing ions with which the electrodes were reversible were studied. Electrodes were made from pure aluminum, copper, iron, nickel, silver, titanium, and zinc. Irreversible thermodynamics helped explain the action of copper, nickel, and zinc thermal cells in sulfate electrolytes containing ions reversible to the electrodes. Calculations aided in predicting temperature coefficients for copper and nickel cells. The zinc system could not be explained completely. Thermogalvanic-cell corrosion was important under numerous conditions. Significantly, dissolved oxygen was not required necessarily for thermogalvanic corrosion to occur. A continuing effort would be necessary to apply these procedures to chloride systems and seawater. Results indicated progress is possible by coupling approaches from polarization studies with those from thermodynamic models and thermogalvanic cells.

MARINE RESEARCH, FISCAL YEAR 1968,
Smithsonian Institution, Washington, D.C. Science Information Exchange.
Monroe E. Freeman.
Nat Counc on Marine Resources and Eng Develop, Executive Office of the President, July 1969. 740 p, 2589 ref, 4 index.

Descriptors: *Bibliographies, *Reviews, *Oceans, *Research facilities, *Projects, Grants, Research equipment, Resource development, Water resources development, Laboratories, Governments, Institutions.
Identifiers: *Marine Research Catalog, Marine resources.

Marine Research--Fiscal Year 1968 is the product of an inventory of Federal and non-Federal organizations with ocean-related research programs and interests. It contains descriptive summaries of 2,589 unclassified projects which were funded, either for the first time or as continuing efforts, during that fiscal year. Associated with these projects, and identified by name and address, are 3,022 investigators; 457 contractors; 25 Federal supporting agencies; and 95 non-Federal sources of support. The projects referenced in the catalog cover basic and applied research on the marine environment and its resources. This environment is defined to comprise the oceans, the estuarine and coastal areas, and the Great Lakes. For purposes of project selection, contributors were requested to interpret the guideline definitions in a broad sense so that pertinent items would be overlooked. In addition to the summaries of the 2,589 projects, the catalog contains the following indexes: Subject Index, Investigator Index, Contractor Index, and Supporting Agency Index. Each project has been indexed to an average of five terms which are arranged in hierarchies indicating relationships between broader and narrower concepts. The index term is followed by the project title, additional keywords used in indexing, and the chapter and subchapter number of the project. (Knapp-USGS)

INDEXED BIBLIOGRAPHY OF NUCLEAR DESALINATION LITERATURE - 3,
AEC, Oak Ridge National Lab., Tenn.
K. O. Johnson.
National Desalination Information Center, Report ORNL-NDIC-5, UC-80-Reactor Technology, May 1969. 63 p, 200 ref.

Descriptors: *Bibliographies, *Abstracts, *Desalination, Documentation, Distillation, Desalination processes, Desalination plants, Saline water systems.

Abstracts are given for approximately 200 published articles related to the desalination of seawater. The body of the report is a copy of information stored in a computerized storage and retrieval system for the Nuclear Desalination Information Center (NDIC) at the Oak Ridge National Laboratory. The abstracts are grouped in nine categories (and repeated if they fall into more than one category). An author and a keyword index to the articles referenced is provided. The keywords, which identify the content of the articles, were chosen from a thesaurus developed by NDIC.

AT URBANA-CHAMPAIGN

VOLUME 3, NUMBER 5
MARCH 1, 1970

W70-01642 -- W70-02042

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 3, NUMBER 5
MARCH 1, 1970

W70-01642 -- W70-02042

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

DRAINAGE DESIGN THEORY AND PRACTICE,
Ministry of Agriculture, Fisheries and Food, Cambridge (England). Field Drainage Experiment Unit.
E. U. Nwa, and J. G. Twocock.
J Hydrol, Vol 9, No 3, p 259-276, Nov 1969. 18 p, 10 fig, 2 tab, 15 ref.

Descriptors: *Drainage systems, *Soil water movement, *Groundwater movement, *Drainage engineering, Water management (Applied), Drainage practices, Evaluation, Design, On-site investigations, Mathematical studies, Model studies, Ditches, Drainage Programs, Agricultural engineering.
Identifiers: Drainage design theory.

Several drainage equations were chosen to compare them with the performance of an existing drainage scheme. A review of the drainage theories chosen is reported. The auger-hole method was used to determine the average hydraulic conductivity used in the calculation, and the variable drainable porosity was determined using Taylor's method. The drain discharge and the shape of the water table were determined by means of a flowmeter, and lines of piezometers, respectively. Two rainfree periods were selected for the experiment. The water table profile tends to indicate an essentially flat water surface. All the equations tested, except Luthin's, gave an average calculated spacing which is larger than the actual spacing. It is concluded that the site could perform as well as it is doing now with a wider spacing. More research is recommended before one or two equations could be chosen to aid the design of drainage schemes. (Knapp-USGS)

BLUEPRINT FOR A PHYSICALLY-BASED, DIGITALLY-SIMULATED HYDROLOGIC RESPONSE MODEL,
Department of Energy, Mines and Resources, Calgary (Alberta). Inland Waters Branch; and Department of Fisheries and Forestry, Calgary (Alberta). Forestry Branch.
R. Allan Freeze, and R. L. Harlan.
J Hydrol, Vol 9, No. 3, p 237-258, Nov 1969. 22 p, 6 fig, 33 ref.

Descriptors: *Mathematical models, *Streamflow, *Groundwater movement, *Soil water movements, *Reviews, Rainfall-runoff relationships, Hydrology, Hydrogeology, Surface-groundwater relationships, Simulation analysis, Parametric hydrology, Synthetic hydrology, Model studies, Saturated flow, Unsaturated flow.
Identifiers: Hydrologic model studies.

Recent developments in hydrologic model studies, simulation analysis, computer models, and mathematical descriptions of flow systems are reviewed. Meaningful results are now available in the form of numerical solutions to mathematical boundary value problems for groundwater flow, unsaturated porous media flow, overland flow, and channel flow. These developments in physical hydrology, together with the tremendous advance in digital computer technology, should provide the impetus for a necessary redirection of research in hydrologic simulation. A blueprint for the development of physically-based hydrologic response models is presented; the level of sophistication that can be achieved with presently available methodology is discussed; and areas for necessary future research are pinpointed. 2B. Precipitation

RAINFALL PATTERNS ON THE KAWEKA RANGE,
Ministry of Works, Napier (New Zealand). Water and Soil Div.
P. J. Grant.
J Hydrol (New Zeal), Vol 8, No 1, p 17-34, 1969. 18 p, 8 fig, 7 tab, 17 ref, 1 append.

Descriptors: *Rainfall disposition, *Topography, *Distribution patterns, Rainfall, Statistical methods, Sampling, Rain gages, Rainfall-runoff relationships, Data collections.
Identifiers: *New Zealand, Kaweka Range (New Zeal).

Rainfall patterns are based on records from 17 storage rain gages in the rangeland area, and from daily rain-gage stations surrounding the Kaweka Range, New Zealand. Correlations between storage and daily reference stations, using rainfall amounts for corresponding periods, determined the affinities of the storage stations and indicated that three distinct directional influences exist. In relation to the Kaweka Range these are recognized as the N, SW, and SE regimes or sectors. Annual rainfalls attain about 150 in. in the highest part of the range. For a given altitude rainfall totals are lower in the northern area than on the southern Kaweka Range. The SW sector is the least variable--about 10%. The seasonal and monthly patterns of rainfall are presented as percentages of annual norms, and it is shown how approximate seasonal or monthly values may be derived for any rangeland area. RAINFALL PATTERNS IN THE CENTRAL NEGEV DESERT,
National and Univ. Inst. of Agriculture, Rehovoth (Israel).
L. Shanan, M. Evenari, and N. H. Tadmor.
Israel Exploration Journal, Vol 17, No 3, 1967, p 163-184. 3 tab, 13 fig, 28 ref.

Descriptors: *Rainfall, *Variability, *Dendrochronology, *Climatic data, *Arid lands, Rainfall intensity, Frequency, Cycles, Forecasting, Precipitation (Atmospheric), Growth rate, Plant growth, Annual, Monthly.
Identifiers: *Israel, *Negev Desert, Beersheba, Climatic cycles, Intensity-duration.

The study reported here is concerned with rainfall variability and its impact on agriculture in the Negev Desert in southern Israel. Rainfall in the Negev occurs only in the winter months. It was found that the 45 year span of rainfall records at Beersheba were representative of all other stations in the Negev. Dendrochronological studies showed that annual growth of Zygophyllum dumosum correlated with rainfall at Beersheba. Thus, a 250 year rainfall record was derived. Annual Negev highland rainfall was found to have fluctuated near a mean of 86 mm with a cyclic variation of 28 mm every 50 years. 50 years of above average precipitation were followed by 50 years below average. Fluctuations and trends are in turn correlated with world wide climatic trends as indicated by temperature change, sea level changes, and sunspot activity. Results of the study suggest that additional dendrochronological studies would be useful for predicting trends in the million ha. Negev region. (Crouse-Arizona)

CLIMATE AND THE OCEAN CIRCULATION: 1. THE ATMOSPHERIC CIRCULATION AND THE HYDROLOGY OF THE EARTH'S SURFACE,
Environmental Science Services Administration, Princeton, N.J. Geophysics Fluid Dynamics Lab.

Syukuro Manabe.
Monthly Weather Rev, Vol 97, No 11, p 739-774, Nov 1969. 36 p, 55 fig, 49 ref, append.

Descriptors: *Climatology, *Ocean circulation, *Mathematical models, Ocean currents, Weather, Heat budget, Heat balance, Hydrology, Water temperature, Hydrologic budget, Hydrologic cycle, Atmospheric physics.
Identifiers: General atmospheric circulation model.

The effect of the hydrology of the earth's surface is incorporated into a numerical model of the general circulation of the atmosphere, using the primitive equation of motion. The nine levels of the model are distributed so as to resolve the surface boundary layer and stratosphere. The depletion of solar radiation and the transfer of the terrestrial radiation are computed taking into consideration cloud and atmospheric absorbers such as water vapor, carbon dioxide, and ozone. The scheme involves the prediction of water vapor in the atmosphere and the prediction of soil moisture and snow cover. In order to represent the moisture-holding capacity of soil, the continent is assumed to be covered by boxes, which can store limited amounts of water. The ocean surface is idealized to be a completely wet surface without any heat capacity. The temperature of the earth's surface satisfies the condition of heat balance. The horizontal distribution of rainfall is in excellent qualitative agreement with the observations. Some features of the spatial distributions of heat and water balance components at the earth's surface also agree well with those obtained by Budyko for the actual atmosphere. (Knapp-USGS)
W70-01853

CLIMATE AND THE OCEAN CIRCULATION: 2. THE ATMOSPHERIC CIRCULATION AND THE EFFECT OF HEAT TRANSFER BY OCEAN CURRENTS,
Environmental Sciences Services Administration, Princeton, N.J. Geophysics Fluid Dynamics Lab.
Syukuro Manabe.
Monthly Weather Rev, Vol 97, No 11, p 775-805, Nov 1969. 31 p, 54 fig, 1 tab, 22 ref.

Descriptors: *Climatology, *Ocean circulation, *Mathematical models, Ocean currents, Weather, Heat budget, Heat balance, Hydrology, Water temperature, Hydrologic budget, Hydrologic cycle, Atmospheric physics, Evaporation.
Identifiers: General atmospheric circulation model.

A general circulation model of the joint ocean-atmosphere system is constructed by combining an ocean model and an atmospheric model. The quantities exchanged between the oceanic part and the atmospheric part of the joint model are momentum, heat, and water. Integration of the atmospheric part yields the surface wind stress, net radiation, sensible heat flux, rates of rainfall and snowfall, rates of evaporation and sublimation, and rates of runoff and iceberg formation, all of which constitute the upper boundary conditions for the oceanic part of the model. From the oceanic part, the thickness of ice and the distribution of sea-surface temperature, which constitute the lower boundary conditions for the atmospheric part of the model, are computed. Since the thermal relaxation time of the oceanic part of the model is much longer than that of the atmospheric part, a special technique for economizing the computation time is developed. A detailed analysis of the final solution at the end of the integration is carried out. According to this analysis, the distributions of various heat balance components such as radiation flux and the turbulent flux of sensible and latent heat compare favorably with the corresponding distributions in the actual atmosphere. It is possible to identify the effect of an ocean circulation on the general circulation of the atmosphere. (Knapp-USGS)
W70-01854

CLIMATE AND THE OCEAN CIRCULATION: 3. THE OCEAN MODEL,
Environmental Science Services Administration, Princeton, N.J. Geophysics Fluid Dynamics Lab.
Kirk Bryan.
Monthly Weather Rev, Vol 97, No 11, p 806-827, Nov 1969. 22 p, 18 fig, 6 tab, 28 ref.

Descriptors: *Climatology, *Ocean circulation, *Mathematical models, Ocean currents, Weather, Heat budget, Heat balance, Hydrology, Water temperature, Hydrologic budget, Hydrologic cycle, Atmospheric physics, Evaporation.
Identifiers: General atmospheric-oceanic model.

An ocean model used in a calculation of the earth's climate is described in detail. Temperature and salinity are treated separately. Density is calculated with an accurate equation of state for sea water. The model also includes a method for calculating the growth and movement of sea ice. Due to the very slow adjustment of the deep water in the ocean model, a numerical integration extending over the equivalent of a century fails to reach a climatic equilibrium. At the termination of the run, the surface layers of the ocean show little change with respect to time, but the average heating rate for the ocean as a whole is 2 deg per century. The salinity patterns at the termination of the run are highly realistic compared to observations. The calculation indicates that the thermal 'relaxation' time of the ocean is too long for a numerical integration of the time-dependent equations to be a practical method of finding an equilibrium solution, and new methods should be sought for future calculations of this type. (Knapp-USGS)
W70-01855

A PRELIMINARY STUDY OF STORM MAXIMIZATION BY MOISTURE CHARGE METHOD,
Institute of Tropical Meteorology, Poona (India).
O. N. Dhar, and P. R. Mhaiskar.
Indian J Meteorol and Geophys, Vol 19, No 4, p 427-430, Oct 1968. 4 p, 1 fig, 2 tab, 6 ref.

Descriptors: *Storms, *Design storm, *Rain, *Moisture, Moisture availability, Surveys, Mapping, Seasonal, Rainfall, Dew, Floods, Design flood, Distribution patterns, Meteorology.
Identifiers: *India, Maximum rainstorm.

Calculation of maximum rainstorms by moisture charge has been attempted for the southern half of the Indian Peninsula from Latitude 8 deg N to about Latitude 12 deg N. The use of the moisture charge method is based on the following assumptions: the rainfall can be expressed as the product of available moisture, storm efficiency, and inflow wind; the most effective combination of storm efficiency and inflow wind has been closely approached in the major storms recorded in the area. The average maximization factors range from 2 to 26% and these are generally low during the months of October to December. (Gabriel-USGS)
W70-01864

A BRIEF STUDY OF RAINFALL AND SPILLWAY DESIGN STORM FOR THE GODAVARI BASIN UP TO PAITHAN DAM SITE,
Institute of Tropical Meteorology, Poona (India).
O. N. Dhar, P. R. Mhaiskar, and G. C. Ghose.
Indian J Meteorol and Geophys, Vol 19, No 4, p 413-420, Oct 1968. 8 p, 6 fig, 4 tab, 1 ref.

Descriptors: *Rainfall, *Design storm, *Design criteria, Dams, River basins, Variability, Lakes, Rivers, Mapping, Monsoons, Seasonal, Frequency analysis, Statistical methods.
Identifiers: *India, Spillway design rainstorm.

Mean monthly and annual rainfall data for the Godavari basin up to the Paithan damsite, India, were analyzed using the isohyetal method. Seventy three heaviest rain spells in the 1891-1963 period were analyzed by means of the depth-duration method, as well as by Gumbel's statistical method. The mean annual rainfall is about 29 inches and the coefficient of variability is the highest in the central part of the Godavari River basin, about 40 to 44% for monsoon rainfalls. (Gabriel-USGS)

W70-01881

A STUDY OF CLIMATOLOGICAL AND OTHER RAINFALL PATTERNS OVER CENTRAL INDIA,
Regional Meteorological Center, Nagpur (India).
V. C. Bedekar, and A. K. Banerjee.
Indian J Meteorol and Geophys, Vol 20, No 1, p 23-30, Jan 1969. 8 p, 8 fig, 4 ref.

Descriptors: *Climates, *Rainfall, *Rain, *Rainfall disposition, Seasonal, Monsoons, Forecasting, Altitude, Rain gages, Instrumentation, Mapping, Streamflow, Distribution patterns.
Identifiers: *Central India.

A study of rainfall patterns in central India consists of the normal monthly rainfall charts during the monsoon months for the Madhya Pradesh and Vidarbha areas; the spatial distribution of rainfall associated with monsoon depressions moving across Central India; and the character of rainfall at different places in and around a low-level convergence zone occurring over the above area. The use of self-recording raingage charts for local forecasting is also discussed. (Gabriel-USGS)
W70-01887

A PILOT STUDY FOR THE ESTIMATION OF PROBABLE MAXIMUM PRECIPITATION USING HERSHFIELD TECHNIQUE,
Institute of Tropical Meteorology, Poona (India).
O. N. Dhar, and P. P. Kamte.
Indian J of Meteorol and Geophys, Vol 20, No 1, p 31-34, Jan 1969. 4 p, 1 fig, 3 tab, 6 ref.

Descriptors: *Probable maximum precipitation, *Precipitation intensity, *Analytical techniques, Statistical methods, Probability, Rainfall, Frequency, Gaging stations, Mapping, Meteorological data.
Identifiers: *India, Uttar Pradesh.

A statistical technique developed by D. M. Hershfield (1961) is applied for the determination of one-day probable maximum precipitation for the plain areas of Uttar Pradesh using daily rainfall data from 230 stations. A generalized chart of probable maximum precipitation (PMP) based on these recorded data shows that in this region one-day PMP values obtained by this technique are 2 to 4 times the highest observed one-day rainfall during the past 60 to 70 years. (Gabriel-USGS)
W70-01888

MAJOR TEMPERATURE CHARACTERISTICS OF WATER IN THE WEST-CENTRAL PART OF THE CASPIAN SEA (IN AZERBAIDZHAN),
T. Kh. Zulfugarov.
Summary in Russian. Izvestiya Akademii Nauk, Azerbaidzhanskoi, SSSR, Seriya Fiziki Zemli, No 6, p 91-96, 1968. 2 fig, 2 tab, 4 ref.

Descriptors: *Surface waters, *Water temperature, *Seashores, *Sea water, Gaging stations, Hydrologic data, Meteorological data, Seasonal, Ice, Icebergs.
Identifiers: *USSR, Caspian Sea.

A brief history of investigations on the effect of various hydrometeorological parameters on sea water temperature and on the mean annual and monthly temperature values at several hydrometeorological stations is presented. The mean annual water temperature in the western and southern parts of the Central Caspian Sea is 12.5-12.6 deg C and 14.8-15.0 deg C respectively. Dur-

ing cold periods the water temperature difference is 415 deg and during the warm periods this difference does not exceed 1 to 2 deg. Effect of ice and icebergs on the water temperature is disscussed. (Gabriel-USGS)

2C. Snow, Ice, and Frost

GLACIER DRAINAGE CONNECTED WITH ICE STRUCTURES,
Uppsala Univ. (Sweden). Dept. of Physical Geography.
Thorsten Stenborg.
Geogr Ann, Vol 50, No 1, Ser A, p 25-53, 1968. 29 p, 22 fig, 7 tab, 60 ref.

Descriptors: *Runoff, *Glaciers, *Drainage, Ablation, Melting, Ice, Karst, Sediments, Melt water, Regimen.
Identifiers: *Sweden, *Mikkaglaciaren, Glacial drainage, Ice structures.

Systematic observations on Mikkaglaciaren in northern Sweden are presented and a general discussion is given concerning drainage connected with structures in the upper layer of a glacier. The basic conditions (surface drainage and structural pattern) for this drainage are first analyzed. A series of observations on 'drainage structures' during a five-year period is presented and reproduced on a map. Descriptions and comments are given as to the formation and further development of observed glacier mills and related features, with regard to local environmental characteristics and to the time factor involved. (Knapp-USGS)

EVAPORATION FROM BARE SOIL UNDER HIGH RADIATION CONDITIONS,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Land Research and Regional Survey.
C. W. Rose.
9th International Congress of Soil Science, Adelaide, Australia, 1968, Transactions, Vol 1, p 57-66. 10 p, 1 tab, 12 ref.

Descriptors: *Evaporation, *Solar radiation, *Arid lands, *Meteorological data, *Soil water movement, Energy budget, Soil water, Temperature, Soil temperature, Soil profiles, Soil physical properties, Moisture content, Equations.
Identifiers: *Australia, *Vapor flux, *Water transport, Vapor phase, Liquid phase.

The theory of Penman or Ferguson for predicting rate of evaporation from meteorological data is completely inapplicable when evaporation is limited by water transport in soil. Such conditions are common in arid lands with high levels of radiation. This paper presents a theory that enables evaporation from bare soil to be calculated from water content and temperature profiles. The theory was tested on an experimental site near Alice Springs, Australia. Evaporation over any time period is equated to the sum of upward liquid and vapor phase water fluxes at any depth in the soil and decrease in water stored in soil to that depth over the same interval. Vapor phase transport was found to be very important under conditions of bare soil and high evaporative potential. (Crouse-Arizona)

THE DIFFERENCE BETWEEN RAINFALL AND POTENTIAL EVAPORATION IN FLORIDA,
Geological Survey, Washington, D.C.
F. N. Visher, and G. H. Hughes.
Florida Dep Natur Resources, Bur Geol Map Ser No 32, Aug 1969. 1 sheet, 1 fig, text, 1 map, 5 ref.

Descriptors: *Rainfall-runoff relationships, *Evaporation, *Florida, Hydrologic budget, Water balance, Climatology, Synoptic analysis, Regional analysis, Streamflow, Streamflow forecasting, Hydrologic data.
Identifiers: Evaporation-rainfall relationships (Fla).

Rainfall-potential evaporation differences in Florida are computed and shown by a contour map. The areal distribution of potential evaporation was taken from published sources. Rainfall data were compiled from U.S. weather Bureau records. Average rainfall ranges from about 46-66 inches annually, and estimated evaporation ranges from about 54-46 inches. The difference between rainfall and evaporation ranges from about 18 inches in the northwest to about zero in the southwest. (Knapp-USGS)
W70-01881

2E. Streamflow and Runoff

YIELD OF STREAMS IN MASSACHUSETTS,
Massachusetts Univ., Amherst. Dept. of Civil Engineering.
G. R. Higgins.
Mass Univ Water Resources Res Center Interim Rep, Mar 1967. 175 p, 14 fig, 4 tab, 20 ref, 4 append. OWRR Proj No A-003-MASS.

Descriptors: *Water yield, *Streamflow, *Massachusetts, *Hydrologic data, *Data collections, Droughts, Runoff, Hydrographs, Duration curves, Frequency analysis, Water storage, Climates, Precipitation (Atmospheric).
Identifiers: Storage-yield curves.

Results of studies on the yield of gaged streams in Massachusetts are summarized. Additional material includes introduction of computer methods for determining yield values and extension of the data. Data and comments concerning the recent drought in the Northeast and description of current research projects are introduced. A discussion of results to date and recommendations for future studies are also included. Runoff for the last five years has been extremely low and there are many who feel that the current drought is one of very rare occurrence. Design data including these years may be unrealistic. SEASONAL VARIATION OF STREAMFLOW IN FLORIDA,
Geological Survey, Washington, D.C.
W. E. Kenner.
Florida Dep Natur Resources, Bur Geol Map Ser No 31, July 1969. 1 sheet, 2 fig, 1 map.

Descriptors: *Streamflow, *Regional analysis, *Climatology, *Florida, Climatic data, Hydrologic data, Runoff, Rainfall-runoff relationships, Base flow, Aquifers, Rainfall, Seasonal, Wet seasons.
Identifiers: Seasonal streamflow variation (Fla).

Data on the seasonal variation of streamflow of 10 Florida rivers are compiled and shown by graphs. Florida's pattern of streamflow variation is unusual in two respects. First, the month-to-month variation in average streamflow is relatively small; second, the seasonal variations of streams in different sections of the state are different. The small month-to-month variability in streamflow is the result of (1) the relatively low variability of average monthly rainfall; (2) the relatively high rate of evapotranspiration in the summer; (3) the large volume of slowly released natural storage in Florida's numerous lakes; and (4) the large and relatively stable inflow of groundwater to streams from extensive limestone and alluvial aquifer systems. Florida's unusual pattern of seasonal variation of streamflow is due largely to its position in the transition zone between the continental weather pattern of southeastern United States and the tropical weather pattern of the Caribbean Sea. During the winter and early spring the continental pattern predominates in northern Florida. Florida's summer and fall climate is sub-tropical and is characterized by local thunderstorms. The line of demarcation between areas dominated by the two weather types is not sharp. The continual north-south shifting of the tropical and continental air masses results in a seasonal distribution of rainfall that has a predominantly continental pattern in northwestern Florida, is less continental and more tropical in central Florida, and is predominantly tropical in southern Florida. (Knapp-USGS)
W70-01880

SURFACE WATER SUPPLY OF THE UNITED STATES, 1961-65: PART 6. MISSOURI RIVER BASIN.
Geological Survey, Washington, D.C.

Avail from Superintendent of Doc, US Government Printing Office, Wash DC, 20402. Geol Surv Water-Supply Pap 1919, 1969. 805 p, 1 fig, 1 plate, index.

Descriptors: *Data collections, *Surface waters, *Streamflow, *Missouri River, *Nebraska, Missouri, Kansas, Colorado, Iowa, Stream gages, Lakes, Reservoirs, Stage-discharge relations, Water temperature.
Identifiers: Surface water records, Water resources data, Missouri River Basin.

The surface-water records for the 1961-65 water years for gaging stations, partial-record stations, and miscellaneous sites in the Missouri River basin are presented. The data generally comprise a description of the station and a table showing the daily discharge and monthly and yearly discharge of the stream. The description of the station gives the location, drainage area, records available, type and history of gages, average discharge, extremes of discharge, and general remarks. The type of gage currently in use and the datum of the gage above mean sea level, and a condensed history of the

types, locations, and datums of previous gages used during the period of records available are listed. Information on the accuracy of the records and conditions which affect the natural flow is given under 'Remarks.' Daily discharges, average discharge, extremes, yearly totals, and peak discharges are listed in a table. (Knapp-USGS)
W70-01884

SURFACE WATER SUPPLY OF THE UNITED STATES, 1961-65: PART 6. MISSOURI RIVER BASIN.
Geological Survey, Washington, D.C.

Avail from Superintendent of Doc, US Government Printing Office, Wash DC, 20402. Geol Surv Water-Supply Pap 1918, 1969. 751 p, 1 fig, 1 plate, index.

Descriptors: *Data collections, *Surface waters, *Streamflow, Hydrologic data, Missouri River, Stream gages, Lakes, Reservoirs, Stage-discharge relations, Discharge (Water).
Identifiers: *Surface water records, *Missouri River basin, Water resources data.

The surface-water records for the water years 1961-65 for gaging stations, partial-record stations, and miscellaneous sites in the Missouri River basin are presented. The data generally comprise a description of the station and a table showing the daily discharge and monthly and yearly discharge of the stream. The description of the station gives the location, drainage area, records available, type and history of gages, average discharge, extremes of discharge, and general remarks. The type of gage currently in use and the datum of the gage above mean sea level, and a condensed history of the types, locations, and datums of previous gages used during the period of records available are listed. Information on the accuracy of the records and conditions which affect the natural flow is given under 'Remarks.' Daily discharges, average discharge, extremes, yearly totals, and peak discharges are listed in a table. (Knapp-USGS)

NATIONAL INVENTORY OF SURFACE WATER RESOURCES - VOLUME 1,
Ministry of Public Works, Caracas (Venezuela).
Alfredo Lopez.
Repub of Venezuela, Comm for Nat Plan of Water Develop Spec Publication, Feb 1969. 34 p, 3 tab, 6 ref, append.

Descriptors: *Data collections, *Hydrologic data, *Surface waters, *Surveys, Runoff, Streamflow, Precipitation (Atmospheric), Water resources development, Climates, Hydrography.
Identifiers: *Venezuela, Surface water inventory.

An inventory of the surface water resources data of Venezuela includes information on streamflow, water quality, and water availability. A mean annual isohyetal map, a mean annual isothermic map, a nationwide estimate of evapotranspiration, and mean national runoff volume were prepared. Regional mean annual runoff values are tabulated. Major rivers and their annual flows are listed. (Knapp-USGS)

DRAINAGE DENSITY AS AN INDICATOR OF BASE FLOW IN PART OF THE POTOMAC RIVER BASIN,
Geological Survey, Washington, D.C.
Frank W. Trainer.
In: Geol Surv Res 1969, Prof Pap 650-C, p C177-C183, 1969. 7 p, 4 fig, 2 tab, 11 ref.

Descriptors: *Base flow, *Drainage density, Runoff, Streamflow, Hydrographs, Hydrograph analysis, Stream gages, Streamflow forecasting, Hydrogeology, Mapping.
Identifiers: Drainage density-base flow relations.

The base flow from 10 stream basins in an area of 1,900 square miles in the Piedmont and Blue Ridge provinces in Pennsylvania, Maryland, and Virginia, as determined by hydrograph separation, is inversely proportional to drainage density. This relationship was used to estimate the base flow from ungaged basins in the area. Streamflow records from two gages on the Potomac River, also studied by hydrograph separation, define the contribution of the entire area to the discharge of the river and provide a check on the estimate made by drainage density. For a 1-year period the estimate of base flow from the ungaged basins, made by the use of drainage density, is within 45% of the estimate from hydrograph separation. This agreement suggests that drainage density will be useful in hydrogeologic mapping and in planning streamflow measurements for the study of base flow. (Knapp-USGS)

Emil Liteanu, Mircea Feru, Mihai Croitoru, Natalia Golita, and Eugen Golita.
Studii Tehnice si Economice, Seria E, Hidrogeologie, No 7, Studii de Hidrogeologie, p 7-58, 1967. 4 fig, 6 tab, 39 ref. Summaries in English and French.

Descriptors: *Hydrogeology, *Aquifers, *Hydrologic properties, Geology, Boreholes, Artesian wells, Water supply, Coals, Hydrostatic pressure, Altitude, Discharge (Water), Water sources, Chemical analysis.
Identifiers: Rumania, Getic depression.

Geological and hydrological conditions of the Getic depression were investigated by using geological, geochemical, and hydrological observations. The surface rocks of the depression are of Pliocene and Quaternary age. Several aquifers separated by coal beds are under pressure varying from 3.7 to 1.2 atm. It is believed that these artesian aquifers are well suited for agricultural or industrial uses. (Gabriel-USGS)

GEOLOGY AND GROUND WATER RESOURCES OF WILLIAMS COUNTY, NORTH DAKOTA: PART 3 - HYDROLOGY,
Geological Survey, Washington, D.C.
C. A. Armstrong.
N Dak Geol Surv Bull 48 and N Dak State Water Comm County Ground Water Studies 9, 1969. 82 p, 22 fig, 2 plate, 2 tab, 34 ref.

Descriptors: *Water resources, *Groundwater, *North Dakota water wells, Hydrologic data, Data collections, Aquifers, Water quality, Water yield, Water levels, Water Supply, Recharge, Permeability.
Identifiers: *Williams County (N Dak).

Groundwater in Williams County, North Dakota, is obtained from aquifers in the glacial drift of Quaternary age, the Fort Union Group of Tertiary age, and the Dakota Group of Cretaceous age. Three of the more productive aquifers are the Little Muddy, Ray, and Grenora; these aquifers are composed of sand and gravel that was deposited in the ancestral Yellowstone, Little Missouri, and Missouri River valleys, respectively. Properly constructed wells in the more permeable parts of these glacial aquifers can be expected to yield more than 500 gallons per minute. Yields of more than 500 gpm are also obtainable from the more permeable parts of the Trenton and Hofflund aquifers in the proglacial Yellowstone and Missouri River valleys. Yields of 50 to 500 gpm are obtainable from some outwash and buried glaciofluvial deposits in the northern part of the county and from some of the finer sand deposits in the 5 major aquifers. Water from the glacial drift aquifers differs greatly in quality. Generally it is very hard and of a calcium bicarbonate type. Water in the Fort Union Group consists of 2 types; a soft sodium bicarbonate water, and a hard sodium sulfate bicarbonate water. Generally it is too saline for human consumption or irrigation. Water from the Dakota is used for pressure maintenance in oil fields, but is too saline for most other uses. (Knapp-USGS)
W70-01685

OBSERVATIONS OF THE PRESSURE SURFACE IN THE AQUIFER OF AN IRRIGATION DISTRICT AT MERBEIN, AUSTRALIA,
Commonwealth Scientific and Industrial Research Organization, Merbein (Victoria). Div. of Horticultural Research.
J. Groot Obbink.
J Hydrol, Vol 9, No 3, p 294-306, Nov 1969. 13 p, 6 fig, 3 tab, 8 ref.

Descriptors: *Water levels, *Aquifers, *Irrigated land, *Irrigation effects, Water level fluctuations, Saturated soils, Water table, Groundwater movement, Piezometers, Hydrogeology, Sands.
Identifiers: *Australia, Merbein (Victoria).

To observe the pressure surface in the aquifer in the Merbein Irrigation District, which is situated on the River Murray in Northwest Victoria, one piezometer was installed in 1952 and a further nine piezometers were installed in 1960. The aquifer is a Post-Tertiary water bearing sand located at depths ranging from 14 to 75 ft from the surface. The bedrock, consisting of paleozoic rock, is estimated to be about one thousand feet below the soil surface. Location of piezometers and depth of the aquifer below soil surface at each piezometer site are given. Information obtained over a period of eight years has shown that the pressure surface is not constant but in general has risen, although at different rates for each piezometer site. The increases ranged from 0.35 ft to 2.49 ft, while one piezometer site has shown a decrease of 1.25 ft. The pressure surface in the piezometer installed in 1952 has risen by 5.29 ft over a period of 15 years. The rise of pressure surface, the direction of flow, the quality of the water in the aquifer and the potential danger for certain low-lying areas are discussed. (Knapp-USGS)

GROUND-WATER INFLOW TOWARD JORDAN VALLEY THROUGH CHANNEL FILL IN SEVEN CANYONS IN THE WASATCH RANGE NEAR SALT LAKE CITY, UTAH,
Geological Survey, Salt Lake City, Utah.
R. W. Mower.
In: Geol Surv Res 1969, Prof Pap 650-C, p C174-C176, 1969. 3 p, 2 fig, 1 tab, 4 ref.

Descriptors: *Groundwater movement, *Inflow, *Alluvium, *Alluvial channels, *Utah, Hydraulic conductivity, Transmissivity, Recharge, Discharge (Water), Water levels, Water table, Underflow, Groundwater basins.
Identifiers: Wasatch Range, Salt Lake City (Utah).

The estimated quantity of underflow moving toward the Jordan Valley in the channel fill of 7 major canyons in the Wasatch Range near Salt Lake City, Utah, is 3,400 acre-feet of water per year. About 2,000 acre-feet of this water is discharged by springs and wells before it reaches the principal groundwater reservoir in the valley, leaving about 1,400 acre-feet per year available for recharge. About 93% of the recharge is from Little Cottonwood Creek Canyon and 7% from the other 6 canyons. (Knapp-USGS)

GEOLOGICAL AND HYDROGEOLOGICAL OBSERVATIONS IN THE TIRGUL SECUIESC ZONE (ROMANIAN),
Bucharest Inst. of Geology (Rumania).
T. Bandrabur.
Summaries in English and French, Romania, Institutul Geologic, Studii Tehnice si Economice, Seria E, Hidrogeologie No 7, Studii de Hidrogeologie, p 87-103, 1967. 1 fig, 2 tab, 13 ref.

Descriptors: *Water chemistry, *Hydrogeology, *Geology, *Aquifers, Quaternary period, River basins, Water analysis, Chlorine, Sodium, Calcium, Magnesium, Carbonates, Sulfates, Water quality.
Identifiers: *Romania, Tirgul Secuiesc Zone.

Hydrogeology and morphology of the Tirgul Secuiesc Zone, Romania was investigated on the basis of hydrogeological and geochemical studies. Groundwaters of the zone are characterized by mineral contents of 0.450 to 1.600 gr/Kg; however some highly mineralized waters have 2.0-6.0 gr/Kg contents. Fresh water as well as the mineralized waters of the zone belong to five hydrochemical groups as follows: calcium-magnesium bicarbonates; sodium-carbon dioxide-bicarbonates; calcium-chlorine bicarbonates; calcium sulfates; and calcium chlorides. (Gabriel-USGS)
W70-01906

HYDROGEOLOGICAL RESEARCH IN THE DANUBE DELTA (ROMANIAN),
State Geological Committee, Bucharest (Rumania).
E. Liteanu, A. Pricajan, and Maria Mocanu.
Summaries in English and French, Romania Institutul Geologic, Studii Tehnice si Economice, Seria E, Hidrogeologie No 7, Studii de Hidrogeologie, p 59-86, 1967. 1 fig, 3 plate, 7 tab, 8 ref.

Descriptors: *Hydrogeology, *Aquifers, *Deltas, Geology, Quaternary period, Salinity, Underground streams, Discharge (Water), Potable water, Paleozoic era, Mesozoic era, Water chemistry, Calcium, Magnesium, Iron, Chlorine, Ions.
Identifiers: Danube delta.

The presence and distribution of aquifers in the Danube delta was investigated on the basis of geological, hydrological, and geochemical data. Water bearing strata can be found in both the Quaternary basement and deltaic sediments. The aquifers of the basement formations generally have a high mineral content and are of no practical value. The deltaic deposits are characterized by the presence of groundwater flows and can be well utilized, especially the western zone where good drinking water of high discharge is observed. Groundwaters located in the marine delta zone cannot be utilized because of their high salinity content. (Gabriel-USGS)
W70-01907

ORIGIN OF THE MINERALIZATION OF THE PHREATIC WATERS IN THE BUZAU-RIMNICUL SARAT INTERFLUVIAL PLAIN (ROMANIAN),
Babes-Bolyai Univ., Cluj (Rumania).
P. Marosi.
English summary. Romania Institutul Geologic, Studii Tehnice si Economice, Seria E, Hidrogeologie, No 7, Studii de Hidrogeologie, p 105-147, 1967. 8 fig, 8 plate, 4 tab, 33 ref.

Descriptors: *Hydeogeology, *Aquifers, *Mineral water, Climates, Dry seasons, Salinity, Geology, Streamflow, River basins, Water chemistry, Water analysis, Ions, Iron, Sodium, Calcium, Magnesium, Potassium, Sulfates.
Identifiers: *Romania, Buzau-Rimnicul Sarat.

The hydrogeology and hydrochemistry of the Buzau-Rimnicul Sarat area, Romania are discussed. The position of phreatic waters corresponds to the law of hydrogeological zones characterized by the piemontane accumulative structures where, under the effect of dry climate, the hydrochemical zone of the phreatic waters is formed due to the effect of continental salinization processes. The position and the salinity zone of the phreatic water are affected to a large extent by the waters of the Rimnicul Sarat River which penetrates the phreatic horizon. The study separates the area into several districts characterized by their peculiar mineralization, such as phreatic, fluvial, lacustrine, etc. (Gabriel-USGS)
W70-01908

HYDROGEOLOGICAL RESEARCH IN THE BARAOLT BASIN (ROMANIAN),
Gh. Vasilescu, and Neonila Avramescu.
French summary. Romania, Institutul Geologic, Studii Tehnice si Economice, Seria E, Hidrogeologie, No 7, Studii de Hidrogeologie, p 151-171, 1967. 3 plate, 1 tab, 4 ref.

Descriptors: *Hydrogeology, *River basins, *Aquifers, Boreholes, Wells, Pumping, Water supply, Water storage, Drainage water, Porosity, Permeability, Infiltration, Carbon dioxide, Methane, Coals.
Identifiers: *Romania, Baraolt basin.

To evaluate the hydrogeological conditions of the coal deposits of the Baraolt basin, the water-bearing strata of the basin were investigated down to a depth of 150 feet. Analysis of the experimental pumping well data shows that the amount of water discharge is a function of the horizon permeability and grain size. Carbon dioxide and weak emanations of methane gas are present in the aquifers, with the carbon dioxide content somewhat increasing with depth. Hydrological conditions of the coal deposits are of a very difficult and complicated nature. (Gabriel-USGS)

PROPERTIES OF SOME SOILS IN THE CUMBERLAND PLATEAU AS RELATED TO SLOPE ASPECT AND POSITION,
Soil Conservation Service, Beltsville, Md.; Soil Conservation, Knoxville, Tenn.; and Forest Service (USDA), Somerset, Ky.

D. P. Franzmeier, E. J. Pedersen, T. J. Longwell, J. G. Byrne, and C. K. Losche.
Soil Sci Soc Amer Proc, Vol 33, No 5, p 755-761, Sept-Oct 1969. 7 p, 3 fig, 7 tab, 12 ref.

Descriptors: *Soils, *Slopes, *Soil physical properties, *Soil chemical properties, *Geomorphology, Soil temperature, Soil moisture, Soil horizons, Storage capacity.
Identifiers: Soils of Kentucky, Soils of Tennessee, Base saturation, Slope aspect, Topography-soil formation relations.

Soils developed from acid siltstones and shales were sampled on the lower, middle, and upper part of steep north and south-facing slopes in transects made across ridges in eastern Kentucky and Tennessee. Particle size distribution, base saturation, and soil temperature are related to slope position. Soils in the middle slope positions are higher in coarse material than those in the upper or lower positions. Soils in the lower slope positions have the highest base status and are coolest. Slope aspect influences soil temperature and organic matter content and the kinds of horizons formed and their color. Most soils on the south-facing slopes have argillic horizons while most on the north-facing slopes have cambic horizons. Soils on the north slope have almost 2C lower mean annual temperature, contain more organic matter, are darker in color, and hold more water during a period of water stress than soils on the south-facing slope. (Carstea-USGS)

INFILTRATION AND WATER DEPLETION IN LYSIMETERS,
Arizona Univ., Tucson. Dept. of Agricultural Chemistry and Soils.
Hasan K. Qashu.
Soil Sci Soc Amer Proc, Vol 33, No 5, p 775-778, Sept-Oct 1969. 4 p, 3 fig, 6 ref.

Descriptors: *Lysimeters, *Water loss, *Infiltration, *Rainfall-runoff relationships, *Evapotranspiration, Forecasting, Moisture content, Water balance, Runoff, Soil water movement, Soil physical properties, Soil moisture, Vegetation effects.
Identifiers: Evapotranspiration forecasting.

Evapotranspiration losses from five lysimeters with different plant species were estimated. Prediction equations were developed and used to estimate soil water regimens, infiltration, and runoff in lysimeters with vegetative cover. Calculated soil water contents and runoff for lysimeters with 5 different plant species were good estimates of measured quantities. Water balance elements from tree-, brush-, and grass-covered soils showed variabilities between species and for total season precipitation. It is concluded that the presented procedure of estimating the elements of water balance is useful in areas with limited data. But for a physical explanation of the cause and effects in surface water/soil water continua, hydrologic relations must be sought through mathematical analysis of a time-varying system. Derived equations for estimating soil water depletion and infiltration predictors are very useful first approximations for the evaluation of 2 elements-- runoff and water storage--in the hydrologic cycle. They reveal the importance of vegetation, specifically plant species, as a principal component in the rainfall-runoff process. (Carstea-USGS)
W70-01650

EFFECTS OF PETROLEUM MULCH ON SOIL WATER CONTENT AND SOIL TEMPERATURE,
Oregon State Univ., Corvallis. Dept. of Soils.
Ahang Kowsar, L. Boersma, and G. D. Jarman.
Soil Sci Soc Amer Proc, Vol 33, No 5, p 783-786, Sept-Oct 1969. 4 p, 6 fig, 1 tab, 14 ref. OWRR Proj B-001-ORE.

Descriptors: *Soil management, *Mulching, *Soil moisture, *Soil temperature, Evaporation control, Soil conservation, Infrared radiation, Soil physical properties, Water loss, Storage capacity, Soil water movement.
Identifiers: Petroleum mulch.

Soil temperature and soil water content were measured at 2-hour intervals in mulched and unmulched chehalis silty clay loam subjected to a diurnal temperature cycle. At the time the soil temperatures attained their maximum value at a depth of 1 cm, the mulch-covered soil was 5C warmer than the bare soil; at all other times the difference in temperature between bare and mulched soil was smaller. In the upper 1 cm of mulched soil, water was lost but the soil gained water at depths where seedlings are normally placed. It was concluded that the petroleum mulch improved soil water and soil temperature conditions. (Carstea-USGS)
W70-01651

RESOLVING TIME, MASS ABSORPTION COEFFICIENT AND WATER CONTENT WITH GAMMA-RAY ATTENUATION,
Iowa State Univ., Ames.
D. D. Fritton.
Soil Sci Soc Amer Proc, Vol 33, No 5, p 651-655, Sept-Oct 1969. 5 p, 1 fig, 4 tab, 8 ref. AEC OWRR Proj A-003-IA.

Descriptors: *Nuclear moisture meters, *Soil moisture meters, *Calibrations, *Gamma rays, *Soil moisture, Analytical techniques, Soil physical properties, Instrumentation, Soil types, Soil texture, Absorption, Moisture content.
Identifiers: *Resolving time, Mass absorption coefficient, Gamma-ray attenuation, Gamma-ray scattering, Gamma-ray calibration, Gamma-ray intensity correction.

An intensity correction for gamma-ray attenuation is determined by using the minute nonlinearity of a semi-log plot of gamma-ray intensity versus the thickness or the product of thickness and density of a material. The experimentally determined correction is expressed in terms of resolving time and varied with both material and counting rate. A correction of 5.0 microseconds/count was determined experimentally as the best resolving time to correct the observed counting rates for water content determination. Part of the correction was evidently due to causes other than resolving time. Mass absorption coefficients of water and soil were 0.08105 and 0.07309 sq cm, respectively, with no correction and were 0.0871 and 0.0773 sq cm with a 5.0 microsecond/count correction. The difference between gravimetric water content and gamma-ray water content dropped from 3.02% to 0.60% when this correction was used. (Carstea-USGS)
W70-01652

EVALUATING THE USE OF Na, Ca, AND DIVALENT CATION ELECTRODES IN SOME SOIL EXTRACTING SOLUTIONS,
Hawaii Inst. of Geophysics, Honolulu.
S. A. El-Swaify, and M. N. Gazdar.
Soil Sci Soc Amer Proc, Vol 33, No 5, p 665-667, Sept-Oct 1969. 3 p, 3 fig, 2 tab, 17 ref. Contract No 14-01-0001-673 (Office of Saline Water).

Descriptors: *Electrodes, *Chemical potential, *Ions, *Calibrations, Calcium, Magnesium, Salts, Aqueous solutions, Analytical techniques, Instrumentation, Spectrophotometry, Colorimetry, Membranes, Sodium, Soil moisture.
Identifiers: Activity, Activity coefficient.

The performances of sodium activity, calcium activity, and divalent cation activity electrodes were determined and compared with predicted theoretical responses in unbuffered systems and in buffered systems at concentrations of 0.2 m, 0.5 m, and 1.0 m. In support of previous findings on a less selective sodium electrode, results show that the Na-electrode exhibits a response which is nearly Nernstian, allowing good estimates of Na ion activities in soil extracts. In contrast, the usefulness of the calcium and divalent-electrodes in buffered systems (and subsequent usefulness for determining exchangeable ions) was found to be limited particularly at high levels of total salt concentration. Although better response was observed for these two electrodes in unbuffered systems, the determination of Ca and Mg in water-soil extracts by their combined use is limited by the apparent reversibility of the calcium electrode to Mg ions present in calcium-magnesium salt mixtures. (Carstea-USGS)
W70-01653

PROFILE MODIFICATIONS OF A SLOWLY PERMEABLE SOIL,
Agricultural Research Service, Bushland, Tex. Southwestern Great Plains Research Center.
H. V. Eck, and H. M. Taylor.
Soil Sci Soc Amer Proc, Vol 33, No 5, p 779-783, Sept-Oct 1969. 5 p, 3 fig, 5 tab, 9 ref.

Descriptors: *Soil profiles, *Permeability, *Irrigation, *Cultivation, Soil types, Soil texture, Storage capacity, Water conservation, Soil physical properties, Soil water, Soil water movement, Productivity, Deep tillage, Texas.
Identifiers: Southwestern Great Plains Research Center, Soil profile modification, Water use efficiency.

Soil profile modification was studied in a Pullman silty clay loam at the Sothwestern Great Plains Research Center, Bushland, Texas. Three depths of profile modification (0, 90, and 150 cm) were studied under two water levels (preplant irrigation and full irrigation). Grain sorghum yields increased by 66.2 and 80.1% under limited water conditions when the profiles were modified to depths of 90 and 150 cm, respectively. Changes in amount and distribution of stored water and in rooting patterns resulted in the increased yields. Water use efficiency was increased under adequate irrigation, but there was little effect on total yields. (Carstea-USGS)
W70-01656

CONDUCTIVITY INSTRUMENTATION FOR IN SITU MEASUREMENT OF SOIL SALINITY,
Burr-Brown Research Corp., Tucson, Ariz.; and Arizona Univ., Tucson.
C. G. Enfield, and D. D. Evans.
Soil Sci Soc Amer Proc, Vol 33, No 5, p 787-789, Sept-Oct 1969. 3 p, 8 fig, 1 tab, 5 ref.

Descriptors: *Electrical conductance, *Instrumentation, *Salinity, *Soil chemical properties, Soil physical properties, Soil temperature, Aqueous solutions.
Identifiers: Soil salinity meters.

A transducer has been developed which is capable of assessing, in situ, the electrical conductivity of soil water. The transducer is constructed of porous glass with platinum electrodes and operates over the entire field moisture range. The transducer is accurate to within 10% when measured with an associated solid state meter in a conductivity range of 1-20 millimhos/cm at 25C and a temperature range of 5-45C. Typically, the time required to achieve 63% of equilibrium response, in aqueous solutions, is less than 2 hours. (Carstea-USGS)

THE EFFECT OF DRYING ON SOIL STRENGTH PARAMETERS,
National Tillage Machinery Lab., Auburn, Ala.
C. R. Camp, and W. R. Gill.
Soil Sci Soc Amer Proc, Vol 33, No 5, p 641-644, Sept-Oct 1969. 4 p, 3 fig, 1 tab, 12 ref.

Descriptors: *Drying, *Soil strength, *Soil physical properties, *Soil moisture, Cohesion, Shear strength, Water loss, Soil water movement, Bulk density, Soil types, Friction.
Identifiers: *Soil moisture-strength relationships, *Unsaturated media, Triaxial shear strength.

The influence of drying on the magnitudes of the cohesion and friction angle soil strength parameters was determined for three cohesive soils. Shear strength measurements were made using a modified laboratory triaxial apparatus for three different soil types on samples prepared in the laboratory. All samples of a given soil type were molded at the same soil water content and to the same bulk density. Samples were dried slowly to soil water contents between the 1/3-bar soil water suction level and air dryness. The criterion used to determine shear was either the development of a definite failure plane or an increase in sample diameter of 0.25 mm, whichever occurred first. Volume change of the sample and the applied axial and radial stresses were measured and recorded continuously throughout a test cycle. Mohr's circles were constructed and the soil strength parameters were determined for all samples. The parameters both increased with drying for these soils. (Carstea-USGS)
W70-01662

SOIL-WATER HYSTERESIS MEASURED IN A SANDY LOAM AND COMPARED WITH THE HYSTERIC DOMAIN MODEL,
Department of Agriculture, Ottawa (Ontario). Soil Research Inst.
G. C. Topp.
Soil Sci Soc Amer Proc, Vol 33, No 5, p 645-651, Sept-Oct 1969. 7 p, 8 fig, 1 tab, 17 ref.

Descriptors: *Soil water movement, *Hysteresis, *Model studies, *Soil moisture, *Soil physical properties, Soil texture, Gamma rays, Pressure head, Hydraulic conductivity, Instrumentation, Tensiometers, Drying, Wetting, Hydraulic models.
Identifiers: *Soil-water hysteresis, Sandy loam soil, Gamma ray attenuation.

A controlled series of wetting and drying changes was applied to a uniformly packed column of sandy loam soil. The relationships between soil water content, pressure head and hydraulic conductivity were determined in the laboratory. Gamma ray attenuation provided information regarding the soil water content. A pressure transducer was used to measure simultaneous tensiometer pressures at five locations along the soil column. Different levels in the column have been used to map out scanning curves suitable for quantitative tests of the independent domain theory of hysteresis. Analysis of the primary scanning curves showed that the independent domain theory of hysteresis is an inadequate model for both wetting and drying curves. No measurable hysteresis in the water content-hydraulic conductivity relationship was observed following consolidation during the initial drying phase. (Carstea-USGS)

THE PREDICTION OF EVAPORATION, DRAINAGE, AND SOIL WATER STORAGE FOR A BARE SOIL,
Wisconsin Univ., Madison. Dept. of Soil Sciences.
T. A. Black, W. R. Gardner, and G. W. Thurtell.
Soil Sci Soc Amer Proc, Vol 33, No 5, p 655-660, Sept-Oct 1969. 6 p, 8 fig, 18 ref.

Descriptors: *Evaporation, *Drainage, *Water storage, *Soil water movement, Soil moisture, Soil conservation, Storage capacity, Forecasting, Irrigation, Water management (Applied), Drying, Rainfall, Lysimeters, Capillary conductivity, Diffusivity.
Identifiers: Plainfield sand soil.

Evaporation, drainage, and changes in storage for a bare Plainfield sand were measured with a lysimeter during June, July, and August 1967, under natural rainfall conditions. Cumulative evaporation at any stage was proportional to the square root of time following each heavy rainfall. The drainage rate was found to be an exponential function of water storage. Both relations can be predicted from flow theory with knowledge of soil capillary conductivity, diffusivity, and moisture retention characteristics. Using these two relations and daily rainfall data, the water storage in the top 150 cm was predicted over the season to within 0.3 cm. (Carstea-USGS)

PROPERTIES OF VERMICULITES AND SMECTITES: EXPANSION AND COLLAPSE,
Oregon State Univ., Corvallis. Dept. of Soils.
M. E. Harward, D. D. Carstea, and A. H. Sayegh.
Clays and Minerals, Vol 16, p 437-447, 1969. 11 p, 4 fig, 7 tab, 20 ref.

Descriptors: *Analytical techniques, *Clay minerals, *Expansive clays, Moisture uptake, X-ray diffraction, Cation exchange, Beidellite, Bentonite, Montmorillonite, Mineralogy, Potassium, Calcium, Magnesium, Solvation.
Identifiers: Smectite, Vermiculite.

Samples of smectites and vermiculites were evaluated to (1) determine the effects of source and amount of charge; (2) determine if a continuum of properties exists, and (3) improve the basis for differentiating criteria for identification. The montmorillonites expanded to the equivalent two-layer complex upon solvation by condensation of ethylene glycol or glycerol vapor. Beidellite exhibited the one-layer complex with glycerol vapor and the two-layer complex with ethylene glycol. The vermiculite samples did not yield regular two-layer complexes regardless of saturating cation, prior moisture or solvating agent. A number of different complexes of vermiculite were obtained depending on conditions of solvation. Potassium-saturated vermiculites and smectites both exhibited collapsed layers in a dry atmosphere. Hydration of smectites occurred at humidities above 20% and resulted in poorly ordered diffraction maxima of 11-12 angstroms. The K-saturated vermiculites tended to retain the collapsed lattice and exhibited diffraction maxima of 10-10.6 angstroms with integral higher orders. Differences in properties can be related to both source and amount of charge. Nevertheless, a continuum in the properties of expansion and collapse between the smectites and vermiculites was not observed. The data indicate two discrete populations. (Carstea-USGS)

THE ACHIEVEMENTS OF DRAINAGE THEORY IN RELATION TO PRACTICAL NEEDS: TAKING STOCK,
Agricultural Research Council, Cambridge (England). Unit of Soil Physics.
E. C. Childs.
9th International Congress of Soil Science, Adelaide, Australia, Transactions, Vol 1, 1968, p 349-356. 8 p, 23 ref.

Descriptors: *Drainage systems, *Soil physics, *Arid lands, *Irrigation, *Land reclamation, Agriculture, Soil properties, Agricultural engineering, Salinity, Hydraulic conductivity, Equations, Water table, Irrigation efficiency.
Identifiers: *U. A. R., Drainage Theory, Parameters.

Theoretical soil physics and laboratory research techniques have developed more rapidly in recent years than methods for field application. In the area of drainage problems the author proposes that emphasis be placed on development of practical methods of measurement of parameters relative to soil drainage so that the body of theory can be applied more effectively to agriculture. In arid lands where irrigation is the water source, empirical methods are probably adequate since the excess of water applied is predictable. Although a field manual for agriculturalists is not practical, a consultant well versed in theory can offer advice on large-scale problems that is superior to guess work based only on experience. An example is cited in the land reclamation project in the Lake Mariyut area on the north coast of the U. A. R. Drainage theory has made it possible to forecast here the level of a steady water table under irrigation within acceptable limits. (Crouse-Arizona)

THE INFLUENCE OF SUBSURFACE ASPHALT BARRIERS ON THE WATER PROPERTIES AND THE PRODUCTIVITY OF SAND SOILS,
Michigan State Univ., East Lansing.
A. E. Erickson, C. M. Hansen, and A. J. M. Smucker.
9th International Congress of Soil Science, Adelaide, Australia, 1968, Transactions, Vol 1, p 331-337. 7 p, 4 tab, 1 fig.

Descriptors: *Arid lands, *Sands, *Impervious membranes, *Asphalt, *Barriers, Economic feasibility, Vegetable crops, Nuclear moisture meters, Arizona, Michigan, Soil-water-plant relationships, Soil properties, Root zone, Moisture tension, Drainage, Penetration.
Identifiers: *Taiwan, Formosa.

Field trials were made with placement of an impervious asphalt barrier at various depths in sandy soils in Michigan, Arizona, and Taiwan, Formosa. The barrier increases the amount of water held in the root zone of crops. Aerial extent of the barrier is determined by drainage requirements. Soil moisture measurements were made by the nuclear probe method in arid soils. The technique has made irrigation economically feasible for high value crops. (Crouse-Arizona)

THEORY AND EXPERIMENT IN CANAL SEEPAGE ESTIMATION USING RADIOISOTOPES,
Bhabha Atomic Research Center, Bombay (India). Isotope Div.
K. Krishnamurthy, and S. M. Rao.
J Hydrol, Vol 9, No 3, p 277-293, Nov 1969. 17 p, 6 fig, 2 tab, 14 ref.

Descriptors: *Canal seepage, *Radioactivity techniques, *Tracers, *Tracking techniques, *Reviews, On-site investigations, Seepage, Soil water movement, Groundwater movement, Mathematical studies, Mathematical models.
Identifiers: *India, Ganga Canal.

A brief survey of the many existing computational and experimental methods in estimating seepage losses from unlined canals is given. A new method is suggested in which the filtration velocity of seepage is measured using radioisotopes. The seepage rate is then computed from the knowledge of the phreatic curve and Numerov's theoretical formula for laterally spreading seepages from unlined canals. A practical application of the procedure to estimate seepage losses from Ganga Canal near Roorkee, India is also described. (Knapp-USGS)

SULPHATE DISTRIBUTION IN SOLONETZIC SOIL WITH A WATER TABLE,
Alberta Univ., Edmonton. Dept. of Soil Science.
S. U. Khan, and G. R. Webster.
J Soil Sci, Vol 19, No 1, p 20-24, Mar 1968. 5 p, 1 fig, 1 tab, 9 ref.

Descriptors: *Water chemistry, *Soil chemistry, *Soil water movement, *Sulfates, Ion transport, Aqueous solutions, Adsorption, Mineralogy, Clay minerals.
Identifiers: Solonetz, Sulfate mobility.

Soil columns were used to study sulphate distribution in Thin Duagh Loam soil as influenced by the presence of a water table. The concentration pattern showed that retention was greater in the surface soil than at lower depths. The data suggest that sulphate tends to move more slowly than water in soil. Evaporation would affect the distribution pattern but in this study its influence was negligible because it was maintained at a low level. In the lower horizons the sulphate concentration in the column decreased with decreasing acidity of the soil horizons. In this soil montmorillonite is the major clay mineral and it appears that increase in percentage of clay reduced sulphate retention in the lower horizons. The greater sulphate retention near the surface resulting from high water table in the soil under study might have some effect on the productivity of these soils. (Knapp-USGS)
W70-01866

WATER MOVEMENT IN DRY SOILS: 1. PHYSICAL FACTORS AFFECTING SORPTION OF WATER BY DRY SOIL,
Rothamsted Experimental Station, Harpenden (England).
D. A. Rose.
J Soil Sci, Vol 19, No 1, p 81-93, Mar 1968. 13 p, 9 fig, 4 tab, 9 ref.

Descriptors: *Soil water movement, *Unsaturated flow, Diffusion, Diffusivity, Sorption, Clay minerals, Expansive clays, Expansive soils, Mathematical studies, Model studies, Soil physics, Soil physical properties, Vapor pressure, Evaporation control, Hexadecanol, Temperature.
Identifiers: Atmospheric moisture uptake (Soils).

Semi-infinite columns of dry soil closed at one end had the other exposed to a turbulent atmosphere at constant relative humidity (0.98) and a range of constant temperatures. After varied times the water content of the columns were measured gravimetrically, in 1-cm layers, from which the total quantity taken up and the distribution of water content with time and distance were found. Assuming that the Boltzmann transform can be applied to the standard diffusion equation, two soil parameters are derived. The second parameter--the sorptivity, is not independent of water content or the value maintained at zero distance. Results show that in a clay soil, between pF 5.8 and pF 4.2, water moves predominantly as vapor; in a non-swelling silicate mineral (sepiolite) there is significant liquid movement between pF 5.1 and pF 4.2. Long-continued use of organic manure has little effect on either diffusivity or sorptivity; aggregate size has some effect, in opposite senses for a sand and a clay; a mulch or a still atmosphere affects sorptivity but not diffusivity; evaporation suppressants decrease sorptivity; ignition decreases sorptivity and greatly alters diffusivity; and degradation of structure causes small changes in diffusivity. (Knapp-USGS)

STEADY FLOW OF WATER THROUGH A TWO-LAYER SOIL,
Iowa State Univ., Ames. Dept. of Agronomy.
Sam-Arng Srinilta, D. R. Nielsen, and Don Kirkham.
Pap presented at 50th Annu Meeting of Amer Geophys Union, Wash, DC, Apr 21-25, 1968. 29 p, 17 fig, 1 tab, 12 ref.

Descriptors: *Steady flow, *Soil water movement, *Unsaturated flow, Hydraulic conductivity, Sorption, Bulk density, Soil moisture, Moisture tension, Soil profiles, Soil types, Darcy's law, Anisotropy, Pore pressure.
Identifiers: Two-layer soil, Soil columns.

A laboratory study of water moving steadily through an isothermal, two-layer soil is analyzed using Darcy's equation for unsaturated flow. Factors considered were thicknesses and kinds of topsoil and subsoil, depth of surface water ponding, magnitude of outflow water pressure, and soil-water history of the profile. Soil-water pressure distributions were measured at 5-cm depth intervals along the vertical columns. The unsaturated hydraulic conductivity was measured for sorption and desorption for each of 4 soils used as topsoil and subsoil in the two-layer columns. Values of hydraulic conductivity as a function of soil-water pressure were used to predict the measured soil-water pressure distributions and steady-state fluxes. The agreement between predicted and measured profiles is close. The necessity to distinguish between sorption and desorption, to obtain a uniform soil-bulk density distribution within each soil layer, and to ascertain the hydraulic conductivity as a function of soil-water pressure is discussed in relation to the predicted soil-water pressure distribution and flux values. INFLUENCE OF SAMPLE PRETREATMENT ON SOIL MOISTURE RETENTION,
Wisconsin Univ., Madison. Dept. of Soils.
D. E. Elrick, and C. B. Tanner.
Soil Science Society of America, Proceedings, Vol 19, No 3, p 279-282, 1955. 2 fig, 11 ref.

Descriptors: *Soil moisture, *Retention, Soil physics, Tensiometers, Moisture tension, Tension, Moisture content, Moisture availability, Soil texture, Wilting point, Sieve analysis, Puddling, Cores.
Identifiers: *Sample pretreatment.

Moisture retention was compared of 2-millimeter sieved, puddled, and undisturbed soil to determine whether approximate estimates of moisture retention values of undisturbed soil could be estimated by those for sieved soil. Soil samples were saturated with water and their moisture retention values determined at 11 moisture tension points with the range 0.01-15 atmospheres. Results showed that sieved soil can be used to indicate retention values of medium textured, undisturbed soil within the range of 1 to 15 atmospheres with a relative error of 10%. Below 1 atmosphere, retention values of sieved soil differed significantly from undisturbed soil ; thus, for retention values of less than 1.0 atmosphere, estimates should be made directly from undisturbed soil. It was noted that for tensions greater than 5.0 and less than 0.1 atmospheres, puddled soil provided a better estimate of retention values in undisturbed soil than did sieved soil. (Daniel-Wisconsin)

HYDROLOGIC PROPERTIES OF SOILS ON THREE SMALL WATERSHEDS IN THE WESTERN CASCADES OF OREGON,
Forest Service (USDA), Portland, Oreg. Pacific Northwest Forest and Range Experiment Station.
C. T. Dyrness.
USDA Forest Serv Res Note PNW-111, Sep 1969. 17 p.

Descriptors: *Soil water, *Soil surveys, *Percolation, *Storage capacity, *Soil stoniness, Soil classification, Soil porosity, Soil water movement, Wilting point, Field capacity, Moisture tension, Soil texture, Capillary water, Gravitational water, Experimental watersheds, Coniferous forests, Watershed management.

All soils mapped on three experimental watersheds were of loamy texture, and most showed minimal amounts of profile development. With one exception, rates of water movement through saturated soil cores were found to be very high. Percolation rates measured for surface horizons were unusually rapid due to the very porous and highly aggregated nature of these layers. Retention (capillary) and detention (gravitational) storage capacity values determined for the surface 4 feet of soil were extremely variable within individual soil series. The single most important factor causing variation was stone content of the soils. Each of the four most widespread soil series was divided into two new soil units on the basis of stone content. The resultant soil units had substantially reduced variation in water storage capacity values. Average retention storage capacity values for the surface 4 feet of soil ranged from approximately 6 to 14 inches, and average detention capacities varied from about 8 to 14 inches. Maximum storage capacity available at the end of the summer dry season is estimated to range from about 30 to 40 percent of the total retention capacity values for these soils.

SEASONAL CHANGES IN THE ATTACHED ALGAE OF FRESHWATER AND SALINE LAKES IN THE LOWER GRAND COULEE, WASHINGTON,
Oregon Univ., Eugene. Dept. of Biology.
Richard W. Castenholz.
Limnology and Oceanography, Vol V, No 1, p 1-28, Jan 1960. 10 fig, 6 tab, 38 ref.

Descriptors: *Algae, *Lakes, *Fresh water, *Saline lakes, *Washington, Alkaline water, Diatoms, Productivity, Conductivity, Hydrogen ion concentration, Dissolved solids, Sampling, Temperature, Ice, Ions, Chlorophyta, Cyanophyta, Primary productivity, Limnology.
Identifiers: *Seasonal effects, *Lower Grand Coulee (Wash), *Epilithic algae, *Epiphytic algae, Cymbella, Diatoma elongatum, Fragilaria vaucheriae, Gomphonema eriense, Nitzchia, Synedra, Epithemia, Rhopalodia gibba, Cladophora, Spirogyra, Oscillatoria, Chlorococcales, Ulothrix, Amphora, Production rate, Species composition, Glass plates, Species diversity, Depth effects, Comparative studies.

Investigations during a two year period of two freshwater alkaline lakes and two saline lakes in Lower Grand Coulee, Washington, have provided quantitative and qualitative records of seasonal changes in non-planktonic algae. Relative dominance was evaluated, based on the mathematical product of the cell count and a calculated volume factor for each species. In freshwater lakes, bimodal production curves, with the peak generally higher in spring than in fall, were evident. Lowest production occurred in late summer. Comparison of two years' results shows differences in total production at comparable times, but seasonal distribution of species was similar. In fresh water, diatom species, dominant in spring, were replaced by others in summer, which was also characterized by an abundance of Cladophora, Spirogyra, Oscillatoria, and members of the Chlorococcales. Dominant summer diatoms usually remained through autumn, and were then joined by several vernal species. In winter, diatom production was low, but Ulothrix clothed rocks in Falls Lake even under ice. Of 275 algal taxa from Lower Grand Coulee, 9% occurred in both fresh water and saline. (Jones-Wisconsin)

USE OF MODIFIED DIURNAL CURVES FOR THE MEASUREMENT OF METABOLISM IN STANDING WATER,
Toronto Univ. (Ontario). Dept. of Zoology.
Harold E. Welch.
Limnology and Oceanography, Vol 13, No 4, p 679-687, 1968. 6 fig, 1 tab, 31 ref.

Descriptors: *Biological communities, *Metabolism, *Methodology, *Photosynthetic oxygen, Oxygen, Photosynthesis, Ponds, Primary production, Georgia, Eutrophication, Carbon dioxide, Hydrogen ion concentration, Sampling.
Identifiers: *Community metabolism, *Diurnal oxygen curves, Winkler technique, Lago Pond (Ga).

A method is described for adapting, to limnetic situations, the estimation of community metabolism from diurnal variations in oxygen concentration of free water. Water samples were taken by vacuum, using polyethylene tubing fitted with baffles to aid in sampling thin layers. Samples, at intervals of 25 centimeters from surface to anaerobic layer (depth, 2.5 meters), were taken each hour to establish diurnal curve of oxygen concentrations, as determined by azide modification of Winkler technique. During course of a year, samples yielded values of corrected gross photosynthesis (in grams oxygen/square meter per day) varying between 2.2 (January) to 10.0 (June-August). This technique avoids disadvantages of bottle methods which are related to sharp chemical stratification of the water column, diurnal migration of algae, and production of gas bubbles. Procedure also minimizes ecosystem disturbance and lessens possible diffusion errors. Chief disadvantage is its dependance on significant volumetric changes in oxygen or carbon dioxide. Figures in the report include a schematic diagram of the sampling system, and representative oxygen and pH profiles of Lago Pond, a small, fertile Georgia farm impoundment. (Voigtlander-Wisconsin)

2I. Water in Plants

ATRIPLEX POLYCARPA: I. GERMINATION AND GROWTH AS AFFECTED BY SODIUM CHLORIDE IN WATER CULTURES,
California Univ., Riverside. Dept. of Agronomy.
N. Jerry Chatterton, and Cyrus M. McKell.
Agronomy Journal, Vol 61, No 3, May-June 1969, p 448-450. 1 tab, 2 fig, 11 ref.

Descriptors: *Salt tolerance, *Plant growth, *Germination, *Desert plants, *Saline soils, Grazing, Soil-water-plant relationships, Halophytes, Seeds, Osmosis, Forages, Sodium chloride, Root development, Growth stages.
Identifiers: *Desert saltbush.

Many of the arid regions of the world have a salinity problem. In this laboratory study the authors report effects of varying levels of sodium chloride on germination and growth of desert saltbush (Atriplex polycarpa)-- an evergreen shrub which offers potential as a forage plant in arid areas. Germination was severely reduced when seedlings were placed in solutions having osmotic potentials of -4.20 atmospheres. At -16.82 atmospheres there was essentially no germination. Growth of established seedlings under greenhouse conditions was reduced but not halted by salt concentrations as great as -24.00 atmospheres osmotic potential (39,000 ppm in solution). Greatest tolerance was shown by plants from a Bishop, California, population. Desert saltbush was found very tolerant to NaCl and was suggested as a good forage plant for supporting grazing in arid areas with high salinity. (Crouse-Arizona)

GRASS SEEDING IN THAL, WEST PAKISTAN,
Norman H. French.
Annals of Arid Zone, Vol 7, No 2, p 221-229, 1968. 2 tab.

Descriptors: *Vegetation regrowth, *Arid lands, *Range management, *Revegetation, *Weed control, *Costs, Range grasses, Economic feasibility, Cost-benefit ratio, Grazing, Forages, Seeds, Livestock, Sands.
Identifiers: *West Pakistan, Reseeding.

Average annual rainfall in the Thal area of West Pakistan ranges between five and eight inches. Such land is too arid to support cultivation, yet investigations showed that it had supported adequate grass for livestock production in the past. Serious overgrazing for possibly a century had changed the ecological complex and all but eliminated desirable species of grass. The problem was to find suitable species that could utilize available soil moisture to support livestock grazing. Research by the Central Arid Zone Research Institute, Jodhpur, India, had indicated certain suitable species. Trials in Thal developed proper methods for seeding and increasing forage from 200 to more than 1500 pounds per acre. Such an increase is apparently possible for millions of acres of similar area. Estimated costs and returns are given together with a guide for proper stocking to maintain forage production. Economic feasibility, however, depends on use of high quality, productive stock. MOISTURE CONDENSATION ON WINTER VEGETATION,
Arizona Univ., Tucson. Dept. of Agricultural Engineering.
K. R. Frost.
Progressive Agriculture in Arizona, Vol 19, No 2, p 20-22, Mar-Apr 1967. 3 p, 5 fig.

Descriptors: *Condensation, *Grasses, *Arizona, *Water yield improvement, *Dewpoint, Dew, Arid lands, Evapotranspiration, Lysimeters, Vegetation effects, Temperature, Moisture availability, Air temperature, Frost.

A study over a period of four winters in arid areas near Tucson, Arizona, showed that nighttime condensation on grasses and grain crops could make a meaningful contribution to the water supply of these crops. Measurements were made with an evapotranspirometer (weighing lysimeter). Part of the condensed moisture entered the soil and was available to the plant roots while part remained on the leaves where it helped reduce evapotranspiration losses during the following day. Analysis of the data showed that nighttime condensation depended on 1.) number of hours the ground level temperature was below dewpoint, (2) ground level air movement, and (3) surface area of the vegetation.

Maximum yield occurred when (1) surface temperature was below dewpoint all night, (2) grass was upright and variable in height, and (3) air movement was relatively low. (Crouse-Arizona)

Descriptors: *Diagenesis, *Water chemistry, *Sediments, Mineralogy, Chemical reactions, Laboratory tests, Geochemistry.
Identifiers: Graywackes, Hydrothermal alteration, Columbia River sediments.

Experiments with sands chemically similar to graywackes produced 'matrix' minerals at 250 deg C and a water pressure of 1 kilobar. Starting materials were moderately well sorted sands containing abundant volcanic rock fragments and no detectable clay minerals. The results support the concept that graywacke matrix may form diagenetically by hydration and recrystallization of unstable clasts. Matrix need not be a recrystallized detrial fine fraction. Texture, therefore, is not a reliable criterion for sandstone classification. For graywackes, chemical composition may be more significant. (Knapp-USGS)

Descriptors: *Carbonate rocks, *Sedimentation, *Lithification, *Atlantic Ocean, Marine geology, Sediment distribution, Stratification, Drill holes, Organic matter, Dating.
Identifiers: *Sediment orientation, *North Atlantic ocean, Nonlithified carbonates, Seamounts.

Differences between oriented indurated carbonate samples, obtained from the North Atlantic sea floor with deep-sea coring apparatus, are described. Two main types of lithology occur in the samples; one is mostly nonlithified layers of corals, gastropods, pelecypods, and foraminifera; the other is a lithified carbonate of hard layers, mostly globigerina-pteropod oozes with a few molluscan fragments, but sometimes lacking in organic constituents. Lithified and nonlithified couplets of sediments can be related in age and orientation as a result of the findings of the described study. Age determinations with carbon-14 show that adjacent layers of lithified and nonlithified carbonate sediments may differ in age by more than 30,000 years. (Lang-USGS)

SEDIMENTS OF THE ANDAMAN BASIN, NORTHEASTERN INDIAN OCEAN,
University of Southern California, Los Angeles. Dept. of Geological Sciences.
Kelvin S. Rodolfo.
Marine Geol, Vol 7, No 5, p 371-402, Oct 1969. 32 p, 15 fig, 1 tab, 43 ref. Grant Nos. GP-2530, GA-730, and GA-1072 NSF.

Descriptors: *Sedimentation, *Sedimentary basins (Geological), *Provenance, *Deposition (Sediments), *Sedimentation rates, Currents (Water), Climates, Sediment distribution, Sediment yield.
Identifiers: Bay of Bengal, Irrawaddy River.

The Andaman Basin is an area of 800,000 sq km separated from the Bay of Bengal by the Andaman-Nicobar Ridge. The basin's principal sediment source is the Irrawaddy River's annual load of about 265 million metric tons of silty clay. Climate and physiography trap most of this sediment in the basin; over 90% of Burmese rainfall, 80% of runoff and 87% of sediment discharge result from the southwest monsoon. Prevailing winds of this season drive westerly currents which displace the turbid Irrawaddy discharge eastward from the river's mouth. The eastern and inner Irrawaddy delta-shelf is accumulating 90% of this sediment at a rate of 200 cm/100 year. Contribution from the Irrawaddy constitutes 86% of the central trough's sediment, the difference being foraminiferal carbonate. Areal patterns of sediment parameters indicate that basinward transport of Irrawaddy sediment is controlled by bottom topography. Depositional rates average 15 cm/1,000 year in the central trough, which has a total fill of about 1.5 km. The beveled Malay continental margin and the absence of any other logical provenance for thick flysch-like Tertiary sediments in the Andaman-Nicobar Ridge suggest that the basin began to form in the Late Miocene as Malaya rifted away from the Andaman-Nicobar Ridge. GEOMORPHIC EFFECTS OF THE MAY 1967 FLOOD IN GRABURN WATERSHED, CYPRESS HILLS, ALBERTA, CANADA,
Queen's Univ., Kingston (Ontario); and Bishop's Univ., Lennoxville (Quebec).
J. J. McPherson, and W. F. Rannie.
J Hydrol, Vol 9, No 3, p 307-321, Nov 1969. 15 p, 9 fig, 2 tab, 18 ref.

Descriptors: *Floods, *Erosion, *Sediment yield, Flood plains, Sedimentation, Gravels, Sands, Silts, Clays, Geomorphology, Provenance, Hydrology, Climates, Bed load, Discharge (Water), Stream erosion.
Identifiers: *Canada, Alberta, Graburn watershed.

In May 1967, a flood which was at least a 50 year flood occurred in Graburn watershed in the Alberta Cypress Hills. During the 6 day flood period from May 16th to May 21st, 1,023 tons of sediment were removed in solution, 17,400 tons in suspension and 28,300 tons as bed load. An average thickness of 0.09 feet of fresh overbank material was deposited by the floodwaters. Gravel, as well as the more normal vertical accretion silt and clay material was laid down on the floodplain surface. Comparison of the rate of denudation calculated for the flood (0.0013 feet) with other reported rates, suggest that it is not as high as might be expected for a flood of this magnitude. (Knapp-USGS)
W70-01856

PRELIMINARY EXPERIMENTS ON HYDRODYNAMIC MOVEMENT INDUCED BY EVAPORATION AND THEIR BEARING ON THE DOLOMITE PROBLEM,
Eidgenoessische Technische Hochschule, Zurich (Switzerland).
K. Jinghwa Hsu, and Christoph Siegenthaler.
Sedimentology, Vol 12, No 1-2, p 11-25, Apr 1969. 15 p, 2 fig, 1 tab, 29 ref.

Descriptors: *Water chemistry, *Groundwater movement, *Diagenesis, *Dolomite, *Evaporation, Hydraulic gradient, Carbonates, Chemical precipitation, Sands, Silts, Permeability, Porosity, Water levels, Mineralogy, Flow rates, Hydraulic models, Model studies, Hydrodynamics.
Identifiers: *Dolomitization, Evaporative pumping.

Experiments were performed to demonstrate that saline interstitial waters under an arid coastal plain could be set in hydrodynamic movement to replace the evaporative loss near the surface. In contrast to movement in a vadose zone, which is related to capillary forces caused by surface tension, this movement is induced by a vertical hydraulic gradient under the evaporated area. Experiments further verified that flow rate induced by evaporative pumping was directly governed by evaporation alone; linear flow rate through coarse sand and that through very fine silt was approximately the same under the same evaporative condition. Yet the movement apparently obeyed Darcy's law. The gradient was much greater in relative impermeable silt than in permeable sand, as is required if the water to replace evaporative loss is to flow with the same rate through those media. Hydrodynamic movement induced by evaporation could be an effective mechanism to transport magnesium-bearing solutions through relatively impermeable sediments of an arid coastal plain. Dolomitization by evaporative pumping could proceed at a rate to account for the origin of Recent dolomite crusts, and for the great thickness of ancient supratidal dolomites. Dolomitization by seepage reflux or by groundwaters cannot be extensive, because of the inadequate magnesium-supply of such waters. (Knapp-USGS)

EARLY DIAGENETIC CEMENTATION OF RECENT SANDS, FRASER RIVER DELTA, BRITISH COLUMBIA,
British Columbia Univ., Vancouver. Dept. of Geology; and British Columbia Univ., Vancouver. Inst. of Oceanography.
R. E. Garrison, J. L. Luternauer, E. V. Grill, R. D. MacDonald, and J. W. Murray.
Sedimentology, Vol 12, No 1-2, p 27-46, Apr 1969. 20 p, 10 fig, 1 tab, 44 ref.

Descriptors: *Diagenesis, *Sediments, *Calcite, *Sands, *River beds, Groundwater movement, Sedimentation, Water chemistry, Deltas, Saline water intrusion, Sea water, Mineralogy, Calcium carbonate, Chemical precipitation.
Identifiers: British Columbia, Fraser River.

Modern terrigenous sediments cemented by low-magnesian calcite are found in distributary channels and adjacent shallow-water marine localities at the front of the Fraser River delta. These per-

manently submerged areas are usually covered by sea water, including sea water intruded upstream along bottoms of river channels. The cemented sediments occur as irregular to platy nodular masses at or near to sediment-water interface, where they are frequently encountered during dredging. The cement consists of small crystals arranged in fibrous rims and other aggregates around and between sand grains. Processes leading to cementation are not yet known, but may include dissolution of calcareous shells by pore waters in buried sediments, followed by precipitation of calcite at higher levels from these fluids as they are expelled upward during compaction. (Knapp-USGS)
W70-01861

RECENT LITTORAL AND SUBLITTORAL HIGH-Mg CALCITE LITHIFICATION IN THE MEDITERRANEAN,
Uppsala Univ. (Sweden). Dept. of Historical Geology and Paleontology.
Torbjorn Alexandersson.
Sedimentology, Vol 12, No 1-2, p 47-61, Apr 1969. 15 p, 6 fig, 2 plate, 31 ref.

Descriptors: *Diagenesis, *Mineralogy, *Water chemistry, *Lithification, Carbonates, Magnesium, Calcite, Dolomite, Coral, Algae, Reefs, Sediments, Bottom sediments.
Identifiers: Aragonite, Mediterranean.

Lithification caused by inorganic precipitation of high-Mg calcite is reported from several localities in the Mediterranean. A micritic calcite cement with 13-15 mol. % Mg carbonate in solid solution lithifies internal sediments and forms open-space fillings within a sublittoral algal framework in which the biogenic structures are gradually obliterated through the activity of numerous boring organisms and the subsequent precipitation of micrite. The silt-mud fraction of unconsolidated bottom sediments is to a large extent stable low-Mg calcite, and is not the source of the micrite; instead the cementing mineral is assumed to precipitate directly from interstitial sea water aided by organic activity. The same phase of high-Mg calcite also forms the cement in beachrock; the Mg-content is an original property and not the result of diagenetic changes. The cement occurs partly as micrite, identical to the micrite in the lithified algal framework, and partly as radiating microspar fringes. In the present marine environment high-Mg calcite may substitute for aragonite as the mineral form of precipitated calcium carbonate. (Knapp-USGS)

THE CHEMISTRY OF SUBMARINE CEMENT FORMATION AT DOHAT HUSSAIN IN THE PERSIAN GULF,
Koninklijke-Shell Exploratie en Produktie Laboratorium, Rijswijk (The Netherlands).
K. De Groot.
Sedimentology, Vol 12, No 1-2, p 63-68, Apr 1969. 6 p, 1 fig, 2 tab, 9 ref.

Descriptors: *Diagenesis, *Lithification, *Bottom sediments, *Water chemistry, Mud, Carbonates, Calcite, Dolomite, Aqueous solutions, Solubility, Chemical precipitation, Magnesium.
Identifiers: Aragonite, Pore water.

A chemical study made at Dohat Hussain lagoon in Qatar, has supported other field observations that submarine carbonate cementation is probably active today. The source of the cement is the lagoon water, supersaturated with aragonite. In the lagoon the supersaturation is too low to effect spontaneous nucleation and thus precipitation of carbonate, but just below the sediment-water interface both the presence of a stable substrate and supersaturation promote aragonite precipitation. In soft sediment layers in between cemented layers no supersaturation was found. (Knapp-USGS)

G. Evans, V. Schmidt, P. Bush, and H. Nelson.
Sedimentology, Vol 12, No 1-2, p 145-159, Apr 1969. 15 p, 5 fig, 1 plate, 3 tab, 18 ref.

Descriptors: *Chemical precipitation, *Evaporation, *Arid lands, *Mineralogy, Sediments, Gypsum, Anhydrite, Dolomite, Magnesium, Halides, Salts, Groundwater, Water chemistry, Water temperature, Water levels, Brines, Sea water, Salinity, Sands, Carbonate rocks.
Identifiers: *Persian Gulf, Sabkha, Abu Dhabi, Pore water.

The sabkha, an arid coastal plain of Abu Dhabi on the coast of the Persian Gulf, was formed during the past 7,000 years by wind erosion of pre-existing dunes and progradation of subaqueous, intertidal, and supratidal carbonate sediments. Marine transgression began in this area about 7,000 years ago and reached an apparent high about 1 m above its present level somewhat prior to 4,000 years B. P. Since then progradation of intertidal and supratidal sediments has taken place; this began 3,750 years ago. Arid conditions and evaporation on the sabkha have produced large amounts of gypsum and anhydrite and lesser amounts of dolomite, magnesite, celestite and halite. (Knapp-USGS)

RELATIONS OF JOINTING TO ORIENTATION OF SOLUTION CAVITIES IN LIMESTONES OF CENTRAL PENNSYLVANIA,
Geological Survey, Washington, D.C.
Ruth G. Deike.
Amer J Sci, Vol 267, No 10, p 1230-1248, Dec 1969. 19 p, 10 fig, 2 tab, 9 ref.

Descriptors: *Karst, *Pennsylvania, *Geologic control, Caves, Limestones, Solubility, Joints (Geology), Fractures (Geology), Groundwater movement, Geology, Permeability, Anisotropy, Hydrogeology, Structural geology, Folds (Geology), Geomorphology.
Identifiers: Cave orientation-jointing relations.

Twenty-six caves located in anticlinal, limestone-floored valleys of Central Pennsylvania were studied by division into passage segments inferred to have formed along the strike of fracture planes. Statistically preferred orientations of these segments were calculated. For each cave passage, an average passage orientation was calculated. Fractures measured at outcrops near the caves were classed by their preferred orientations. The average passage orientation compared with the orientation of fracture frequency was significant to the 95% level, and a plot of the relationship proved to be broadly linear. The most abundant fractures are vertical strike joints and steeply dipping bedding planes, and they lie parallel both to the anticlinal axes and down-valley water flow, suggesting increased solution along vertical joints. Individual cave patterns were found to reflect local fracture systems where: (1) linear caves develop along more steeply dipping and probably more closely spaced bedding planes; (2) several caves, particularly along flanks of folds, develop major passages along a set of the same subparallel fractures; (3) as the local structure changes the fracture orientation, the cave passages parallel the local fractures; (4) widely-spaced cave passages develop where intersecting fracture sets are also widely spaced. AN ANALYSIS OF SOME DATA FROM NATURAL ALLUVIAL CHANNELS,
Geological Survey, Tucson, Ariz.
George H. Caddie.
In: Geol Surv Res 1969, Prof Pap 650-C, p C188-C194, 1969. 7 p, 7 fig, 6 ref.

Descriptors: *Sediment transport, *Alluvial channels, *Friction, Sediment discharge, Sediment load, Colorado River, Statistical methods, Data collections, Sampling, Data processing, Discharge (Water).
Identifiers: Glen Canyon Dam.

Recent work on the geometry of stream channels has resulted in a hypothesis that the friction factor of any stream flowing in alluvium is virtually indeterminate because friction is the result of specific constraints placed upon the stream. The relationships between velocity, unit discharge, and slope for several locations on the Colorado River below Glen Canyon Dam are different from those of channels in which depth, velocity, and discharge all vary with changes in load and discharge. Apparently this is so because the stream is degrading its bed at these locations. Some natural streams, unaffected by manmade reservoirs, are shown to have the same characteristics. (Knapp-USGS)

A MUDFLOW IN THE SECOND CREEK DRAINAGE, LAKE TAHOE BASIN, NEVADA, AND ITS RELATION TO SEDIMENTATION AND URBANIZATION,
Geological Survey, Carson City, Nev.
Patrick A. Glancy.
In: Geol Surv Res 1969, Prof Pap 650-C, p C195-C200, 1969. 6 p, 7 fig, 1 tab, 2 ref.

Descriptors: *Mudflows, *Urbanization, *Sedimentation, *Nevada, Erosion, Soil erosion, Mass wasting, Channel morphology, Channel erosion, Floods, Deposition (Sediments).
Identifiers: Lake Tahoe Basin (Nev).

A mudflow of more than 50,000 cubic yards occurred in the 1.5-square-mile Second Creek basin on August 25, 1967, after an intense thundershower. Although the mudflow originated natu-

rally, its path was affected by manmade features. It damaged real estate and roadways in the lower part of the drainage, and also polluted Lake Tahoe. The mudflow probably is typical of one erosional process believed common throughout the area. The sequence includes sheet and rill erosion of non-forested uplands, severe downstream channel erosion that flushes out alluvium previously accumulated as a result of normal runoff and mass wasting, and extensive deposition along the flatter and lower part of the drainage. Estimates suggest that sheet and rill erosion of the upper basin contributed 60 to 80% of the debris, with the rest derived from the main channel. The event caused landscape denudation that averaged about 0.02 ft over the entire basin. Results of this reconnaissance influenced design of drainage structures for a new highway route through the area. (Knapp-USGS)

RELATIONSHIPS AMONG ADSORBED PHOSPHATE, SILICA, AND HYDROXYL DURING DRYING AND REWETTING OF KAOLINITE SUSPENSION,
National and Univ. Inst. of Agriculture, Rehovoth (Israel). Volcani Inst. of Agricultural Research; and Colorado State Univ., Fort Collins.
B. Bar-Yosef, U. Kafkafi, and N. Lahav.
Soil Sci Soc Amer Proc, Vol 33, No 5, p 672-677, Sept-Oct 1969. 6 p, 7 fig, 14 ref. Proj No A-2 (Ford Foundation).

Descriptors: *Adsorption, *Chemical reactions, *Phosphates, *Silica, *Drying, Wetting, Clay minerals, Aqueous solutions, Kaolinite, Acidity, Suspension.
Identifiers: Langmuir equation, Peerless kaolinite.

The effects of drying-wetting cycle of a kaolinite suspension on the relationships between phosphate, silica, and hydroxyl in solution were studied. As predicted by the Langmuir adsorption equation, the concentration of P in the equilibrium solution remained constant during the drying process; in contrast, the concentration of silica increased. A competition between phosphate and silica on adsorption sites was observed between pH 7 and pH 9. The amount of hydroxyls needed to desorb a given amount of phosphate was increased by oven drying the kaolinite in the presence of phosphate. (Carstea-USGS)

REACTIONS OF Ce IN SOLUTION AND SUSPENSIONS OF SOIL HUMIC ACID AND BENTONITE,
Ohio Agricultural Research and Development Center, Wooster; and Ohio State Univ., Columbus.
R. E. Brown, R. E. Franklin, and R. H. Miller.
Soil Sci Soc Amer Proc, Vol 33, No 5, p 677-681, Sept-Oct 1969. 5 p, 6 fig, 1 tab, 13 ref. Grant RH00124 PHS.

Descriptors: *Cesium, *Radioisotopes, *Cation exchange, *Chelation, *Humic acids, Clay minerals, Suspension, Aqueous solutions, Acidity, Bentonite, Hydrogen, Calcium, Potassium, Humic acids, Cation adsorption.
Identifiers: *Ionic strength, *Fission products, Radiocolloids.

The effects of pH, ionic strength of solutions and exchangeable cation on complex formation between Ce and soil colloids were studied in suspensions of humic acid, bentonite clay, and a mixture of these two colloids saturated with Ca or K and H. The equilibrium is shifted towards the radiocolloidal form of Ce as ionic strength and Ce concentration decrease and as pH increases. In the Ca-H saturated system, humic acid adsorbed much greater amounts of Ce than did dentonite. In the K-H saturated systems, similar amounts of Ce were adsorbed by both bentonite and humic acid. A more favorable orientation of the humic acid molecule for chelation of Ce explains the strong bonding of Ce by Ca-humic acid and humic acid-bentonite mixtures. (Carstea-USGS)
W70-01646

ADSORPTION OF NITRATE IN AMORPHOUS AND KAOLINITIC HAWAIIAN SOILS,
Hawaii Univ., Honolulu. Dept. of Soil Science.
B. R. Singh, and Y. Kanehiro.
Soil Sci Soc Amer Proc, Vol 33, No 5, p 681-683, Sept-Oct 1969. 3 p, 1 fig, 2 tab, 16 ref.

Descriptors: *Anion adsorption, *Nitrates, *Anion exchange, *Soil chemistry, Kaolinite, Clay minerals, Soils, Soil types, Sulfates, Chlorides, Water chemistry.
Identifiers: *Hawaiian soils, Akaka silty clay, Wahiawa silty clay, Amorphous soil materials.

The adsorption of nitrate in an amorphous Akaka silty clay and kaolinite Wahiawa silty clay increased consistently with increasing concentration and decreasing pH of the electrolyte solution. The magnitude of adsorption was higher in the Akaka than in the Wahiawa soil. The amount of adsorbed nitrate was notably more when sulfate rather than Cl was used as the replacing anion. It was deduced that while the concentration-dependent nitrate adsorption is due to electrostatic and van der Waal forces, the pH-dependent adsorption is largely due to electrostatic forces. The adsorption of nitrate followed the Freundlich type of isotherm. (Carstea-USGS)
W70-01647

SOLUBILITY OF CALCIUM CARBONATE PRECIPITATED IN AQUEOUS SOLUTIONS OF MAGNESIUM AND SULFATE SALTS,
California Univ., Riverside. Dept. of Soils and Plant Nutrition.
H. E. Doner, and P. F. Pratt.
Soil Sci Soc Amer Proc, Vol 33, No 5, p 690-693, Sept-Oct 1969. 4 p, 4 tab, 17 ref.

Descriptors: *Solubility, *Calcium carbonate, *Aqueous solutions, Water chemistry, Magnesium, Sulfates, Salts, Carbon dioxide, Sodium chloride, Magnesium compounds, Calcite, Analytical techniques, X-ray diffraction, Soils, Soil water.
Identifiers: Soil water chemistry.

Calcium carbonates were precipitated in the presence of various salts at controlled carbon dioxide partial pressures. Solubilities of the precipitates were compared with that of calcite and the precipitates were compared with that of calcite and the precipitates were subjected to X-ray diffraction for the detection of crystalline products and in some cases analyzed for coprecipitated Mg. In NaCl solutions, the solubility of the carbonate was that of calcite. In magnesium chloride solutions, the solubility of the precipitate was higher than that of calcite, both calcite and aragonite were detected and Mg was coprecipitated in the solid phase. In solutions of sodium sulfate, the solubility of the precipitate was higher than in the case of the magnesium chloride solutions and both calcite and vaterite were detected. In solutions of magnesium sulfate, the solubility of the precipitate was intermediate between that of the magnesium chloride solutions and the sodium sulfate solutions. The solubility product of calcium carbonate seemed to be related mainly to the nature of the solid phase. (Carstea-USGS)

STANDARD HEATS AND ENTROPIES OF EXCHANGE FOR ALKALI METAL CATIONS ON WYOMING BENTONITE,
UT-AEC Agricultural Research Lab., Oak Ridge, Tenn.; Louvain Univ. (Belgium). Inst. of Agronomy; and Fisk Univ., Nashville, Tenn.
R. G. Gast, Robert Van Bladel, and K. B. Deshpande.
Soil Sci Soc Amer Proc, Vol 33, No 5, p 661-664, Sept-Oct 1969. 4 p, 3 fig, 2 tab, 12 ref.

Descriptors: *Thermodynamics, *Heat, *Cation exchange, *Entropy, *Clay minerals, Bentonite, Sodium, Potassium, Selectivity, Enthalpy, Hydration.
Identifiers: *Ion hydration, *Clay-water systems, Standard heats, Standard entropy, Standard enthalpy.

Standard heats of exchange for alkali metal cation exchange on Wyoming bentonite were determined directly using a Calvet microcalorimeter and indirectly from the temperature dependence of equilibrium selectivity coefficients. Standard entropies of exchange were calculated by combining the standard heats with free energy values estimated from equilibrium selectivity coefficient determinations. While the entropy changes did contribute significantly to the standard free energies of exchange, they were only about 10% of the hydration entropy differences for Na-Li and Na-K exchange and 26 and 41% for Na-Rb and Na-Cs exchange, respectively. Both standard heat and standard free energy were always negative for uptake of the preferred cation, and absolute values increased with the degree of selectivity. (Carstea-USGS)
W70-01665

THEORETICAL CONSIDERATION OF THE CALCIUM SULFATE-BICARBONATE-CARBONATE INTERRELATION IN SOIL SOLUTION,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
F. S. Nakayama.
Soil Sci Soc Amer Proc, Vol 33, No 5, p 668-672, Sept-Oct 1969. 5 p, 5 fig, 2 tab, 13 ref.

Descriptors: *Thermodynamics, *Water chemistry, *Bicarbonates, *Carbonates, *Sulfates, Water quality, Aqueous solutions, Soil physical properties, Soil chemical properties, Gypsum, Reclamation, Soil water, Ions, Soil moisture, Acidity, Chemical potential.
Identifiers: *Ion-pairs distributions, Activity, Activity coefficients.

The probable distributions of the ion-pairs calcium-sulfate and calcium-carbonate and complex calcium bicarbonate ion in solution are discussed thermodynamically and graphically in terms of sulfate, carbonate, bicarbonate, and hydrogen ion activities. In alkali media where the carbonate form predominates, the calcium carbonate species will dominate the calcium sulfate and calcium bicarbonate forms, and is a significant part of the total calcium in solution. The complexed and undissociated forms of Ca represent a significant portion of the total Ca in solution at equilibrium. Reclamation projects involving the improvement of soil physical and chemical properties using gypsum and other Ca sources require an understanding of these relationships. (Carstea-USGS)

GEOCHEMISTRY OF IRON IN A COASTAL-PLAIN GROUND WATER OF THE CAMDEN, NEW JERSEY, AREA,
Geological Survey, Trenton, N.J.
Donald Langmuir.
In: Geol Surv Res 1969, Prof Pap 650-C, p C224-C235, 1969. 12 p, 6 fig, 4 tab, 34 ref.

Descriptors: *Geochemistry, *Iron, *Groundwater, *Coastal plains, *New Jersey, Aquifers, Groundwater movement, Water chemistry, Water quality, Ions, Thermodynamics, Mineralogy, Oxidation-reduction potential, Hydrogen ion concentration.
Identifiers: Camden (NJ), Groundwater chemistry.

In northern Camden and northwestern Burlington Counties, N.J., the pH of groundwater in the Potomac Group and the Raritan and Magothy Formations of Cretaceous age ranges from 5-6 in the outcrop area to 8 several miles downdip to the southeast. Iron is present in the groundwater as dissolved Fe (2) ion and FeOH ion, and as suspended ferric oxyhydroxides, presumably formed by oxidation of ferrous species already in solution. The oxyhydroxides are probably a mixture of amorphous material and goethite with small amounts of hematite. In the outcrop area the concentration of dissolved ferrous or suspended ferric species is less than 0.5 milligrams per liter in unpolluted waters. Just downdip from the outcrop area, ferrous and ferric iron species increase abruptly to about 6-7 mg/l and 6-11 mg/l, respectively. Farther downdip at pH above 6.5, both forms of iron decrease gradually to less than 0.5 mg/l. The decrease in ferrous species is not due to siderite precipitation, but may reflect an increase in the stability of suspended amorphous material owing to aging, coupled with adsorption of ferrous iron by the oxyhydroxides and partial conversion of the amorphous phase to goethite. The decrease in suspended ferric species is probably caused by cation absorption, aging, coagulation, and settling. (Knapp-USGS)

HOLOCENE INTERTIDAL CALCIUM CARBONATE CEMENTATION, QATAR, PERSIAN GULF,
Illing (V. C.) and Partners, Cheam (England).
J. C. M. Taylor, and L. V. Illing.
Sedimentology, Vol 12, No 1-2, p 69-107, Apr 1969. 39 p, 2 fig, 6 plate, 2 tab, 42 ref.

Descriptors: *Lithification, *Diagenesis, *Carbonate rocks, *Bottom sediments, Chemical precipitation, Water chemistry, Sea water, Carbonates, Calcite, Dolomite, Magnesium, Mineralogy, Petrology.
Identifiers: *Persian Gulf, Qatar, Aragonite.

Cemented layers in the shallow lagoonal, intertidal, and supratidal sediments surrounding the Qatar Peninsula, Persian Gulf, contain high-magnesian calcite and aragonite cements. The magnesian calcite appears to occur both as a primary precipitate and as a replacement of aragonite. These cements are believed to be forming today from sea-derived waters. Radiocarbon dating sets an upper age limit of about 4,500 years. Two major types of cemented layer can be distinguished: beachrocks form variably cemented units about 1 m thick at the surface of freely draining exposed beaches; cemented sheets a few cm thick form beneath the surface of broad intertidal sand flats by the growth, hardening, and coalescence of small friable lumps near low-tide level. Replacement of aragonite matrix, druse, and pellets by microcrystalline magnesian calcite is accomplished

by dissolution and reprecipitation; detail is obliterated but the gross features of the original fabric are preserved. The process helps to explain the crystal fabrics of many older limestones. (Knapp-USGS)

SUBMARINE LITHIFICATION OF HOLOCENE CARBONATE SEDIMENTS IN THE PERSIAN GULF,
Koninklijke-Shell Exploratie en Produktie Laboratorium, Rijswijk (The Netherlands).
Eugene A. Shinn.
Sedimentology, Vol 12, No 1-2, p 109-144, Apr 1969. 36 p, 36 fig, 2 tab, 16 ref.

Descriptors: *Lithification, *Diagenesis, *Carbonate rocks, *Bottom sediments, Chemical precipitation, Water chemistry, Sea water, Sands, Carbonates, Calcite, Dolomite, Magnesium, Mineralogy, Petrology.
Identifiers: *Persian Gulf, Aragonite, Pore water.

Large areas of the sea floor in the Persian Gulf are composed of lithified carbonate sediment. That this cementation is contemporaneous and occurs within the present submarine environment has been proven by carbon dating, the presence of pottery and other artifacts within the lithified sediments, and other methods. Although the chemistry of the processes resulting in lithification is unknown it would seem not to require any special conditions other than carbonate-saturated sea water. The process seems to be operating in areas of relatively normal salinity and temperatures in depths ranging down to 30 m. It is deduced that the principal physical factors involved are relatively low rates of sedimentation, sediment stability, and high initial permeability of the sediments. The principal types of cement filling the intergranular spaces and locally replacing grains are aragonite (in several growth forms) and microcrystalline magnesium calcite. The aragonite cement seems to be unstable and has inverted locally to more stable calcite within the marine environment. Lithification results indirectly in the production of several other features all of which in the past have been regarded as criteria for unconformity. (Knapp-USGS)

GRAVELS OF THE SOUTHERN NORTH SEA,
Geological Inst., Groningen (Netherlands).
H. J. Veenstra.
Marine Geol, Vol 7, No. 5, p 449-464, Oct 1969. 16 p, 10 fig, 16 ref.

Descriptors: *Gravels, *Glacial drift, *Provenance, Sedimentation, Sampling, Mineralogy, Sediment transport, Pleistocene epoch.
Identifiers: *North Sea.

Gravels of six regions in the North Sea show differences in composition, grain size and roundness. The gravels in the Hinder Bank and Thames estuary regions represent reworked river deposits. The material near the Suffolk coast is better rounded and is a fossil beach gravel. These deposits were formed between Lower Tertiary and Lower Holocene. The gravel belt off the British coast contains many components that are not derived from rocks in the immediate surroundings. The gravels in the region of the Dogger Bank and Inner Well Bank Rough show analogous compositions pointing to a glacial origin. The gravel of the Dogger Bank was brought from the west by the land-ice of the Last Glacial. The gravel of the Cleaver Bank, east of the Dogger Bank, shows much flint of Scandinavian origin. The gravel of the Texel Rough is of Scandinavian origin, but here the moraines belong to the Saale (Penultimate) Glacial. Generally, the coarsest material is found on top of the elevations in the central North Sea, whereas more and finer gravel occurs in the deeper surroundings, thus indicating selection by waves during the low sea levels of the Lower Holocene. (Knapp-USGS)

THE ORIGIN OF HOLOCENE SHELL DEPOSITS IN THE CHENIER PLAIN FACIES OF ESSEX (GREAT BRITAIN),
Queen Mary Coll., London (England).
J. T. Greensmith, and E. V. Tucker.
Marine Geol, Vol 7, No 5, p 403-425, Oct 1969. 23 p, 11 fig, 38 ref.

Descriptors: *Sedimentation, *Shellfish, Sands, Currents (Water), Waves (Water), Sediment transport, Provenance, Aggradation, Erosion, Marine geology, Movement, Reefs, Sediment distribution.
Identifiers: *Cheniers, *Great Britain, Essex.

The chenier plain facies, extending 20 km northwards from the mouth of the Thames estuary, includes shell concentrations in the form of offshore banks and sheets with a maximum relief of 4 m, marsh edge sheets and ridges (cheniers) of lower relief, and shallow channel and pocket fills. Older inland shell deposits occupying the top 4m of a narrow 0.1-1 km wide zone running slightly oblique to the present coastline are predominantly degraded cheniers. They do not exhibit marked topographic relief. The modern cheniers are asymmetric bodies, crudely layered and crossbedded but devoid of imbricate structure. They are very mobile and migrate during storm periods across the salt marshes. The bulk of the shells are derived from living communities near low water mark and from sub-littoral communities, particularly those living in adjacent estuary channels. The history of the modern shell deposits since 1946 shows that their growth is largely dependent on two factors, mass mortality in the channel communities and the reworking of pre-existing shell sheets interbedded with mud-silt and fine sand of the intertidal zone. Sheets exposed at the salt marsh edge are important contributors at the present time. Growth is more pronounced during regional phases of tidal flat erosion. (Knapp-USGS)

A STUDY OF THE PHYSICAL HYDROGRAPHY OF THE PATUXENT RIVER AND ITS ESTUARY,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
Wadsworth Owen.
Res partly sponsored by Univ of Maryland, Natur Resources Inst. Chesapeake Bay Inst Tech Rep No 53, Johns Hopkins Univ, Apr 1969. 78 p, 26 fig, 2 tab, 20 ref, 2 append. Proj No NR 083-016, Contract Nos Nonr 248 (20) and Nonr 4010 (11), (Office of Naval Research).

Descriptors: *Hydrography, *Estuaries, *Rivers, *Maryland, *Stratified flow, Stratification, Salinity, Saline water intrusion, Water quality, Tidal effects, Water circulation, Streamflow, Dissolved oxygen, Hydrogen ion concentration.
Identifiers: Patuxent Estuary.

The Patuxent River, which has the largest drainage basin in the State of Maryland, is an estuary tributary to the Chesapeake Bay which itself is an estuary. A distinguishing feature of the Patuxent Estuary is its intermittent transition from a two-layer flow system to a three-layer flow system, a transition which occurs most often in the month of April. The data, for the most part, reveal the seasonal trends common to the other estuaries tributary to the Chesapeake Bay. The salinity is highest in the autumn months and lowest in the spring during the month of April. The water temperature follows the seasonal trends in the air temperature as might be expected for an estuary in a temperature climate. It seems reasonably certain that the three-layered flow which exists intermittently in the Patuxent is caused by a phase difference in fresh water inputs from the Susquehanna and from the Patuxent. MODEL SIMULATION OF SALINITY INTRUSION IN TIDAL ESTUARIES,
University of Strathclyde, Glasgow (Scotland).
D. I. H. Barr.
The Engineer, Vol 216, p 885-893, Nov 29, 1963. 6 fig, 1 tab, 31 ref.

Descriptors: *Model studies, *Estuaries, *Tides, *Saline water intrusion, Froude number, Reynolds number, Thermal pollution.

The purpose of this study is to explain certain aspects of model simulation of natural phenomena. One of the aspects studied was the exaggeration of the vertical scale and why it is a theoretical as well as a practical necessity. Then, consideration was given the further complication involved when simulation of salinity intrusion is required in tidal models. Because there is a link between all model experiments involving extended gravitational flow - free surface or internal and steady state or non-steady state - and it is proposed that the most appropriate parameters for the correlation and comparison of results from differing examples of such studies are the Froude-Reynolds number and the densimetric Froude-Reynolds number. Some conclusions were: (a) The congruency diagram method of scaling for heat dissipation models is essentially a facet of the whole problem of the scaling of free surface models where head loss is important. (b) Need of the exaggeration of the vertical scale in extension models is fundamental. Exaggeration will always cause some distortion; the well-mixed type of intrusion is in many ways more amenable to the model study approach than the power-station heat dissipation problem. (Guerrero-Vanderbilt)

AMINO ACID LEVELS IN THE ARGENTINE BASIN SEDIMENTS: CORRELATION WITH QUATERNARY CLIMATIC CHANGES,
Illinois Univ., Urbana.
F. J. Stevenson, and C-N Cheng.
Journal of Sedimentary Petrology, Vol 39, No 1, p 345-349, 1969. 3 fig, 1 tab, 17 ref.

Descriptors: *Amino acids, *Sediments, *Quaternary period, Pleistocene epoch, Marine geology, Distribution patterns, Nitrogen compounds, Nitrogen cycle, Geochemistry, Cores, Soil chemistry.
Identifiers: *Argentine Basin, *Climatic changes, Pleistocene glaciation, Marine sediments, Chemical processes.

Studies of three cores of Argentine Basin sediments, approximately 850 to 1200 centimers in length, taken from 640 to 920 nautical miles offshore, showed a close correlation between variations in the depth distribution of amino acids (100-400 micrograms amino acid nitrogen/gram sediment) and climatic fluctuations resulting from Pleistocene glaciation. Except for the top layers, which are presumed not to have attained equilibrium levels, zones of highest amino acid accumulation corresponded to sedimentary material deposited during periods of maximum ice accumulation on the continents. The appearance of corresponding amino acid layers at shallower depths in sediments further away from the mainland is said to be due to slower sedimentation rates with increasing distance from the shore. Further explanations of the observed patterns are offered. (Browman-Wisconsin)

03. WATER SUPPLY AUGMENTATION AND CONSERVATION

EFFECT OF SOIL MOISTURE REGIME AND ROW SPACING ON GRAIN SORGHUM PRODUCTION,
National and Univ. Inst. of Agriculture, Rehovoth (Israel). Volcani Inst. of Agriculture Research.
Z. Plaut, A. Blum, and I. Arnon.
Agronomy Journal, Vol 61, No 3, p 344-347, May-June 1969. 2 tab, 3 fig.

Descriptors: *Irrigation practices, *Semiarid climates, *Water conservation, *Sorghum, *Evapotranspiration, Crop production, Soil-water-plant relationships, Soil moisture, Crop response, Grains (Crops), Irrigation efficiency, Leaves, Moisture availability, Rates of application, Timing.
Identifiers: *Israel, Leaf area duration, Row spacing.

Grain sorghum is widely grown in arid and semiarid climates using irrigation agriculture. The authors of this article conducted an experiment using different irrigation regimes on grain sorghum production in semiarid central Israel. With heavier irrigation rates total evapotranspiration almost doubled, from 270 mm. to 530 mm. Total dry matter increased linearly with increased water use. However, a sigmoid relationship was found between grain yield and total evapotranspiration, indicating a decreasing rate if productivity when water was applied beyond a certain rate. The greatest water efficiency was with two irrigations to field capacity when the second was delayed until the milk stage of the crop. Changes in row spacing had little effect on yield. ELECTROSORPTION AND DESORPTION PROCESS FOR DEMINERALIZATION,
Southern Research Inst., Birmingham, Ala.
Robert E. Lacey.
Avail from Superintendent of Doc, US Government Printing Office, Wash DC, 20402 - Price $1.25 per copy. Office of Saline Water Res and Develop Progr Rep No 398, 1969. 117 p, 29 fig, 14 tab, 2 append. Contract No 14-01-0001-975 OSW.

Descriptors: *Desalination, *Desalination processes, *Adsorption, *Demineralization, *Membrane processes, Electrodialysis, Membranes, Brackish water, Water quality, Analytical techniques, Cost analysis, Cost comparisons.
Identifiers: *Electrosorption, *Desorption, Electrosorption membranes.

An improved design for electrosorption stacks, and methods of making acceptable electrosorption membranes have been developed. Operating characteristics of the improved electrosorption stack were determined in laboratory experiments and then the stack was used in the field to demineralize two types of natural brackish waters. The field evaluation unit was operated 24 hours a day for periods up to 54 days to determine the best operating conditions to be used with these natural waters. Electrodialysis experiments were conducted with the same waters. The data from the long-term evaluations of demineralization performance were used for estimating the cost of demineralizing these two waters by electrosorption and by electrodialysis. The cost estimates indicated the cost of demineralization by electrosorption would be lower than that for demineralization by electrodialysis by about 17% for one of the waters and about 6% for the other. HYDRODYNAMIC STUDIES FOR ELECTRODIALYSIS,
McDonnell Douglas Astronautics Co., Newport Beach, Calif.
G. Belfort, and G. A. Guter.
Avail from Superintendent of Doc, US Government Printing Office, Wash, DC, 20402 - Price $1.25 per copy. Office of Saline Water Res and Develop Progr Rep No 459, July 1969. 144 p, 87 fig, 15 tab, 14 ref. Contract No 14-01-0001-1313 OSW.

Descriptors: *Hydrodynamics, *Electrodialysis, *Desalination processes, Photography, Membranes, Brines, Ion exchange, Porosity, Flow, Electrical resistance, Screens, Head loss.
Identifiers: *Spacer screens, Drag coefficient.

The hydrodynamic effectiveness of various spacer screens for electrodialysis was studied with the aid of a novel photographic technique in which exposed photographic paper was used in the place of ion-selective membranes, and photographic developer was used in the place of brine. This technique produced a visual record of the membrane-solution interfacial flow patterns in electrodialysis cells. Additional tests were conducted on each screen with respect to porosity, dead flow area, drag coefficient, and influence on electrial resistance. Some screens are considerably more effective than others in improving electrodialysis performance, especially at flow rates that give Reynolds numbers greater than 180. Seven (out of 21) of the more promising screens were further evaluated in electrodialysis batch tests to determine how current efficiency, membrane stack pressure drop, and total power requirements vary with flow rate. Two new materials, not previously used in commercial electrodialysis equipment are recommended for further study. (Carstea-USGS)
W70-01672

CHEMICALS FROM SEA WATER BRINES,
Office of Saline Water, Washington, D.C.
Lee Leiserson, and Paul C. Scott.
Avail from Superintendent of Doc, US Government Printing Office, Wash, DC, 20402 - Price $0.35 per copy. Office of Saline Water Res and Develop Progr Rep No 445, Aug 1969. 25 p, 5 tab, 29 ref.

Descriptors: *Sea water, *Desalination, Sodium chloride, Economics, Research and development, Saline water, Disposal, Elements (Chemical), Brackish water, Brine disposal.
Identifiers: *Mineral recovery.

The methods of recovery of chemicals from desalting plant effluents are reviewed. The production of saturated brine, sodium chloride, and other minerals from brine effluents can be of economical importance under appropriate conditions. The production requires relatively simple technology. Areas needing more research in economical recovery are outlined. (Carstea-USGS)

THE USE OF AMALGAM ELECTRODES TO MEASURE ACTIVITY COEFFICIENTS OF METAL SALTS IN MULTICOMPONENT SALT SOLUTIONS,
Tyco Labs., Inc., Waltham, Mass.
James N. Butler.
Avail from Superintendent of Doc, US Government Printing Office, Wash DC, 20402 - Price $1.50 per copy. Office of Saline Water Res and Develop Progr Rep No 388, Oct 1968. 175 p, 40 fig, 18 tab, 133 ref. Contract No 14-01-0001-607 OSW.

Descriptors: *Electrodes, *Thermodynamics, *Reverse osmosis, *Desalination processes, Electrodialysis, Potassium, Calcium, Adsorption, Solvent extractions, Ion exchange.
Identifiers: *Amalgam electrodes, *Activity, Activity coefficients, Alkali metal electrode, Glass electrode, Electrosorption, Irreversible thermodynamics, Lithium.

The theory of irreversible thermodynamics is used to show the importance of activity as opposed to concentration in the electrodialysis and reverse osmosis processes in desalination. The discussion includes: (1) activity coefficient measurements in the aqueous multicomponent systems NaCl-Na sulfate, NaCl-LiCl; (2) thermodynamics and kinetics of the alkali metal amalgam electrode; (3) interference by a second cation such as potassium or lithium; (4) measurements of the standard potential of the lithium amalgam electrode; (5) the alkaline earth amalgam electrodes, particularly calcium and barium; and (6) techniques for handling amalgam electrodes, chloride and sulfate-reversible reference electrodes, glass electrodes and liquid ion exchange electrodes. The activity of individual components is important in solvent extraction, adsorption, electrosorption and scale formation. Activity measurements using a calcium-sensitive specific ion electrode are reported, and the theory of the activity of calcium ion in multicomponent solutions is discussed. A possible method based on the Bronsted theory for prediction of activity coefficients in multicomponent mixtures is presented. Experimental studies of the calcium amalgam and barium amalgam electrodes are summarized. (Carstea-USGS)

Descriptors: *Desalination processes, *Pilot plants, *Hydrates, *Sea water, *North Carolina, Desalination, Hydration, Brines, Filtration, Heat exchan-

gers, Instrumentation, Condensation, Research and development.
Identifiers: *Koppers hydrate process, Research and Development Test Station, Wrightsville Beach (NC).

This report summarizes the operational program conducted on the Koppers hydrate process at the Research and Development Test Station at Wrightsville Beach, North Carolina. The process studied consists of: (1) formation of gaseous hydrate in sea water; (2) brine removal from hydrate by filtration and washing; (3) decomposition by direct contact with condensing hydrating agent vapor, and (4) heat exchange with sea water. The hydrate process is technically feasible as shown by the fact that the 10,000 gpd plant operated without shutdown for 28 consecutive days. Production was approximately 300 gpd resulting in a product water of 101 ppm minimum salinity. Downtime was caused mainly by mechanical failures, lack of instrumentation, lack of control, and inadequate processing equipment. The hydrate pilot plant can be improved, and means of improvement are discussed. (Carstea-USGS)

CONCEPTUAL DESIGN STUDY OF A 50 MILLION GALLON PER DAY MSF DESALINATION PLANT AND TEST MODULE.
Fluor Cor., Ltd. Los Angeles, Calif.

OSW R and D Progr Rept No 233, Nov 1966. 97 p, 24 fig, 24 ref.
Identifiers: *Conceptual designs, *Flowsheets, *Multistage flash distillation, Capitalized costs, Construction costs, Cost breakdowns, Design, Layout, Plant layout, 0-50 MGD plant.

The purpose of the work is the development of a test module conceptual design from which architect-engineer plans and specifications may be prepared for procurement and construction. The evaporator unit described employs the conventional multistage flash process. The plant consists of 39 stages, 36 recovery stages and 3 rejection stages, and operates with a maximum brine temperature of 250 deg F. Blowdown brine concentration ratio is 2.0. Concentration ratio of the brine circulated through the brine heater is 1.7. Design capacity is 50 mgd of potable water at 78 deg F. The test module width was influenced by the desire to be able to demonstrate in the module the same size brine circulation pump as selected for the 50 mgd design. Considering all factors led to the use of a 1/4 width test module.

AN ASSESSMENT OF VAPOR COMPRESSION DISTILLATION,
California Univ., Richmond.
B. W. Tleimat, E. D. Howe, and A. D. K. Laird.
Desalination 2, p 287-98, 1967. 12 fig, 6 ref.
Identifiers: *Compressors, *Vapor compression evaporation, *Vapor compressors, Bench scale, Component designs, Design data, Distillation processes, Falling film evaporation.

A description of tests and data are presented concerning vapor compression distillation. It is shown that the compression energy requirement for the vapor-compression cycle may be predicted from the isentropic compression work requirement. The compressor energy is a function of M (the circulation ratio, lbs brine/lbs product), and decreases with increasing M. The isentropic compression work is higher for a finite M than that required by the conventional compression cycle. Methods are presented for estimating the effects of salinity and other factors on compressor power requirements.

THE CHARACTERISTICS OF DUAL PROCESS DISTILLATION PLANT COMBINING VAPOUR COMPRESSION AND MULTI-STAGE FLASH EVAPORATORS,
Atomic Energy Research Establishment, Winfrith (England).
F. C. Wood, and R. Herbert.
Preprint of Paper SM-113/44 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 23 p, 7 fig, 6 ref.
Identifiers: *Coupling (Reactor-desalting plant), *Dual-purpose plant, *Multistage flash distillation, *Vapor compression evaporation, Evaporators, Flash evaporation, Flowsheets, Heat exchangers, Heat transfer surfaces, Multiple effect distillation, Single-purpose plant, Thermodynamics, Turbines, Water costs estimate.

The relationship of energy demands and heat transfer surface for the vapor compression process are examined from the thermodynamic standpoint and compared with those of other evaporation processes. It is concluded that the greatest advantage in terms of heat transfer surface per unit of prime fuel is obtained when the vapor compression evaporator is coupled to the top end of the multistage flash plant either in single- or multi-effect. Various alternative coupling modes are considered, including the use of a secondary fluid in the vapor compression work cycle. Relative outputs of vapor compression and multistage evaporators depend primarily upon the type of heat source available and the efficiencies of the heat and work cycles. Typical figures are presented for various combinations using boilers/steam turbines, gas turbines, diesels and jet compressors. The principal secondary variables are operating temperature differences across the two kinds of evaporators. Power-to-water ratio may be increased economically by using a portion of the energy produced at the steam turbine to drive the vapor compression evaporator. The influence of the choice of principal variables, including turbine pass-out pressure, upon operating costs is illustrated for a nominal 300 mw (e) advanced gas cooled reactor operating in dual- and single-purpose modes.

SOME BASIC ASPECTS OF THE FLASH DISTILLATION PROCESS,
Heriot-Watt Univ., Edinburgh (Scotland).
A. N. Dickson, and J. K. Bradie.
Preprint of Paper SM-113/46 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1969. 18 p, 9 fig, 26 ref.
Identifiers: *Demisters, *Multistage flash distillation, *Two-phase flow, Entrainment, Evaporators, Experimental data, *Flash evaporation, Fluid flow, Hydraulic structures, Research results.

A report on MSF research at Heriot-Watt University. Part I discusses the problem of entrainment of water droplets in vapor streams and their removal by wire mesh type demisters. Methods of measuring droplet size-frequency spectra are given together with typical spectra obtained from an air-water analogue of pool boiling. Mesh demister performance is analyzed and collection efficiency of a wire discussed. Experimental measurements of dry pressure drop through demisters are given and a correlation derived from a simple physical model is suggested. The physical model is developed to provide a correlation between liquid and vapor flow rates at the point where flooding of the demister occurs, and this is compared with experimental results. Some discussion of wet pressure drop is also given. Part II presents experimental and analytical results of two-phase flashing flow in pipes and channels. The analysis is based upon a finite rate of vaporization model, which does not assume that thermodynamic equilibrium obtains, and allowance is made for variable vapor/liquid velocity ratios. Consideration is restricted to the two-phase flow regime in which the vapor is dispersed as bubbles throughout the liquid. The phenomenon of hydraulic jump in two-phase channel flow is discussed and both experimental and analytical results are given.

EXERGY LOSSES IN A FLASH EVAPORATOR,
Technische Hogeschool, Delft (Netherlands).
L. W. Koot.
Desalination 5, p 331-48, 1968. 8 fig, 7 ref.
Identifiers: *Multistage flash distillation, *Thermodynamic analysis, Distillation processes, Flash evaporation, Heat loss, Thermodynamics.

A thermodynamic explanation of the operation of a flash evaporator by the principle of exergy losses is of considerable importance, especially in the study of the desalination process. In a flash evaporator an amount of circulating heat to which additional energy is supplied is subjected to the irreversibilities of the installation. A calculation of the losses of exergy and measures of these irreversibilities, give information about the process details which are mainly responsible for the energy consumption. Assuming some simplifications, the numerical values of the loss of exergy are calculated for the special case of a ten stage once-through flash evaporator. It is found that the dominant losses are caused by the irreversibilities of the heat transfer from steam to brine and by the isenthalpic expansion of the brine between the flash chambers. Significant to cost reduction may be the need to supersede the flashing process by one involving less entropy production. This may be accomplished by (1) reducing losses in the water-steam separator, (2) restricting pumping power, (3) economical removal of incondensables.

UNITED KINGDOM DESALINATION RESEARCH AND DEVELOPMENT PROGRAM,
United Kingdom Atomic Energy Authority, Risley (England).
H. Kronberger.
Preprint of Paper SM-113/50 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 6 p.
Identifiers: *Development, Distillation processes, Freeze processes, Membrane processes, Multistage flash distillation, *Research, *Reviews.

In 1965 the Ukaea, on behalf of the UK government, assumed responsibility for research into development of methods of desalination of salt water. An initial three-year program costing $3 million brought close collaboration with industry on

processes including multistage flash distillation, electrodialysis, the secondary refrigerant processes and reverse osmosis. The program had two principal objectives - (1) to exploit the development potential of the multistage flash distillation process, and (2) to explore alternative methods of desalination which might supersede msf in the long term. In 1968 approval was given for expenditure of a further $9.6 million for the period 1968-71. Almost half of this will be used to finance agreed programs of work by the AEA with industrial collaborators. Project organization and current and proposed areas of research and development are outlined.

THE PHYSICS OF DESALINATION BY MULTI-STAGE FLASH DISTILLATION,
Glasgow Univ. (Scotland).
R. S. Silver.
J Brit Nucl Energy Soc 7 (1), p 36-42, 1968.
Identifiers: *Evaporator system design, *Physical properties, *Research, Bubble dynamics, Dynamic characteristics, Economic evaluations, Flash evaporation, Fluid dynamics, Performance ratio, Reviews, Stability analysis, Thermal properties, Vapor release rate, Water costs estimate.

The decision to utilize seawater conversion plants is based on economics. The costs involved are determined largely by knowledge of the related physical phenomena and by implementation of this knowledge. A review is presented of the major physical aspects and their interaction with plant design and cost. These aspects include bubble nucleation and growth, droplet formation, flashing temperature ranges, residence time, system stability and control, equilibrium time, and evaporation rate as related to thermal conductivity.

Identifiers: *Multistage flash distillation, *Parametric studies, *Thermodynamics, Brine concentration ratio, Design criteria, Distillation processes, Economic evaluations, Energy costs, Flash evaporation, Performance ratio, Thermodynamic analysis.

Principal optimization variables considered are number of stages, terminal temperature difference, performance ratio and concentration ratio. Interrelations between optimization variables are formulated by reference to interaction between thermodynamics and economics. A new concept of minimum-possible energy requirement is introduced, making it possible to account for the effect of brine concentration on amount of energy required and leading to a more accurate method of determining optimum concentration ratio. Thermal driving force function, providing a convenient interrelation between energy and surface requirements, is defined. The theory uses relative values of economic parameters rather than absolute values and, while current theories take economic parameters as constants, the proposed theory imposes no such restriction. As a result of its application, plots are furnished which can readily be used to determine optimum operating conditions represented in the concentration ratio, as well as design features such as number of stages, heating surface and energy requirement at optimum conditions.

Identifiers: *Evaporator system design, *Evaporator-condenser system designs, *Vertical tube evaporators, Design, Distillation processes, Economic evaluations, Plant layout, Surface boiling.

An analytical method is developed for determining the optimal number of stages in desalination plants with surface-type evaporators. The method utilizes as input data on water and stream properties, operating temperatures and flow rates, condenser surface areas and performance factors, on stream time fraction, heat input, and costs of capital equipment, energy, amortization, labor, and maintenance.

A summary of the trend evident in flash distillation plant development and against that background a discussion of the potential of competitive or alternative processes, particularly freezing, reverse osmosis, and electrodialysis both in the UK and overseas. At present flash distillation is in a commanding position, but there are reasons for believing that other processes are capable of development to the point where they will replace distillation in many circumstances.

THE NEED FOR DESALINATION,
Water Research Association, Medmenham (England).
R. G. Allen.
J Brit Nucl Energy Soc 7 (1), p 21-26, 1968. 4 fig, 5 ref.
Identifiers: *Multistage flash distillation, *Reviews, *Water utilization, Base-load, Distillation processes, Water sources, Water storage.

Desalination is in the early stages of its development as a water resource. It is already making its contribution as a straight addition to the water supply in cases where there is an absolute water deficiency, and it is now coming into use in areas where further conventional water supplies would be expensive, as the most economical supplement to existing systems. In the United Kingdom desalination as a base-load resource is considered unlikely before 1990, but its earlier application for peak load operation is expected. The world demand for desalination plants is thus expanding rapidly. The most successful process for seawater conversion remains multistage flash distillation, judged on both technical and economic grounds, and this advantage is likely to be retained for some time.

DESIGN OF A 250-MGD VERTICAL-TUBE EVAPORATOR FOR SEAWATER DESALTING,
Oak Ridge National Lab., Tenn.
R. P. Hammond, I. Spiewak, and E. C. Hise.
IN Proc Western Water Power Symp, Los Angeles, Apr 1968. Western Periodicals, North Hollywood, Calif, 1968. p C-51-57, 3 fig, 6 ref.
Identifiers Conceptual design, Falling film evaporation, Flash evaporation, Vertical tube evaporators, 51-250 MGD plant, Capitalized costs, Concrete construction, Dual-purpose plant, Dual-purpose plant economics, Economic evaluations, Energy costs, Fabrication methods, Fixed charge rate, Heat transfer surfaces, Multiple effect distillation, Multistage flash distillation, Nuclear energy sources, Operating costs, Performance ratio, Synthetic resinsPlastics, Thermodynamics.

Under OSW sponsorship, ORNL prepared a conceptual design of a 250-mgd plant combining 15 effects of vertical tube, falling film evaporator with 50 stages of flash evaporator feed heating. The vertical tube surface is of the doubly fluted type, providing heat fluxes 2 to 3 times those of smooth tubes, and permitting design of a compact, closely coupled evaporator configuration. Additional economies are achieved by use of concrete structures and plastic materials. A preliminary investigation of several proposed processes, heat transfer surfaces, plant configurations, materials, and fabrication methods was made in sufficient depth to select those best suited to this specific set of circumstances. The combined multiple-effect multistage flash process chosen is thermodynamically more efficient (provides more water for a given operating temperature range) than either process on its own. Choice of a performance ratio of 13 lb/1000 btu was predicated upon the evaporator being coupled to a nuclear generator plant for the simultaneous production of water and power. The paper presents estimated capital and operating costs over a range of energy costs, fixed charge rates, and performance ratios. The conceptual design presents a strong economic incentive to pursue the development of vertical tube evaporator technology.

ADVANCES IN VERTICAL TUBE PLANTS FOR SEA WATER DISTILLATION,
Stearns-Roger Corp., Denver, Colo.
D. D. Kays.
IN Proc Western Water Power Symp, Los Angeles, Apr 1968. Western Periodicals, North Hollywood, Calif, 1968. p C-59-85, 6 fig.
Identifiers: *Falling film evaporation, *Multiple effect distillation, *Multistage flash distillation, *Vertical tube evaporators, Distillation processes, Dual-purpose plant, Flash evaporation, Heat recovery system.

A brief history of modern distillation development is combined with a summary of the current state of the art relative to the multiple-effect-vertical-tube seawater distillation process. Advanced designs possible with (1) extended surface falling film

tubes and (2) multiple stage flash heat recovery within each effect are developed analytically and described qualitatively. Progress design considerations for utilizing these concepts are presented. The overall technical advantage of the vertical tube distiller is shown by a direct comparison to the MSF recycle plant. The ease with which the vertical tube plant may be designed for large capacities is discussed. A few of the desirable features of coupling a VTE distiller to a nuclear fuelde power plant are presented.

STUDY OF TWO-PHASE METASTABLE FLOW,
Foster Wheeler Corp., Carteret, N.J.
R. W. Bryers, and W. S. Hsieh.
OSW R and D Progr Rept No 234, Nov 1966. 150 p, 46 fig, 4 tab, 20 ref.
Identifiers: *Fluid flow, *Two-phase flow, Flow distribution, Fluid dynamics, Fluid mechanics, Multistage flash distillation, OSW sponsored, Turbulent flow, Water flow.

An experimental study was made to determine the flow rate of saturated water through short tubes of various lengths and diameters. Tubes of both rounded and sharp edge entrances were tested in the horizontal and vertical positions. It was found that the fluid passed through the aperture in the metastable state. Critical flow rates existed for all test runs. The critical mass flow rates were dependent on both the length and the diameter of the tubes instead of the length to diameter ratio alone. The critical mass flow rate was found to be proportional to the ratio of the specific volume of the vapor and liquid to the .630 power and the aperture volume to the .163 power. Test results were analyzed and correlated. The flow patterns within the test tube were photographed by a high-speed movie camera to obtain a qualitative interpretation of the two-phase fluid flow.

INVESTIGATION OF CORROSION IN HOT SEA WATER IN AN EXPERIMENTAL LOOP APPARATUS,
Battelle Memorial Inst., Columbus, Ohio.
F. W. Fink, E. L. White, and W. K. Boyd.
OSW R and D Progr Rept No 225, Dec 1966. 30 fig, 9 tab, 3 ref.
Identifiers: *Corrosion tests, *Low alloy steels, *Nickel alloys, *Pitting (Corrosion), *Stainless steels, *Titanium, *Tubing (Metal), Aluminum alloys, Carbon steels, Concentration cell corrosion, Deaeration, OSW sponsored, Removal from feedwater, Carbonate, Scale prevention, Stress corrosion, Temperature control, Velocity control, Wrightsville beach plant.

An experimental program was undertaken at Wrightsville beach to study scale control and corrosion of metals in deaerated seawater to 300 deg F. Test materials included carbon and low-alloy steels, stainless steels, and nickel- and aluminum-base alloys. Performance of loop-component materials is given. Acid treatment to remove carbonate ion resulted in minor scaling at 250 deg F. In seawater at neutral pH, corrosion was minimized under carbonate-free conditions. All metals showed general or localized attack under certain conditions. Corrosion rate of steel was accelerated by temperature even at low oxygen levels. Low-alloy steels exhibited more tendency to pitting. Straight chromium steels were subject to severe pitting. Austenitic stainless steels and some high-nickel alloys showed excellent resistance at velocities of 5 ft/sec or greater. Under stagnant conditions or at crevice areas, however, pitting was encountered. At 250 deg F aluminum alloys performed poorly after two weeks. Titanium heat-exchanger tubing exhibited excellent resistance but was prone to crevice attack. Hastelloy C performed well as equipment components except in the pump where cracking occurred, presumably due to weld repairs or faulty design. Corrosion rates for test materials are given as a function of temperature, time, and velocity.

The U.S. Congress in 1952 enacted legislation authorizing a research program for development of practicable low-cost means of producing from seawater, or other saline waters, water of a quality suitable for agriculture, industrial, municipal and other beneficial consumptive purposes. With an initial appropriation of $175,000, the Secretary of the Interior established the Office of Saline Water. The U.S. Desalting Program has received continuing and increasing support by Congress. In 1968, the OSW appropriation for research and development activities was $24.5 million, bringing the total U.S. Government investment in desalting technology to more than $130 million. This paper reviews the status of desalting technology when the U.S. program was initiated and reports on major activities achieved since then. The current status of freezing methods and membrane processes is discussed, but major emphasis is on the present state-of-the-art of distillation techniques and the utilization of nuclear reactors as an energy source for multimillion gallons-per-day water-only or dual-purpose power and water plants.

UNITED KINGDOM APPROACH TO DESALINATION AND NUCLEAR POWER,
Atomic Energy Authority, Risley (England).
H. Kronberger.
Preprint of Paper SM-113/71 Presented at IAEA Symp Nucl Desalination, Madrid, Nov 18-22, 1968. 7 p.
Identifiers: *Dual-purpose plant, *Multistage flash distillation, Flash evaporation, Freeze processes, Membrane processes, Pilot plant operations, 0-50 MGD plant.

The first phase of the UK National desalination program was initiated in 1965 for a 3-yr period with a government appropriation of $3 million. Responsibility was vested in the Ukaea, with two objectives - (1) to further development of the multistage flash process and (2) to explore alternative processes which might supersede MSF. The first objective was pursued in close collaboration with Weir Westgarth Ltd., while the second was begun solely as a Ukaea responsibility, with alternatives reduced to freezing, electrodialysis, and reverse osmosis. Industrial collaborators have been named for these processes. Most of the first-phase budget was directed toward MSF development. A new seawater experimental establishment was constructed by Weir Westgarth at Troon, Scotland, with facilities to test plant features up to 10 MGD in size. Large-scale facilities are also being operated, or are under construction, in industrial laboratories for electrodialysis and freezing. A second 3-yr program was authorized in 1968, at a cost of $9.6 million. A new contract is being placed with Water Research Association to extend their work on conjunctive use of desalination and conventional water supply to specific problems of such use in other countries.

EVAPORATION COEFFICIENT OF LIQUIDS,
Rochester Inst. of Tech., N.Y.
J. R. Maa.
Ind Eng Chem Fundamentals 6, 504-18, 1967. 8 tab, 24 fig, 15 ref.
Identifiers: *Film evaporation, *Heat transfer, *Heat transfer coefficient, Conduction (Heat), Heat exchangers.

Thermal gradient calculations have been made in an attempt to place the technique of the jet tensimeter on a quantitative basis. Families of curves have been derived with which experimental data can be compared. Using the jet tensimeter, evaporation rates of water, isopropyl alcohol, carbon tetrachloride, and toluene have been examined at various liquid temperatures, times of exposure, and back pressures of vapor. The experimental results agree satisfactorily with the thermal gradient calculations, making the assumption that the evaporation coefficient is unity. This shows that there is little or no resistance to molecules crossing the vapor-liquid interface in addition to the natural resistance imposed by the gas laws. As a corollary, when any vapor molecule strikes at the interface,

the chance of failing to cross is small. No significant difference in the behavior of evaporation due to the difference in molecular structure or chemical properties was observed.

PRACTICAL CONSIDERATIONS IN DESALTING AND ENERGY DEVELOPMENT AND UTILIZATION,
Atomic Energy Commission, Washington, D.C.
J. T. Ramey.
Preprint of Paper SM-113/70 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 16 p, 7 ref.
Identifiers: *Dual-purpose plant economics, *Nuclear energy sources, *Water utilization, Base-load, Dual-purpose plant, Economic evaluations, Energy sources, Nuclear desalination, Peaking power, Water costs estimate.

The combination of nuclear power and desalting in large dual-purpose installations tends to maximize economics inherent in large-scale operation. Water costs of 30-40 cents/1000 gal from large (100 mgd-300 mwe) plants appear to be achievable in plants of the near future. Technological advances will further reduce this cost, making the long-range economic outlook for large-scale desalting quite favorable. Combining production of water and electric power requires planning for development of both resources. Various approaches to unified resource development may be taken, including consideration of peak vs base load power requirements, use of hydro-power to supplement power from the dual-purpose plant in peak periods, and ability to store desalted water in existing facilities. These factors also introduce a need to carefully assess values assigned to the two products. Application of nuclear desalting to the energy center concept is essentially tailored to special problems and opportunities of developing nations. Factors which must be considered are complex and diverse, including such elements as water and power demands, agricultural production and marketing, industrial capabilities and the market for manufactured products, as well as financial and even sociological considerations.

THE RESULTS OF SOVIET RESEARCH ON DESALTING OF WATER,
Desert Inst., Ashkhabad (USSR).
M. V. Kolodin.
Translation from Problemy Osvoyeniya Pustin No 6, p 33-41, 1967. Soviet Geography: Review and Translation, Vol 9, No 6, June 1968, p 493-502, 1 tab, 16 ref.

Descriptors: *Desalination, *Desalination plants, *Scaling, *Arid lands, *Economics, Desalination processes, Distillation, Freezing, Flash distillation, Electrodialysis, Solar distillation, Boiling, Saline water, Costs.
Identifiers: *USSR, Natural freezing.

The author reviews saline-water conversion progress and lists plants installed or planned for installation in the USSR. The technical characteristics and costs per unit of converted water are summarized. Costs range from an estimated 0.06 rubles per cubic meter for a dual purpose atomic energy plant under construction in the Kazakh SSR to 14.60 rubles per cubic meter for a small straight distillation plant built in 1907 in Turkmenia. The conclusion is that considerable success has been achieved in design of large scale plants but a great need exists for small stationary and portable units for use in rural areas. (Crouse-Arizona)

FLOW THROUGH POROUS MEDIA: A STATISTICAL APPROACH,
Martin Marietta Corp., Baltimore, Md. Research Inst. for Advanced Studies.
Ruth H. Aranow, and Louis Witten.
Avail from Superintendent of Doc, US Government Printing Office, Wash DC, 20402 - Price $0.40. Office Saline Water Res and Develop Progr Rep No 354, Aug 1968. 31 p, 19 ref, 1 append. Contract No 14-01-0001-411 OSW.

Descriptors: *Ion transport, *Membrane processes, *Flow, *Porous media, *Statistical models, Statistical methods, Membranes, Fluid friction, Immiscibility, Equations, Thermodynamics, Hydrodynamics, Desalination processes, Desalination.
Identifiers: Immiscible fluids, Miscible fluids, Multicomponent fluid systems, Irreversible processes, Charged membranes.

The statistical mechanical treatment of ion transport processes in multicomponent fluid systems developed by Bearman and Kirkwood is adapted to include flow in porous media. The rigid medium is treated as if it were one of the components of the multicomponent fluid system, but it is constrained by an external force which prevents its motion. Various equations are presented which clarify the problem of 'fingering' at the displacement front between two immiscible fluids in the membrane. The equations lead under restrictive conditions to the same results as the theoretical developments of Scheidegger and Brinkman. New equations for flow in miscible multicomponent systems are suggested. Darcy's constant is given a statistical interpretation in terms of pair correlation functions through the definition of the friction coefficient. The development also serves as a connecting link between hydrodynamics in porous media and the thermodynamics of irreversible processes. (Carstea-USGS)

RATIONALE FOR LOW-COST NUCLEAR HEAT AND ELECTRICITY,
Oak Ridge National Lab., Tenn.
J. A. Lane.
In: Abundant Nuclear Energy, Proc Sym Gatlinburg, Tenn, Aug 1968. Published in AEC Symp Ser 14, (CONF-680810), p 3-28, 1969. 11 fig, 15 tab, 9 ref.
Identifiers: *Energy costs, *Nuclear energy sources, Breeder reactors, Converter reactors, Energy sources, Process heat.

A review of the historical use of energy reveals that the amount used by any one person is strongly dependent on its cost. An extrapolation of this trend to the year 2000 results in a projection that the average delivered cost of electricity in the U.S. will decrease to 3.5 mills/kwhr and the per capita consumption will increase to 30,000 kwhr per annum. Achieving such low-cost power will require significant improvements in generating costs, as well as reductions in transmission and distribution costs. This paper describes in some detail how this might be done. Generating costs, for example, will be reduced to about 1.5 mills/kwhr through the development of very large (i.e., 5000-mwe) high-performance breeders served by large-scale fabrication and processing plants. Nuclear plants with such characteristics appear to be an achievable end product of the present lines of nuclear power development. If the sale price of electricity is properly assigned to various types of customers as a function to the amount used by each customer, an average delivered price of 3.5 mills/kwhr would result in a rate of 5.5 mills/kwhr for residences and 1.5 mills/kwhr for industries. These prices will be low enough to stimulate an electricity binge on the part of both the household user and new industrial users.

INTEGRATION OF WATER REQUIREMENTS IN ARID AREAS BY MEANS OF DUAL-PURPOSE PLANTS FOR THE DESALINATION OF SEA WATER AND PRODUCTION OF ELECTRIC POWER. OPERATIONAL RESULTS OBTAINED BY THE ITALSIDER PLANTS AT TARANTO, ITALY (IN ITALIAN),
Societa Italiana Implanti, Genoa.
G. Carolei, C. Franzosi, and M. Jemma.
Preprint of Paper SM-113/3 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 21 p, 3 fig, 6 ref.
Identifiers: *Dual-purpose plant, *Flash evaporation, *Operating experience, Corrosion problems, Dual-purpose plant economics, Energy sources, Operating costs, Scaling, Turbine driven pumps, Turbine-generators.

The plants are considered in a dual-purpose context and the relevant heat cycle efficiencies are considered. An overall increase in efficiency is noted when compared with plants for desalination only. An economic advantage lies in the possibility of selling the electrical power produced at the same time as the fresh water. These plants are thus well suited to regions of rapid industrial and social development which are also near large settlements of the agricultural and residential type. The large flash evaporation units installed in the Italsider iron and steel works at Taranto can also be considered as dual-purpose plants since they utilize exhaust steam which has already undergone two enthalpy steps, first in the turbo-alternators at the thermoelectric station, and then in two turbopumps. In connection with the latter installation, the authors analyze the operational results and steps taken to solve problems of scaling and corrosion, as well as problems caused by the presence of metal ions in solution in the product water, some of which is intended for use in high-pressure boilers.
W70-01947

INTEGRATING DUAL-PURPOSE PLANT FOR POWER AND WATER PRODUCTION INTO AN EXISTING ELECTRICITY SUPPLY SYSTEM,
Electro-Watt Engineering Services Ltd., Zurich (Switzerland).
K. Goldsmith.
Preprint of Paper SM-113/42 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 10 p, 3 fig.
Identifiers: *Dual-purpose plant, *Load following, *Peaking power, *Product ratio, Base-load, Dual-purpose plant economics, Economic evaluations, Energy sources, Load factor, Nuclear energy sources, Plant factor, Process heat, Reactor power cycle, Steam cycle, Water storage.

The operating regime demanded of various types of generating plant is illustrated with reference to daily and annual load curves of typical supply systems in areas of potential water shortage. It is shown that, if a particular dual-purpose plant exceeds a critical size, which may be less than its optimum size, it will be of maximum value to the system if its power output can be cyclically or seasonally varied to suit system requirements. Water production costs from this plant will then be lowest. Thus, with a constant amount of heat produced by boiler or reactor, the heat/power ratio on the generating side may have to be altered, in the short term to keep it in step with the system load curve and in the long term to accord with the changing position of the power plant in the general order of merit of all other generating plant in the system. Water is then produced counter-cyclically, i.e., at a maximum rate at times of minimum power demand, any temporary water surplus being stored. Steam cycles for varying heat-power ratios are briefly reviewed and their economics discussed.
W70-01948

COMBINATION OF HIGH-TEMPERATURE REACTOR WITH A CLOSED-CYCLE GAS TURBINE AND DESALINATION PLANT,
Gutehoffnungshuete Sterkrade A.G., Oberhausen (West Germany).
A. Ehret, H. Sonnenschein, and E. Bohm.
Preprint of Paper SM-113/6 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 13 p, 6 fig, 5 ref.

Identifiers: *Converter reactors, Process heat, *Turbine operation, Design, Dual-purpose plant, Dual-purpose plant economics, Multistage flash distillation, Reactor power cycle, Thermodynamic analysis, Turbines.

High-temperature reactors with closed-cycle gas turbines are suitable for combination with a desalination plant, as even in the course of normal operation waste heat is partly available at a sufficiently high temperature level to permit its use as process heat. To increase the water production in a dual-purpose plant several methods are available to esstentially increase the quantity of process heat in a closed gas turbine cycle. Which of these methods is most economic depends on several operating conditions. In some cases, the loss of electric power with increasing process heat supply is extremely low. Therefore, the costs of this additional heat are also extremely low and water production in such a plant is very economical. When combining a gas turbine circuit with a multistage flash evaporation plant, some special conditions of adaptation arise because the temperature of the working fluid is not constant during reheat extraction. From this a strong dependence between fresh-water output, maximum brine temperature, specific heat consumption in the desalination plant and process heat supply from the gas turbine plant results if the most economic design of dual-purpose plant is desired.
W70-01949

THE SODIUM-COOLED FAST BREEDER REACTOR AS A HEAT SOURCE FOR DESALINATION PLANTS,
Bechtel Corp., San Francisco, Calif.
R. A. Langley, and R. L. Clark.
Preprint of Paper SM-113/40 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968.
Identifiers: *Breeder reactors, *Economic evaluations, *Liquid-metal fast-breeder reactors, Coupling (Reactor-Desalting Plant), Design, Dual-purpose plant economics, Single-purpose plant economics, 0-500 MW (E) reactors, 500 plus MW (E) reactors.

Design evolution of the sodium-cooled fast breeder reactor as a dual-purpose or single-purpose energy source as it is affected by application to desalination is considered. Technical problems treated include selection of plant operating temperature, the steam cycle for the dual-purpose plant, ratio of electric power output to process steam, steam generator design, the need for a tertiary water loop between the liquid metal and the brine heaters, and containment design. These problems are discussed in terms of the 250-500 mw (e) plants in preliminary design in the U.S. and the 1000 mw (e) plants being studied as part of the USAEC Liquid Metal Fast Breeder Reactor Program. Evaluations of power and water costs for dual- and single-purpose plants as functions of plant size are made. Estimates of possible future power and water cost reductions as a result of design evolution and the development of a viable industry are also included.
W70-01950

PUMPED STORAGE - THE HANDMAIDEN OF NUCLEAR POWER,
Northeast Utilities Service Co., Hartford, Conn.
S. R. Knapp.
IEEE Spectrum 6 (4), p 46-52, 1968. 3 fig, 1 ref.
Identifiers: *Applications of nuclear energy, *Pumped storage, *Reviews, Base-load, Economic evaluation, Electrical System designs, Load factor, Northeast United States, Peaking power, Spinning reserve, Systems engineering.

The power companies of the New England States, where fossil fuel cost is high, have determined that low-variable-cost nuclear generation is desirable for this region. The construction of pumped-storage hydro plants, favored by the topography of the area, will offset the relatively high fixed costs of nuclear plants by maximizing the capacity-use factor of the nuclear facilities and thereby minimizing the total cost per unit of energy output. This combination provides efficient base load, economical peaking capacity, and effective spinning reserve, along with many recreational and other social benefits.

PRESSURIZED-WATER REACTORS FOR NATURAL AND ENRICHED URANIUM,
Siemens A. G., Erlangen (West Germany).
B. C. Drude, and F. H. Rohl.
Preprint of Paper SM-113/7 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 19 p, 6 fig, 6 ref.
Identifiers: *Dual-purpose plant, *Dual-purpose plant economics, *Nuclear energy sources, *Pressurized-water reactors, Energy sources, Heavy-water reactors, Turbine operation, Turbines.

Pressurized-water reactors are particularly well suited for high-capacity desalting plants. The heavy water and light water pwrs developed by Siemens Company represent two modifications of a common line. Reactors of either type with capacities up to 600 mw (e) in steel or concrete pressure vessels are available. Nuclear dual-purpose plants for electric power and process steam generation are rapidly gaining in importance. Technical and economic characteristics of high-powered units as required by the chemical industry have been studied for various flow schemes and ratings. Advantages and disadvantages of the back-pressure turbine cycle, offering the highest water-to-power ratio, are examined on the basis of realistic operating conditions. The economy of the plants may be improved by increased power production and adoption of suitable flow schemes. The advantages and disadvantages incurred by an extraction turbine or by a combination of back-pressure and condensing turbines are discussed. Specific investment and production costs of power and process steam are illustrated. For any particular case the two main parts of a dual-purpose plant may be chosen from among reactors of different design characteristics, and evaporators of different origin.

TECHNICAL AND ECONOMIC ASPECTS OF MEDIUM-POWER PLANTS FOR THE COMBINED PRODUCTION OF ELECTRICAL POWER AND DESALINATED WATER, USING VULCAN REACTORS AND LTV UNITS (IN FRENCH),
Societe Belge pour l'Industrie Nucleaire, Brussels; and Universal Desalting Corp., New York.
P. Maldague, C. Descamps, W. Debay, A. Paquet, and W. Bongard.
Preprint of Paper SM-113/17 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 19 p, 9 fig, 8 ref.
Identifiers: *Duel-purpose plant economics, *Vertical tube evaporators, Duel-purpose plant, Economic evaluations, Fixed charge rate, Nuclear energy sources, Pressurized-water reactors, Water costs estimate, 0-3000 MW (T) Reactors, 0-50 MGD Plant.

The technical and economic aspects of a dual-purpose plant are described. The plant couples a 280 MW (T) pressurized water reactor of the vulcan type with an LTV (Long Tube Vertical) desalination unit. The combination will produce 61 MW (E) and 24 MGD of product water. If power is assumed to be sold at 8 mills/kwh and a fixed charge rate of 11% is used, product water is estimated to cost 51.1 cents/1000 gal. If a fixed charge rate of 6% is assumed, the cost of water decreases to 40.1 cents/1000 gal.

ASPECTS IN DEVELOPING SEA WATER FLASH-DISTILLATION PLANT TO NUCLEAR-HEATED PLANT ON THE BASIS OF EXPERIENCE GAINED IN THE DESIGN, START-UP AND OPERATION OF SUCH INSTALLATIONS,
Atlas-Mak Maschinenbau G.m.b.H., Bremen (West Germany); and Fried-Krupp, Essen (West Germany). Zentralinstitut fuer Forschung und Entwicklung.
H. Laban, and W. Hohenhinnebusch.
Preprint of Paper SM-113/8 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 30 p, 12 fig, 4 ref.
Identifiers: *Corrosion control, *Dual-purpose plant economics, *Energy sources, *Operating experience, Corrosion, Distillation processes, Dual-purpose plant, Evaporators, Flash evaporation, Fossil fuels, Multistage flash distallation, Nuclear energy sources, Turbines, 0-50 MGD plant.

In 1965 the first major desalination plant of German design and with evaporators of German manufacture was built in Ceuta on the North African coast. The experience of construction, start-up, and several years of operation of the 1 MGD, 5000 KW (E) plant is described. Layout of the plant (flash evaporators arranged in two 24-stage blocks of 500,000 GPD each) and design of components and their resistance to corrosion are explained. Based on experience gained from this plant and numerous smaller installations, concepts for development of large-scale plants in combination with nuclear power stations are outlined. The possibility of combining a flash distillation plant with a gas turbine power station because of the cheap supply of waste heat is discussed. Cost aspects of such a dual-purpose installation are shown with reference to the various cycles on the basis of results obtained from different calculations.

HIGH-TEMPERATURE DESALINATION PLANTS FOR NUCLEAR POWER STATIONS,
Baldwin-Lima-Hamilton Corp., Philadelphia, Pa.
R. A. Tidball, and J. G. Gaydos.
Preprint of Paper SM-113/26 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 19 p, 11 fig, 5 ref.
Identifiers: *Multiple effect distillation, *Multistage flash distillation, *Water costs estimate, Wrightsville Beach Plant, Capitalized costs, Condensers, Energy costs, Fixed costs, Scale prevention, Scaling.

The maximum temperature to which brine can be heated in a multistage flash plant affects both capital costs and energy costs charged to the product water. It was demonstrated at the DSW east coast test facility that seawater can be treated with sulphuric acid and heated in a once-through plant to 300 deg F without scale formation in the condenser tubes. Scaling will occur at temperatures above 270 deg F when this seawater is recirculated with or without concentration. A combination of a once-through high-temperature effect with either a single-effect multistage flash plant (SEMS) or a multieffect multistage (MEMS) flash plant can be utilized to reduce both capital cost and energy charges. Purity of product water from most MSF plants varies from 5 to 100 PPM TDS. Purer water (down to 1 PPM) can be made at an increase in capital cost. Capital charges, energy charges and chemical charges are compared for 150 MGD plants using the SEMS, MEMS and the once-through topping plant in combination with both. The cost of water is presented based on these adaptations to the MWD study.
W70-01955

OPTIMUM BRINE HEATER STEAM TEMPERATURE ON MSF EVAPORATOR COUPLED WITH FOSSIL AND NUCLEAR FUELED POWER PLANTS,
GHH-Man Technik, Essen (West Germany).
B. Kunst.
Preprint of Paper SM-113/9 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 13 p, 16 fig, 5 ref.
Identifiers: *Brine heaters, *Dual-purpose plant economics, *Multistage flash distillation, *Pres-

surized-water reactors, Computerized design, Coupling (Reactor desalting plant), Economic evaluations, Energy sources, Single-purpose plant economics, Turbines.

The results of a computerized optimization study are presented in graphical form. Neither the computer program nor its flowsheet is given. Assumptions include 13% fixed charge rate, 7000 hours operation per year, fuel oil at 32 cents/MBTU, nuclear heat about 14.6 cents/MBTU, and terminal temperature difference of 4 deg C. Heat sources considered include a pressurized water reactor with a steam turbine, a high-temperature gas reactor with a gas turbine, and an oil-fired boiler with a steam turbine. Both single- and dual-purpose plants are considered. Optimization curves show the influence of the process steam temperature, the influence of the water-to-power ratio, the influence of capacity, and the water and power prices resulting from the optimizations. On the basis of the assumptions made, the high-temperature gas reactor is suitable for dual-purpose plants up to a water-to-power ratio of liters/KWH and the PWR system up to 140 liters/KWH depending upon capacity. In all cases a marked trend is noted towards process steam temperatures over 130 deg C.

HOT BRINE ENERGY STORE,
Aktiebolaget Atomenergi, Stockholm (Sweden).
P. H. Margen.
Energy Intern 6 (5), p 16-20, 1969. 8 fig, 1 ref.
Identifiers: *Peaking power, *Steam cycle, *Thermal-hydraulic design, *Water storage, Brine flow, Brine system designs, Dual-purpose plant economics, Pumped storage, Turbine operation.

One of the cheapest methods of energy storage is the storage of warm water at moderate pressures. In a combined electricity and desalting scheme, hot brine provides a convenient means of storing energy. Using a technology developed for district heating schemes, hot brine can be stored in the upper part of a storage accumulator and cooler brine in the lower part. When the brine accumulator is charged with heat, hot water is fed in at the top and cooler water is discharged at the bottom, so that the level subdividing the water regions at the two temperatures gradually falls. During discharge, the flow is reversed. The accumulator can be charged by the use of bled-off steam during off-peak electricity periods, thus reducing electricity generation at such times. It can be discharged at periods of peak electricity demand, allowing the turbine to operate without bled steam as a pure condensing turbine, producing a maximum amount of electrical power. Thus the electricity output can be varied over a certain range, while the nuclear steam generating unit and desalting unit operate continuously at constant full load. Preliminary calculations indicate that such operation would result in significant savings even though the large accumulator would require a large investment.

SOME FEATURES REQUIRED OF NUCLEAR REACTORS FOR DUAL-PURPOSE WATER/POWER PRODUCTION,
United Kingdom Atomic Energy Authority, Risley (England).
H. Kronberger.
Preprint of Paper, LAEA Symp Nucl Desalination, Madrid, Nov 18-22, 1968. 7 p.
Identifiers: *Dual-purpose plant economics, *Economic evaluations, *Load factor, Amortization criteria, Base-load, Dual-purpose plant, Peaking power, Thermodynamic analysis, Water costs estimate.

Of paramount importance in determining the economics of dual-purpose operation is maintenance of high load factor for the entire life of the complex. A new approach to reactor operation with a dual-purpose function is outlined. The background, technical features, and operating experience of UK-designed reactors (AGR, SGHWR, HTR, PFR) are outlined. Nuclear powered desalting plants might best be operated as water producers rather than power units. As water producers, they could take advantage of the 90% availabilities of British nuclear reactors. As an example, a dual-purpose 200 MW (E), 120 MGD SGHWR plant was examined. With 10% capital interest, a 25-year amortization period, and an average load factor of 75%, water costs were 55.4 cents/1000 gal with an electricity credit of 6.6 mills/kwhr. On the theory that such a plant could have a 90% availability, continuing operation at 90% load factor was considered even with the electricity part of the plant relegated to a position of lower importance, when it would normally be shut down. An extreme case considered is that of dumping the high-pressure steam, but keeping the desalting plant in operation. By doing this the water production is increased by 20% over 75% load factor operation with a total operating cost increase of only 5%. Water costs drop from 55.5 cents/1000 gal to 48.6.
W70-01959

THE MAIN UNCERTAINTIES IN THE ECONOMICS OF NUCLEAR ENERGY FOR THE PRODUCTION OF DEALINATED WATER,
Commissariat a l'Energie Atomique (France).
L. Thiriet, and P. Lievre.
Preprint of Paper SM-113/20 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 14 p, 2 fig, 3 ref.
Identifiers: *Dual-purpose plant economics, *Energy costs, *Nuclear energy sources, Cost allocation, Economic evaluations, Energy sources, Heat transfer coefficient, Interest, Nuclear desalination.

Scaled economies favor nuclear energy over conventional thermal energy. Thus when requirements for electrical power and heat, especially for desalination, are great enough, a favorable view may be taken of the use of nuclear energy, subject to certain assumptions. The validity of conclusions reached on the basis of these assumptions is discussed. The first part of the paper examines unknown factors associated with technical, economic and financial data (various transfer coefficients, service life of parts based on choice of materials, price trends, the shape of cost functions and interest rates). The second part discusses unknown factors associated with the optimization method used and the criterion of choice selected. It is shown that in most cases it is extremely difficult to reach a categorical conclusion as to whether or not nuclear energy is competitive for desalination, as many aspects of any given situation must be considered. (In French)

PROGRESS IN NUCLEAR POWER AND DESALINATION,
Southern California Edison Co., Los Angeles.
W. R. Gould.
In Nuclear Energy and Latin American Development, Nuclear Energy Laboratory, Univ of Calif, Los Angeles, p 49-55, 1969. Ed by C B Smith.
Identifiers: *Nuclear energy sources, Dual-purpose plant economics, Energy sources, Fossil fuels, Reviews.

A brief review of the present status of the construction of nuclear electric power plants in the United States and of the potential for dual-purpose power-desalting plants. The general conclusion is that the growth of nuclear power will be accelerated in proportion to the extent that the coal industry is unable to hold the line on prices, and more importantly, will depend on the ultimate development of fast breeder reactors. As the results of advancing technology and continued competition from the coal industry, we have long-range prospects of cheaper electrical energy and eventually of obtaining inexpensive fresh water using nuclear power.
W70-01961

THE ROVI REACTOR FOR DESALINATION OF SEA WATER - DESIGN AND INSTALLATION CRITERIA,
Montecatini Edison, Milan (Italy).
U. Cassinari, A. Grandellini, A. Vaudo, and G. Vacchelli.
Preprint of Paper SM-113/1 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 16 p, 4 fig, 3 ref.
Identifiers: *Coupling (Reactor-Desalting Plant), *Design criteria, Converter reactors, Plant safety analysis, Reactor design, Single-purpose plant, 0-3000 MW (T) Reactors, 0-50 MGD Plant.

Basic criteria are presented for design of a single-purpose low-power reactor for desalination of seawater, as well as criteria for optimum coupling of the reactor to the desalting plant. The ROVI reactor, cooled and moderated by hydrogenated terphenyl and designed for a power level of 100 MW (T) and a fresh water output of 13 MGD, was used for the study. Safety systems, fuel handling, ancillary cooling equipment, and possibility of producing on-the-spot power required by auxiliary plant facilities are discussed in detail, with particular attention to an analysis of reliability characteristics of the plant, the problem of reserve, and measures which might be necessary in this connection. A preliminary cost estimate is made with special reference to the size of the different facilities.

THE ECONOMIC DEVELOPMENT OF NUCLEAR DESALTING PLANTS IN WATER AND POWER SUPPLY SYSTEMS,
Hawaii Univ., Honolulu; and Calif. Univ., Los Angeles.
N. A. El-Ramly, and J. M. English.
Preprint of Paper SM-113/35 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 10 p, 5 ref.
Identifiers: *Dual-purpose plant economics, *Economic evaluations, Cost allocation, Design, Dual-purpose plant, Fixed charge rate, Interest, Product ratio, Systems engineering.

In addition to engineering factors influencing design characteristics of dual purpose plants, optimum size, product ratio, and other pertinent design variables are also dependent on economic and social influences, often peculiar to the geographic location under consideration. Factors and constraints affecting economics of system design are discussed. Relevant design variables are incorporated into a mathematical framework to show system interrelationship. It is indicated that optimum development depends on project timing in relation to long-range demand functions of water and power. Furthermore, the decision is sensitive to interest rates, demand growth patterns, and economics of scale. Optimum product ratio is determined by maximizing present worth of revenue minus cost streams. Effects of budget and other economic constraints as they pertain to the sequence of the total system development are considered. Merits of cost allocation policies and their effect on investment decisions are discussed. It is concluded that the proper method for allocating joint costs over the system economic life should be proportional to revenue steams. Also considered is economic implication of technological changes on rate of equipment obsolescence.
W70-01963

HEAT SUPPLY TO A DESALTING UNIT BY AN ORGANIC NUCLEAR SINGLE-PURPOSE REACTOR (IN ITALIAN),
Comitato Nazionale per l'Energia Nucleare, Rome (Italy); and Montecatini Edison, Milan (Italy).
L. Biondi, E. Crispino, R. Di Menza, F. Gazzabin, and E. Merli.
Preprint of Paper SM-113/5 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 7 p.
Identifiers: *Converter reactors, *Nuclear energy sources, *Single-purpose plant economics, Dual-purpose plant, Economic evaluations, Energy sources, Single-purpose plant.

Studies were performed for both single-purpose and dual-purpose plants on the problems of supplying heat from a nuclear plant to a desalting unit as a function of the fresh water capacity. In many areas where fresh water requirements are not high, it was concluded that single-purpose reactors producing only low-temperature heat may be more satisfactory than the large nuclear reactors of the present economic sizes. Of the different reactor types, organic reactors seem to obtain more advantage from the lowering of temperature and less disadvantage from the necessary reduction of size. The main rules which must be imposed on this reactor and the expected corresponding performance are taken into consideration.

OPTIMIZATION STUDY ON THE COUPLING OF A LOW TEMPERATURE ROVI REACTOR WITH A DESALTING PLANT,
Bari Univ. (Italy); and Comitato Nazionale per l'Energia Nucleare, Rome (Italy).
G. Nebbia, R. Di Menza, and L. Pierazzi.
Preprint of Paper SM-113/4 Presented at IAEA Sump Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 7 p, 1 fig, 8 ref.
Identifiers: *Single-purpose plant, *Single-purpose plant economics, *Water costs estimate, Distillatica processes, Energy costs, Multistage flash distillation, Precipitation, Scale prevention, Vapor compression evaporation.

Results of an optimization study of effects, on both reactor and distillation plant, of raising present operating temperatures to those which may be used in the future indicate that minimum steam cost in water-only low-temperature nuclear reactors such as the organic-cooled and moderated ROVI could be obtained in the range of 150 to 200 deg C. Raising maximum brine temperature from 120 to 180 deg C should decrease water costs about 15%. For high-temperature operation, probably lower water costs are obtained using distillation processes such as the LTV and vapor compression instead of multistage flash, utilizing scale control measures such as addition of saturated solution of barium chloride to seawater for precipitation of sulphates. Conclusion is that optimum conditions for desalination in developing countries may be derived using nuclear water-only plants, rather than dual-purpose plants.

THE FUTURE ROLE OF BREEDER REACTORS IN UTILITY PLANNING,
Westinghouse Electric Corp., Pittsburgh, Pa.
J. K. Dillard, C. J. Baldwin, and N. H. Woodley.
IEEE SPECTRUM 7 (3), p 100-107, 1969. 10 fig, 12 ref.
Identifiers: *Economic evaluations, *Electrical system designs, *Systems engineering, Boiling-water reactors, Breeder reactors, Fossil fuels, Present worth, Pressurized-water reactors, Single-purpose plant.

Economics of breeder reactors in a power system of 14,000 MW (E) initial installed capacity was studied over a 20-year period starting in 1986. Four expansion patterns with different mixes of water reactors, breeder reactors, and fossil units were compared by present worth methods using digital computer simulation programs developed to study long-range economic problems of utilities. Levelized annual savings of 25 to 50 million dollars were estimated for expansion patterns which included high gain breeders. Sensitivity studies showed that the capital cost of breeders can be over 50% higher than water reactors and still be economic, that substantial savings still exist for growth rates as low as 5%, and that the value of plutonium as fuel in breeders compared with water reactors can vary over a wide range without destroying the advantage of breeders.
W70-01966

COMPARATIVE ECONOMICS OF LARGE FOSSIL-FUELED VERSUS NUCLEAR GENERATING STATIONS,
Niagara Mohawk Power Corp., Syracuse, N.Y.
M. H. Pratt.
Proc Amer Power Conf 27, p 610-15, 1965. 2 ref.
Identifiers: *Energy sources, *Fossil fuels, *Nuclear energy sources, Economic evaluations, Energy costs, Scheduling.

We have reached the point where we can confidently expect the new generation of larger nuclear plants currently under way to be, at the very least, very close to the comparative economic level of fossil-fueled plants. The most important and critical question at the moment is whether or not we can depend on the large nuclear plant to be ready to operate as an integral part of a total system at the time when system load requirements demand that its capacity be available. The actual final costs of any project taking several years to build will always be something different from the original estimates. Since now the estimated costs for nuclear and for fossil-fired plants now have considerable overlap, the decision for one or the other must be made on the basis of the ability of meeting a schedule required by load demands.
W70-01967

BRINE-HEATER LEAKAGE CONTROL PROBLEMS IN LARGE POWER DESALTING PLANTS,
W. H. Kelley.
Reactor Fuel-process Technol 12 (1), p 80-87, 1969. 4 fig, 5 tab, 7 ref.
Identifiers: *Brine heater leakage, *Brine heaters, *Hazards, *Nuclear stream supply system, Boiling-water reactors, Breeder reactors, Brine flow, Brine system designs, Converter reactors, Dual-purpose plant, Heavy-water/organic-cooled reactors, High temperature gas-cooled reactors, Israel, Liquid-metal fast-breeder reactors, Metropolitan water district, Multistage flash distillation, Radioactive contamination, Saline contamination, Vertical tube evaporators.

A study was made of brine-heater leakage problems in large nuclear dual-purpose power-desalting plants utilizing light-water reactors and multistage flash evaporators. Leakage of reactor condensate into the water plant was found to have an inconsequential effect on product-water purity. Leakage of brine into the reactor presents a considerable problem in demineralization or blow-down-and-makeup cost. The best presently available solution to the demineralization problem appears to be the use of a coated-filter ion-exchange unit, with immediate shutdown of a leaking brine heater. An installed spare brine heater was found to be economically attractive in preventing loss of power and product-water revenues. The use of vertical tube evaporators in place of or in conjunction with the conventional brine heaters would ensure against leakage of brine into the reactor plant. Several schemes utilizing vertical tube evaporators appear economically attractive.

THE ROLE OF NUCLEAR ENERGY IN DESALTING - A REVIEW OF THE U.S. ATOMIC ENERGY COMMISSION DESALTING DEVELOPMENT PROGRAM, PROBLEM AREAS, AND POTENTIAL,
Atomic Energy Commission, Washington, D.C.
W. A. Williams, J. C. Roberts, and R. D. McFarren.
Preprint of Paper SM-113/36 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 14 p, 23 ref.
Identifiers: *Dual-purpose plant, Coupling (Reactor-desalting plant), Dual-purpose plant economics, Economic evaluations, Nuclear desalination, Nuclear energy sources, Reviews, Water utilization.

The Atomic Energy Commission sponsors studies and research and development aimed at utilization of nuclear energy for desalting and other large-scale industrial processes. The origin and history of the AEC program, as well as its objectives and plans, and the considerations entering into the formulation and implementation of these plans. The economics and technical features of nuclear energy in the production of desalted water and other industrial processes are discussed as well as the technical, economic, administrative and other considerations encountered and the influences these considerations have on planning the development and demonstration of a new technology and its utilization. The roles of general and specific studies are outlined and their contribution to the definition of development plans and program goals are briefly explained.

3B. Water Yield Improvement

RUNOFF INDUCEMENT IN AN ARID REGION BY REMOVAL OF VEGETATION,
Hebrew Univ., Jerusalem (Israel). Dept. of Botany.
N. H. Tadmor, and L. Shanan.
Soil Sci Soc Amer Proc, Vol 33, No 5, p 790-794, Sept-Oct 1969. 5 p, 3 fig, 2 tab, 19 ref.

Descriptors: *Watershed management, *Arid lands, *Vegetation effects, *Clear-cutting, *Water conservation, Water yield improvement, Runoff, Infiltration, Rainfall intensity, Soil moisture, Soil water movement, Soil physical properties, Rainfall-runoff relationships, Land management.
Identifiers: Negev Desert, Israel.

Watershed management was studied in an area 25 kilometers NW of Beersheba in the Negev Desert of Israel. The climate is Mediterranean, with hot dry summers and moderately cold winters. The annual runoff increased threefold from 7% to 21% after eradication of natural vegetation. Infiltration rates were increased by 40-50% by the vegetation cover. Both bare and covered areas required 2-4 mm/day of rainfall in order to produce runoff. Interception storage was 0.1-0.4 mm. (Carstea-USGS)

WATER RESOURCES APPRAISAL OF THE WARM SPRINGS--LEMMON VALLEY AREA, WASHOE COUNTY, NEVADA,
Nevada State Dept. of Conservation and Natural Resources, Carson City.
F. Eugene Rush, and Patrick A. Glancy.
Nevada Dept. of Conservation and Natural Resources, Water Resources-Reconnaisance Series Report 43, 1967. 70 p, 2 illus, 25 tab, 31 ref.

Descriptors: *Water resources, *Nevada, *Hydrologic aspects, *Geologic formations, *Water balance, Watersheds (Basins), Precipitation (Atmospheric), Inflow, Surface waters, Groundwater, Evapotranspiration, Irrigation, Water quality, Discharge (Water), Water supply, Hydrologic data, Transmissivity, Storage coefficient.

The area considered lies directly north of Reno in western Nevada, covering about 900 sq. mi. It is in the rain shadow of the Sierra Nevada and is arid, averaging less than 10 inches of precipitation per year. Because of its proximaty to Reno, further development of an urban-industrial nature is expected with ranching declining in importance. This report serves as a reconnaissance survey of the general hydrology of the area and may serve as a guide to further investigation as development requires. The alluvium of the valleys was found to be a maximum of at least 400 feet. To date little use has been made of groundwater-deposits, but tests for quality are suggested before beginning extensive drilling. At present all economically feasible

surface waters are developed and about 17,000 acre feet are imported annually from the Truckee River. Any additional water development will have to be from groundwater sources or importation. (Crouse-Arizona)
W70-01806

A BRIEF APPRAISAL OF THE WATER RESOURCES OF THE WALKER LAKE AREA, MINERAL, LYON, AND CHURCHILL COUNTIES, NEVADA,
Nevada State Dept. of Conservation and Natural Resources, Carson City.
D. E. Everett, and F. Eugene Rush.
Nevada Department of Conservation and Natural Resources, Water Resources-Reconnaissance Series Report 40, 1967. 44 p, 10 tab, 5 fig, 17 ref.

Descriptors: *Water resources, *Nevada, *Hydrologic aspects, *Evaporation, *Water balance, Watersheds (Basins), Lakes, Precipitation (Atmospheric), Inflow, Groundwater, Surface waters, Evapotranspiration, Geologic formations, Water quality, Irrigation, Reservoir evaporation, Discharge (Water), Hydrologic data, Groundwater recharge, Recharge, Water storage.
Identifiers: *Walker Lake (Nev).

The region considered includes Walker Lake Valley and adjacent valleys in west-central Nevada. The area is extremely arid with precipitation generally averaging less than 5 inches per year. This report gives a general reconnaissance survey of the hydrology of the area and may serve as a guide to further investigations that may prove desirable. Inflow to the area is estimated at 169,000 acre-feet per year while total discharge is about 265,000 acre-feet--largely evaporation from Walker Lake and Weber Reservoir. Walker Lake has been depleted at an average annual rate of about 100,000 acre-feet since 1908. Groundwater levels in the area have declined slowly because of lowering lake stage. The only significant groundwater development has been in the Hawthorne area for municipal and Naval Ammunition Depot use. Most of the groundwater is suitable for agricultural and municipal use. However, any future well development would have to be undertaken with the steadily declining ground water levels in view. (Crouse-Arizona)

PAPAGO FLOODWATER PASTURES SHOW PROMISE,
Arizona Univ., Tucson; and Bureau of Indian Affairs, Papago Indian Reservation, Ariz.
J. R. Simpson, R. A. Young, P. R. Ogden, and C. W. Whitfield.
Progressive Agriculture in Arizona, Vol 21, No 2, Mar-Apr 1969, 18-19. 2 photos, 1 tab.

Descriptors: *Range management, *Arizona, *Economic feasibility, *Costs, *Flood irrigation, Water yield improvement, Grazing, Brush control, Range grasses, Arid lands, Carrying capacity, Indian reservations, Pasture management, Irrigation practices, Runoff, Storm runoff.
Identifiers: *Papago Indian Reservation (Ariz).

Flood runoff from summer convective storms was used to irrigate supplemental perennial grass pasture on the arid Papago Indian Reservation west of Tucson, Arizona. Since the forage produced was of considerable value in providing feed during the hot, dry seasons, a cost analysis was made. It was found that where local flood runoff could be used for irrigation, the clearing and reseeding of range lands to blue panicgrass and Lehman lovegrass could be economically attractive. When amortized at 8% for 50 years, the cost was $2.14 per animal unit month. (Crouse-Arizona)

THE 'EL NINO' PHENOMENON AND RAINFALL IN PERU AND ECUADOR,
Texas A and M Univ., College Station. Dept. of Meteorology; and Texas A and M Research Foundation, College Station.
L. Glenn Cobb.
In Walter K. Henry et al., Research on Tropical Rainfall Patterns and Associated Mesoscale Systems. US Army Electronics Command, Ft. Monmouth, NJ Technical Report ECOM- 02313-S2, 1967, p 87-103. 17 p, 2 tab, 4 fig, 26 ref.

Descriptors: *Air circulation, *Arid lands, *Meteorology, *Ocean currents, *Precipitation (Atmospheric), Ocean circulation, California, Rainfall, Pacific Ocean, Temperature, Surface waters, Thunderstorms, Meteorological data.
Identifiers: *'El Nino' Phenomenon, *Peru, *Ecuador, Chile, Australia, Southwest Africa.

The cold Peru or Humboldt Current along the west coast of South America causes colder surface water temperatures along the coast than along the open ocean. The deserts of Chile and Peru are a result. At intervals of several years a general weakening of atmospheric circulation in the South Pacific results in a weakening of upwelling and significantly higher surface water temperatures known as the 'El Nino' phenomenon. The study reported here shows a high correlation between increased surface water temperatures and greatly increased summer rainfall on the adjacent coastal plain. Areas that normally have little or no rainfall will have at least several large thunderstorms during a season with the 'El Nino' phenomenon. It is suggested that with improved knowledge of atmospheric circulation it should be possible to predict these occurrences. Similar phenomena occur off California, southwest Africa, and western Australia. (Crouse-Arizona)

A PRELIMINARY FIELD STUDY OF SURFACE TREATMENTS FOR RUNOFF INDUCEMENT IN THE NEGEV OF ISRAEL,
Hebrew Univ., Jerusalem (Israel). Dept. of Agriculture; and National and Univ. Inst. of Agriculture, Rehovoth (Israel). Volcani Inst. of Agriculture Research.
D. Hillel, and E. Rawitz.
9th International Congress of Soil Science, Adelaide, Australia, 1968, Transactions, Vol 1, p 303-311. 9 p, 4 tab, 2 fig, 3 ref.

Descriptors: *Arid lands, *Water harvesting, *Surface runoff, *Soil treatment, *Agriculture, Soil dispersants, Soil aggregates, Soil compaction, Soil erosion, Soil structure, Semiarid climates, Runoff, Soil stabilization, Erosion, Infiltration, Rainfall-runoff relationships.
Identifiers: *Israel, *Negev Plains.

In arid or semiarid lands where rainfall is insufficient but soil is otherwise arable, increase of surface runoff from sloping lands to the planted area would be of great importance. Field trials conducted in the Negev Plains included such treatments as compaction, salting, fuel oil spray, cultivation, and aggregation with krilium. Stable aggregate formation reduced runoff to practically zero, whereas crust formation with fuel oil induced runoff in excess of 80% of seasonal rainfall. Excessive erosion occurred in salt-treated and cultivated plots. Erosion from the fuel oil treatment was low. This promising treatment would also be useful for water harvesting applications. (Crouse-Arizona)

THE ISRAELI ARTIFICIAL RAINFALL STIMULATION EXPERIMENT. STATISTICAL EVALUATION FOR THE PERIOD 1961-65,
Hebrew Univ., Jerusalem (Israel).
K. R. Gabriel.
Berkeley Symposium on Mathematical Statistics and Probability. 5th, Berkeley California, 1965-1966, Proceedings, Vol 5, 1967, p 91-113. 23 p, 12 tab, 3 fig, 28 ref.

Descriptors: *Cloud seeding, *Statistical methods, *Silver iodide, *Arid lands, Weather modification, Design criteria, Aircraft, Data collections, Precipitation (Atmospheric), Analytical techniques.
Identifiers: *Israel, *Experimental design, Randomized crossover design.

This paper presents a statistical evaluation of effects on precipitation of cloud seeding experiments using silver iodide in Israel. A randomized crossover design was used. Problems of analysis and advantages of design are discussed. Average excess of precipitation on seeded days was about 15% - significant at the 5% level. The secondary objective of identifying meteorological conditions favorable or unfavorable to successful stimulation was not achieved at the time of this report. Apparently, effects of seeding did not persist beyond the day of seeding. (Crouse-Arizona)

THE NILE IN THE SUDAN,
Khartoum Univ. (Sudan).
L. Berry, and A. J. Whiteman.
Geographical Journal Vol 134, PT 1, 1968, p 1-37. 6 tab, 19 fig, 52 ref.

Descriptors: *Geomorphology, *Geographical regions, *River systems, *Arid climates, *Stratigraphy, Geologic investigations, Evaporation, Geologic formations, Hydrogeology, Geologic mapping.
Identifiers: *Physical geography, *Geography, *Nile, Sudan, Egypt, Ethiopia, Africa.

Many scientists have studied the Nile--a main source of water for the agriculture of arid Sudan and Egypt. However, its physical history is little known, since most of the work has been concentrated on Egyption stratigraphy and denudation chronology. In this study the authors recognize four major sections, each of which is considered separately: the Blue Nile Basin, the Victoria and Albert Nile, the White Nile or Bahr el Abiad Basin, and the Main Nile Basin. The authors have conducted extensive field work and their findings, together with a critical review of pertinent literature, lead to the conclusion that sections of the Nile had their origins in Late Cretaceous times or earlier. The present Nile, then, is a complex formed by chance linkage of several basins with different structural and erosional histories. It is hypothesized that in drier times such as occurred in the head waters of the Blue Nile during periods of the Pleistocene, the waters would not have reached the White Nile or the Main Nile, but would instead have spread out and been lost in the arid Sudan. Tentative denudation and depositional chronologies are presented. (Crouse-Arizona)

WATER USE AND MANAGEMENT OF PONDEROSA PINE IN NORTHERN ARIZONA,
Arizona Univ., Tucson. Dept. of Watershed Management.
W. L. Russel and J. L. Thames.
Progressive Agriculture in Arizona, Vol 20, No 5, Sep-Oct 1968, p 10-11. 2 fig.

Descriptors: *Watershed management, *Arid lands, *Soil-water-plant relationships, *Water yield improvement, *Forest management, Arizona, Clear-cutting, Evapotranspiration, Water loss, Soil moisture, Pine trees, Ponderosa pine trees, Moisture content.

Principle sources of water for arid-land agricultural and urban valleys of Arizona are the high elevation ponderosa pine forests. Sound management of these watersheds requires knowledge of the water use and the potential for improving water yield of this species. Three study sites were used: a natural second growth pine plot with about 150 square feet basal area, one plot thinned to 40% of the original volume of pine growth, and a third clearcut with remaining vegetation killed chemically. There was

an approx. 80% difference in water loss between natural and clear-cut sites. The difference between natural and thinned plots was only about 20% of the difference shown on the clear cut. Water savings on the thinned area were not proportionate to the volume of timber removed. Results indicate that clear-cutting practices similar to West Coast block cuts would be advantageous from the standpoint of water yield. (Crouse-Arizona)

REPORT ON EVAPORATION CONTROL ON STOCK TANKS, RESERVOIRS,
Arizona Univ., Tucson. Water Resources Center.
C. Brent Cluff.
Progressive Agriculture in Arizona, Vol 19, No 2, p 4-5, Mar-Apr 1967. 4 fig.

Descriptors: *Evaporation control, *Monomolecular films, *Reservoir evaporation, Arizona, Water costs, Costs, Application equipment, Seepage.
Identifiers: *Evaporation control devices, *Rafts, Dispensers.

Methods for applying monolayer alcohols to reduce evaporation losses from stock ponds and small reservoirs in Arizona were tested. The most efficient was a wind operated dispenser. Even with this machine, costs per thousand gallons saved were over $3.50 for tanks up to one acre in size. The cost did not drop below $1.00 per thousand gallons unless the reservoir surface exceeded 15 acres. Several types of floating plastic rafts were found to be very effective in controlling evaporation losses. The most efficient had costs per unit lower than most domestic water supplies. RESULT OF CLOUD SEEDING EXPERIMENT AT DELHI AS ASSESSED BY RADAR,
Inst. of Tropical Meteorology, Poona (India).
R. N. Chaterjee, K. R. Biswas, and Bh. V. Ramana Murty.
Indian J Meteorol and Geophys, Vol 20, No 1, p 11-16, Jan 1969. 6 p, 6 tab, 6 ref.

Descriptors: *Cloud seeding, *Radar, Microwaves, Rain, Monsoons, Precipitation (Atmospheric), Seasonal, Instrumentation, Analytical techniques, Rain gages.
Identifiers: *India.

The result of cloud-seeding experiments conducted in the Delhi, India, area from 1961 to 1966 were examined by using a high-power microwave radar measuring areal echo coverage and echo height of rain cells. The trend of the result is positive on the basis of areal echo coverage, and negative on the basis of mean echo heights. However, as the assessment made is only qualitative in nature, it does not confirm that the rain over the area is increased by seeding by the specific amount indicated by the analysis. (Gabriel-USGS)

WEATHER MODIFICATION: LAW AND ADMINISTRATION,
Colorado Univ., Boulder.
James N. Corbridge, Jr., and Raphael J. Moses.
Natural Resources Journal, Vol 8, No 2, p 207-235, Apr 1968. abt 150 ref.

Descriptors: *Weather modification, *Legal aspects, *Administration, Legislation, History, Administrative agencies, United Nations.
Identifiers: Supra-national administrative system, Powers and responsibilities.

The article evaluates the present scientific and legal situation of weather control. Section I summarizes the historical development of weather modification. Sections II, III and IV discuss the development of private law doctrines and existing and proposed legislation. Existing law has evolved around property rights and remedies for the invasion of these rights. Section V demonstrates the need for a different legal approach. The first need is for establishment of a central administrative agency to supervise all weather modification activity in each country. This agency should register and license operators, impose controls on operation, require assurance of financial responsibility in the event of damage, and collect and disseminate information. Section VI analyzes possible legal and administrative solutions. Models include the Atomic Energy Act, the U.N. Committee on Peaceful Uses of Outer Space, the European Space Research Organization (ESRO/CERS) and the European Organization for the Development and Construction of Space Vehicle Launcers (ELDO/CECLES). The United Stations is proposed as a locus for an international, supra-national system of licensing, inspection and reporting. (Gossen-Chicago)

3C. Use of Water of Impaired Quality

PRELIMINARY STUDY OF A DESALTING POWER INDUSTRIAL COMPLEX IN ISRAEL,
Israel Atomic Energy Commission, Tel Aviv; and Water Planning for Israel Ltd., Tel Aviv.
J. Adar, D. Caplin, G. Frank, and D. Tavory.
Preprint of Paper SM-113/10 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 30 p, 4 fig, 4 ref.
Identifiers: *By-product economics, *By-product manufacturing processes, *Electrochemonuclear systems, *Israel, Dual-purpose plant, Economic evaluations, Energy costs, Feasibility study, Industries, Nuclear energy sources, 3000 plus MW (T) reactors, 51-250 MGD plant.

A dual-purpose plant will be needed in Israel in the middle 1970s to add some 300 MW (E) and 150 mgd to the national electricity and water grids. This study examines the profitability of combining with the dual-purpose plant an industrial complex fed by the low-cost incremental power (either electricity or low-pressure steam) of the larger reactor that would be required. The study includes two parts. (1) Incremental costs of power are estimated. Use of us light-water reactors of 2370 and 3300 mwt (or combination of both) is considered. Depending on size and number of reactors and on different steam cycles chosen, amounts of incremental electricity and low-pressure steam available for industrial complex vary between 118 to 930 mwe and 0 to 3.95 million lb/hr. Depending also on the different fixed charge rates considered, costs vary between 1.82-5.5 mill/kwh and 0-76 cents/mbtu. (2) A preliminary survey of process industries (chemical and metallurgical) is made. Processes were selected according to market possibilities for products or derivatives, preference for utilization of local raw material and/or intermediaries, the advantage of processing in Israel certain minerals or mineral concentrates. Effects of basic industries considered on the overall economic development of Israel is reviewed.

DUAL-PURPOSE NUCLEAR POWER PLANT WITH INCORPORATED PRODUCTION OF SALT,
Tokyo Inst. of Tech., (Japan); and Asahi Chemical Industry Co. Ltd., Tokoyo (Japan).
H. Kakihana, and Y. Tsunoda.
Preprint of paper SM-113/11 presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 12 p, 10 fig.
Identifiers: *By-product economics, *By-product manufacturing processes, Chemical by-product, *Dual-purpose plant economics, Electrochemonuclear systems, Japan, Membrane processes, Multipurpose plant, Multipurpose plant economics, Scale prevention.

Since Japan imports all its industrial salt, it is desirable to salvage brine from evaporation, concentrating it by electrodialysis and evaporating it. One overall plan for such utilization of seawater is discussed. This process is characterized by the use of a special type of anion and cation exchange membranes in the electrodialysis, incorporating it into the evaporation step of a dual-purpose nuclear power plant. Scaling in the heat exchanger of the evaporator is greatly reduced, making the distillation operation easier and less expensive. In addition to production of electric power, fresh water and industrial salt, if the plant is large enough five other products may be manufactured - magnesium hydroxide, chlorine, glaubers salt, potassium chloride, gypsum, and hydrogen.

ECONOMIC CONSIDERATIONS OF NUCLEAR ENERGY CENTRES FOR THE PRODUCTION OF CHEMICALS FROM SEA SALT IN DEVELOPING COUNTRIES,
United Nations Industrial Development Organization, Vienna (Austria).
P. M. Terlizzi.
Preprint of Paper SM-113/13 presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 20 p, 5 fig, 2 ref.
Identifiers: *Agro-industrial complexes, *Chemical production, *Nuclear energy sources, By-product economics, By-product manufacturing processes, Economic evaluations, Electrochemonuclear systems, Energy sources, Feasibility study.

The economics of production of chemicals from sea salt in developing countries utilizing nuclear fuel system is reviewed. The use of selected nuclear systems versus solar evaporation techniques, freezing, and geothermal resources as well as the level of nuclear fuel system sophistication which could possible be utilized to economic advantage are discussed in terms of technology, investment, personnel requirements and marketing economics of chemicals produced.
W70-01734

APPLICATION OF THE HTGR-CCGT SYSTEM IN DUAL-PURPOSE NUCLEAR POWER PLANTS,
Hoterv, Budapest (Hungary).
J. Halzl, Z. Szabo, L. Szucs, and M. Torma.
Preprint of Paper SM-113/14 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 26 p, 15 fig, 4 ref.
Identifiers: *Gas turbines, *High-temperature gas-cooled reactors, Aluminum, Dual-purpose plant, Electrochemonuclear systems, Energy sources, Flowsheets, Heat balance, Heat exchangers, Heat recovery, Heat transfer, Nuclear energy sources, Thermodynamics, Turbines.

The use of the high-temperature gas-cooled reactor closed-cycle gas-turbine (HTGR-CCGT) for the simultaneous supply of heat and electricity and its application to alumina-aluminum producing industrial complexes and to water desalination is explored. The influence of heat exchanger costs on the overall economy of the CCGT system is emphasized. In order to reduce costs it is suggested that mercury in specially designed equipment be used as heat-transmittent medium. Solutions of several heat exchanger design problems are presented, with several diagrams for the dimensioning of high-efficiency plate fins, taking into account both the temperature variation of the temperature field, existing in the gas flow, and the heat conduction of the fin, also in the direction of the flow.

APPLICATION OF NUCLEAR REACTORS IN THE ALUMINA AND ALUMINUM INDUSTRY,
Hoterv, Budapest (Hungary).
J. Halzl, G. Sigmond, Z. Szabo, and M. Torma.
Preprint of Paper SM-113/15 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 15 p, 5 fig, 2 ref.
Identifiers: *Aluminum, *Economic evaluations, *Multipurpose plant, *Multipurpose plant economics, Chemical production, Elec-

trochemonuclear systems, Energy sources, Nuclear energy sources.

The potentialities of dual-purpose nuclear power plants in the alumina-aluminum industry are analyzed. Results are summarized of economy calculations both for the back-pressure power plant supplying heat and electricity for an alumina plant only and for the power plant supplying both the alumina plant and the aluminum shelter. The calculations were done in terms of the capacity of the alumina plant using the following parameters - (A) rate of amortization, (B) power credit, (C) cost of fossil fuel, and (D) temperature level of heat demand. Nuclear energy supply variants were based on the PWR reactor but for big alumina plants and for the combined supply of the alumina plant and the aluminum smelter, the application of AGR reactors was also investigated.

POSITIONS OF COMPETITION BETWEEN WATER OBTAINED BY DESALINATION AND NATURAL RESOURCES,
Commissariat a L'Energie Atomique, France.
J. Gaussens.
Preprint of Paper SM-113/19 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 12 p, 5 fig.
Identifiers: *Economic conditions, *Water utilization, Base-load, Economic evaluations, Peaking power, Water sources.

The planning of a seawater desalting plant in a given region involves careful consideration of local fresh water supply and demand. In many cases, a thorough study of the natural resources available reveals that desalination is not needed. In other cases natural resources and desalination systems can be complementary, with the one contributing to the peak demand and the other to the base load. This analysis makes it possible to classify the main consumer regions according to certain economic criteria which define their suitability for the use of desalination processes. (In French)

CONTRIBUTION TO THE ECONOMIC STUDY OF MULTIPLE-PURPOSE PLANTS FOR POWER GENERATION, SEA WATER DESALINATION AND INDUSTRIAL CHEMICAL PRODUCTION,
Groupement d'Etudes de Dessalement Des Eaux Salees, Paris (France).
R. Douvry, and P. E. Dorges.
Preprint of Paper 113/22 Presented at IAEA Symp Nucl Desalination, Madrid, Spain, Nov 18-22, 1968. 31 p.
Identifiers: *Electrochemonuclear systems, *Multipurpose plant, Chemical by-products, Chemical production, Dual-purpose plant, Dual-purpose plant economics, Economic evaluations, Fertilizer, Multipurpose plant economics.

Optimization of dual-purpose plants results in production of considerably more electricity than can be used in many countries which can utilize the fresh water production. Therefore, association of these units with large power-consuming industries becomes potentially profitable, and it is possible to plan multiple purpose plants producing electricity, fresh water, industrial chemicals, fertilizers and electro-metallurgical goods. In industrialized countries output from these plants can be marketed in the area produced, but in other countries the output must be sold for export, either as semi-finished products or as processed raw material. This study considers the various products which can be processed in triple-purpose plants, both in the general case and at particular geographical locations. (In French)

ENERGY-INTENSIVE AND HEAT-INTENSIVE PROCESSES FOR A NUCLEAR ENERGY CENTER,
Oak Ridge National Lab., Tenn.
J. M. Holmes.
In abundant Nuclear Energy, Proc Symp Gatlinburg, Tenn, Aug 1968. p 29-43, 1 fig, 6 tab, 24 ref. AEC Symp Ser 14 (CONF-680810) 1969.
Identifiers: *Agro-industrial complexes, *By-product manufacturing processes, *Nuclear energy sources, *Process heat, By-product economics, Chemical by-products, Chemical production, Electrochemonuclear systems, Energy costs, Energy sources, Fertilizer, Multipurpose plant.

Chemical and metallurgical industries are large energy consumers with increasing power demands and significant sensitivities to changes in electricity prices. The major categories considered for installation at nuclear energy centers include (1) balanced fertilizers, (2) metals, such as aluminum, iron, steel, and magnesium, (3) plastics, and (4) brine chemicals. Other energy-intensive systems that may show promise include waste-water treatment, electric railways, high-temperature process heating, urban space heating, and several recently developed electroorganic processes. For economic utilization of the power from a 1000 MW (E) nuclear reactor, a number of the proposed systems would have to be combined into a complex.
W70-01739

A BLEACHED STRAW PULP MILL FOR AN AGRO-INDUSTRIAL COMPLEX,
Parsons and Whittemore, Inc., New York.
J. N. McGovern.
IN Abundant Nuclear Energy, Proc Symp Gatlinburg, Tenn, Aug 1968. p 205-18, 2 fig, 6 tab, 8 ref. AEC Symp Ser 14 (CONF-680810) 1969.
Identifiers: *Agro-industrial complexes, *By-product manufacturing processes, *Nuclear energy sources, *Process heat, By-product economics, Energy costs, Energy sources, Multipurpose plant.

The size and type of a hypothetical pulp mill to be part of an agro-industrial complex and to use residual wheat straw are developed. The choice of a pulping process is discussed, and process and material flows for the resultant 500 ton/day bleached sulfate pulp mill are shown. The mill would use power, heat, and water from the complex. The properties of short-fiber straw are compared with those of wood fibers, and a promising market for the straw pulp in the manufacture of book paper in developing countries is indicated. Plant-site factors are mentioned briefly. Capital requirements for the hypothetical mill are estimated at $60 to $65 million. It is considered that the hypothetical mill could be practical.
W70-01740

MARINE CHEMICAL RECOVERY,
Oak Ridge National Lab., Tenn.
W. C. Yee.
IN Abundant Nuclear Energy, Proc Symp Gatlinburg, Tenn, Aug 1968. p 249-68, 10 fig, 12 ref. AEC Symp Ser 14 (CONF-680810) 1969.
Identifiers: *Agro-industrial complexes, *By-product manufacturing processes, *Nuclear energy sources, *Process heat, *Solar energy sources, Chemical by-products, Chemical production, Multipurpose plant.

An economic analysis is made of several possible salt complexes that recover chemicals from the brine discharge of a nuclear desalination plant producing 100 MGD of fresh water with a seawater concentration factor of 2. Primary product recovery involves using solar energy at an arid desert site to recover sequentially gypsum, salt, potash, and magnesium chloride by fractional crystallization. Secondary product production involves using electrical and steam energy from the desalination plant to obtain cement and sulfuric acid, caustic soda and chlorine, and magnesium metal. Caustic soda and chlorine (as hydrochloric acid) can be used to remove bicarbonate ions from seawater prior to fresh-water production. Land requirements for solar evaporation are reduced by the availability of evaporator effluent as a starting material. The utilization of 3% of the brine discharge (2 x seawater) would consume 400 MW (E) of electric power, would require a capital investment of $84 million, would generate an income of $40 million, and would have a break-even power cost of 5.5 mills/kwhr at a 10% cost of money. Seawater treatment by the caustic-hydrochloric acid method would compete with the conventional sulfuric acid method of treatment at a power cost of 4 mills/kwhr when sulfur costs $50/ton.
W70-01742

THE CHEMICAL UTILIZATION OF WATER-DESALINATION RESIDUES,
United Nations Industrial Development Organization, Vienna (Austria).
N. K. Grigoriev.
In Proc Panel, Value to Agriculture of High-quality Water from Nuclear Desalination, Vienna 1967, p 65-74. 3 tab, 8 ref. (IAEA STI/PUB/210, 1969). Was Paper PL-264/2 at meeting.
Identifiers: *By-product economics, *Chemical by-products, By-product manufacturing processes, Chemical production, Economic evaluations.

Seawater contains many salts, and this paper mentions several publications describing the industrial potentialities. A model plant is then described for recovering chemicals from water-desalination residues. The suggestion is that seawater be chlorinated, filtered and frozen. The residue after separation of ice is treated with gypsum and cooled to a lower temperature to yield sodium chloride, potash and bromine. Subsidiary processing would yield caustic soda, chlorine, hydrogen, lime, magnesia, hydrochloric acid and other products. Costs are quoted and the value of the fresh water is estimated at 10 cents/1000 gal.
W70-01743

THE DESIGN OF WATER SUPPLY SYSTEMS BASED ON DESALINATION.
United Nations, New York.

ST/ECA/106, 1968. 64 p, 6 tab, 8 fig, 3 ref.
Identifiers: *Economic evaluations, *Feasibility study, *Water utilization, Capitalized costs, Distillation processes, Fixed charge rate, Interest, Investment (Fixed), Operating costs, Plant availability, Water costs estimate, Water sources, Water storage.

Since the design of a water supply involving desalination is strongly influenced by local conditions, it is recommended that cases be analyzed individually. The major system variables include the number of units and the total capacity of desalination to be installed and amount and type of storage to be installed. Knowledge is needed of (1) demand characteristics - existing and expected future levels, including details of short-term and seasonal variations, (2) the types and capacities of storage which can be made available locally and the costs of these facilities, and (3) the likelihood and duration of periods of downtime to which any desalination plant configuration may be subject. Three types of situations have been considered (1) desalination as the sole source of water supply, (2) desalination in conjunction with ground-water supplies, and (3) desalination in conjunction with surface-water supplies. A narrative discussion of the above factors is given and an appendix covers sample calculations for the various items considered.
W70-01744

POWER - IS IT THE KEY TO FOOD SUFFICIENCY IN INDIA,
California Univ., Davis.
P. R. Stout.
Bull At Sci 24 (9), 1968, p 26-28.
Identifiers: *Agriculture, *Fertilizer, *Land utilization, *Water utilization, Agro-industrial complexes, Energy sources, India, Nuclear energy sources.

Food sufficiency can be achieved and maintained in India if adequate sources of low-cost energy can be established quickly. But power must be made

available to pump water out of the ground for irrigation and to manufacture nitrogen fertilizer. These energy-consuming farm inputs would enable Indian farmers on the Indo-Gangetic plan to grow high-yield cereal grains during the winter dry season, when good lands now lie idle. Nuclear energy appears to be the quickest and cheapest means of providing this electrical power. Power levels would have to approach the energy inputs required by intensive cultivation practices in the worlds food-sufficient, industrialized nations. One reactor, providing power for irrigation and for the manufacture of 352,000 tons of fixed nitrogen, makes it possible to grow an additional 12.3 million tons of food grain. Two such units would be sufficient to fill Indias estimated 1973 gap in food grain of 23 million tons. A third unit, added by 1978, a fourth in 1983, and a fifth in 1988 would be required to keep the gap closed. A sixth unit by 1990 would fill the minimum shortage, predicted for that time, of 72 million tons.
W70-01745

ECONOMIC CONSIDERATIONS IN INTRODUCING DESALTED WATER INTO AGRICULTURE,
Water Commission of Israel, Tel Aviv.
E. Dlayahu.
In Proc Panel, Value to Agriculture of High-quality Water from Nuclear Desalination, Vienna 1967, p 93-104. 9 ref. (IAEA STI/PUB/210, 1969). Was Paper PL-264/3 at meeting.
Identifiers: *Agriculture, *Economic evaluations, *Water utilization, Ground rules, Israel, Land utilization.

Technological advances of recent decades have made large-scale desalination technically possible. The remaining obstacle to such development is economic. The testing ground of economic feasibility lies in agriculture, the major and marginal consumer of water. Criteria are discussed here for determining economic feasibility of using desalted water in agriculture, drawing on the experience of Israel for illustration. Topics dealt with include water costs, prices and subsidies, methods of estimating the value of irrigation water, economic and agro-technical problems in the large-scale use of desalted water, and quantity and quality as factors determining the value of desalted water. The following conclusions are drawn - with current techniques, a gap still exists between costs and benefits. Large plants of the future offer prospects of internal economics, but must face external diseconomics of scale. Desalination offers the best prospects, economically, in arid zones requiring perennial irrigation water. Greater economic benefits may be expected from water quality than from quantity. Best prospect for development in the near future lies in continued research and effective exchange of information, rather than in artificial stimulation by direct subsidization.
W70-01747

SOME CONSIDERATIONS OF THE VALUE TO AGRICULTURE OF HIGH-QUALITY WATER FROM NUCLEAR DESALINATION,
Food and Agriculture Organization of the United Nations, Rome (Italy).
H. G. F. Kreutzer.
In Proc Panel, Value to Agriculture of High-quality water from Nuclear Desalination, Vienna, 1967, p 77-92. 8 tab, 8 ref. (IAEA STI/PUB/210, 1969). Was Paper PL-264/14 at meeting.
Identifiers: *Agronomy, *Water costs estimate, *Water utilization, Agriculture, Land utilization.

The cost of water from nuclear desalination plants is still too high in comparison with what farmers pay at present for irrigation water from conventional sources. For the time being there seems to remain a very wide field of research work concerning the exact determination of water requirements under various conditions, the breeding and selection of salt-tolerant plants, which guarantee yields that are almost as high as those obtained under normal conditions, the improvement and application of the most advanced irrigation techniques, and the control of evaporation and seepage losses surface-water storage. There seems to exist only a few possibilities of making use of the power produced in the context of the desalination process, as agriculture itself can only undertake a very small part of it. To make the desert bloom, irrigation needs tremendous quantities of water at a low cost at the irrigation site. In view of the rapid development in this fairly new field of experimentation, it is hoped that further experiments, or even a breakthrough, may allow the food and agriculture organization to recommend its widespread application to agriculture.

THE ROLE OF NUCLEAR ENERGY IN DESALTING WATER FOR AGRICULTURE,
Oak Ridge National Lab., Tenn.
R. P. Hammond.
In Proc Panel, Value to Agriculture of High-quality Water from Nuclear Desalination, Vienna 1967, p 9-22. 4 tab, 4 fig. (IAEA STI/PUB/210, 1969). Was Paper PL-264/18 at meeting.
Identifiers: *Agriculture, *Economic evaluations, *Nuclear desalination, AEC sponsored, Energy sources, Heat transfer improvements, Land utilization, Nuclear energy sources, Water costs estimate, Water utilization.

The great importance of energy in the productivity of agriculture has only recently been recognized. Since the easily cultivable land in the world is fully utilized, the needs for more food will have to be met by increasing the output from present acreage and by bringing water to land which is now too dry for farming. Both methods require energy, in the form of fertilizer, cultivating power, insecticides and herbicides, pumps, and desalting of seawater. In many parts of the earth, nuclear energy is already the cheapest available form of large energy source, and the advent of the breeder reactor will lower cost still more. A look at the fuel resources available for breeder reactors shows that they are as inexhaustible as the water of the ocean. Since agriculture will need very large amounts of energy, especially for desalting seawater, the very size of the installations will help to reduce the unit cost of energy. Besides cheap energy, water production requires low-cost evaporators, and important breakthroughs have been made in the technology of evaporator design. One of these is the use of double-fluted vertical tubes, which transfer heat more cheaply than conventional tubes. Other improvements are concerned with the use of concrete construction and scale control.
W70-01749

THE NUCLEAR-POWERED AGRO-INDUSTRIAL COMPLEX,
Oak Ridge National Lab., Tenn.
R. P. Hammond.
In Proc Panel, Value to Agriculture of High-quality Water from Nuclear Desalination, Vienna 1967, p 31-64. 15 tab, 10 fig. (IAEA STI/PUB/210, 1969). Was Paper PL-264/19 at meeting.
Identifiers: *Agro-industrial complexes, *Economic evaluations, AEC sponsored, Agriculture, Capitalized costs, Chemical production, Fertilizer, Land utilization, Nuclear energy sources, Water costs estimate, Water utilization.

A study team of expert consultants and scientists of the Oak Ridge National Laboratory is attempting to determine, technically and economically, what can be accomplished by using low-cost nuclear energy under optimum conditions for desalting seawater and for providing industrial power. An agro-industrial complex centered on two large reactors can produce water to grow food for several million people and can supply power to industries producing fertilizer and other electrochemical products. Selected crops and industrial products, selling at current world prices, can produce a return on investment estimated to be in the range of 10 to 20% per year. Total capital costs are estimated between 500 to 1500 million dollars, depending on size and other variables. Information has been developed for industrial complexes without desalting and for various sizes of farming areas up to about 200,000 acres in summer and 280,000 acres in winter using the output of a 1 BGD desalination plant. A town of 30,000 to 60,000 people is required for workers, their families, and supporting services and is included in cost estimates. Results of the work are encouraging.
W70-01750

VALUE OF WATER USED FOR SUPPLEMENTAL IRRIGATION IN ENGLAND AND WALES,
Ministry of Agriculture, Fisheries and Food, London (England).
C. N. Prickett.
In Proc Panel, Value to Agriculture of High-quality Water from Nuclear Desalination, Vienna 1967, p 125-44. 9 tab, 10 ref. (IAEA STI/PUB/210, 1969). Was Paper PL-264/9 at meeting.
Identifiers: *Agriculture, *Water costs estimate, *Water utilization, Capitalized costs, Land utilization.

The paper gives data concerning the marginal costs and returns attributable to supplemental irrigation in the humid climatic conditions of England and Wales. Costs are divided into internal and external costs. Internal costs are those incurred within the farm boundary for receiving, storing, and distributing the water to the crops. External costs are water charges for abstraction from surface or groundwater sources, or charges for a piped supply from the general public system. Some theoretical estimates are also made of the external costs involved in supplying and distributing water to a number of farms in a designated irrigation area. For comparison with the costs, estimates are given of the likely effects of irrigation in terms of increased yields and increased gross margins per acre-inch of water applied. In making comparisons allowance would need to be made for the increased costs if desalted water were used. Comparisons indicate that there is little scope for use of desalted water for irrigation in England and Wales, with a possible exception of the irrigation of high-value crops in an area immediately adjoining a generating station.

In Proc Panel, Value to Agriculture of High-quality Water from Nuclear Desalination, Vienna 1967, p 111-23 (IAEA STI/PUB/210, 1969). Was Paper PL-264/4 at meeting.
Identifiers: *Agriculture, *Spain, *Water costs estimate, *Water utilization, Capitalized costs, Land utilization.

A prerequisite to the study of agricultural applications of water from nuclear desalination plants is a knowledge of the economic value of the water. Owing to the lack of rainfall in arid countries, water may be considered as the main factor governing agricultural production and its economic value, up to the maximum, may be arrived at by crediting the entire increase in production achieved through the use of irrigation water to that factor alone. There is also another, minimum value, arrived at by adding the annual cost of the implementing the project and the cost of operating the works and facilities. The paper outlines methods for calculating such values, as well as an additional, weighted, value obtained by attributing to the water only part of the savings achieved. There follows an itemization of the prices currently paid by Spanish farmers for irrigation water in valleys where the commodity is scarce and in those where it is abundant, together with indications of the prices they might have to pay, depending on circumstances, for high-quality desalted water.

VALUE TO AGRICULTURE OF HIGH-QUALITY WATER FROM NUCLEAR DESALINATION.
International Atomic Energy Agency, Vienna (Austria).

IAEA STI/PUB/210, 1969, Proc Panel, Vienna 1967. 278 p, 53 fig.
Identifiers: *Agriculture, *Land utilization, *Nuclear desalination, *Water utilization, Agro-industrial complexes, Agronomy, By-product economics, Economic evaluations, Feasibility study, Fertilizer, Nuclear energy sources, Reviews, Water costs estimate, Water sources.

Report of a panel organized by the IAEA and held in Vienna, from 30 October to 3 November 1967. The meeting was attended by 30 experts from 13 countries and 3 international organizations. The contents include papers in which some economic and agricultural aspects are discussed, such as the value to agriculture of high-quality water from nuclear desalination, cost of irrigation water, water quality and yield depression, tolerance of certain crops to salinity and agronomic aspects of irrigation with brackish water. A conversion table is given in an annex. Each paper is in its original language (19 English and 3 French) and is preceded by an abstract in English with one in the orginal language if this is not English. Discussions are in English.

SOME EFFECTS OF HIGH SALINITY ON GERMINATION AND EMERGENCE OF BARLEY,
Arizona Agricultural Experiment Station, Tucson.
T. J. Donovan, and A. D. Day.
Agronomy Journal, Vol 61, No 2, Mar-Apr 1969, p 236-238. 3 tab, 9 ref.

Descriptors: *Salinity, *Barley, *Plant growth, *Salt tolerance, *Germination, Arid lands, Soil-water-plant relationships, Saline soils, Seeds, Plant physiology, Arizona, Saline water.
Identifiers: Emergence (Seedlings).

Salinity frequently limits crop production in arid and semiarid agricultural regions. Thirty-nine barley varieties and lines were germinated in distilled water and in a water and sandy loam culture salinized to various concentrations. Most commercial varieties of barley had lower germination rates than did California Mariout and several saline tolerant strains developed by the USDA. Emergence in salinized soils was comparable to germination in water solutions. At moderate salinity levels most of the barleys performed well. At high salinity only the California Mariout and the salt tolerant strains were satisfactory. All the barleys were delayed in emergence in the highly saline media. In saline areas, tolerant barleys should be used, or if irrigation practices permit maintenance of low salinity during germination, higher salinity at later stages may not greatly affect yields. Laboratory methods are useful in screening barley varieties but should be supplemented by field trials. (Crouse-Arizona)

THE SELECTION OF NUCLEAR POWER AND DESALINATION PLANTS FOR AUGMENTING EXISTING WATER RESERVES,
Associated Nuclear Services, London (England).
H. A. Mathews, E. F. O. Masters, and F. K. Orde.
Preprint of Paper SM-113/51 Presented at IAEA Symp Nucl Desalination, Madrid, Nov 18-22, 1968. 33 p, ref, 5 fig.
Identifiers: *Water utilization, Dual-purpose plant, Energy sources, Fossil fuels, Load factor, Load following, Nuclear desalination, Nuclear energy sources, Water costs estimate, 0-50 MGD plant, 0-500 MW (E) reactors.

Whereas nuclear desalination is usually discussed and studied in the context of large capacities and high levels of utilization, implying base load requirements of high order of production, the possibility is considered here of utilizing reactors of the lower range of output to meet less favorable demands likely to occur before development of the ideal large-scale nuclear desalination plants. Ways are discussed of best employing reactors, power systems and water systems to obtain the most economic solution. It is suggested that the high availability characteristics of nuclear reactors may be exploited for this purpose. Attention is given to desirable characteristics of desalination plants and attainment of lower water costs.

THE ESTIMATION AND OCCURRENCE OF AGRICULTURAL DROUGHT,
Department of Agriculture, Ashburton (New Zealand). Winchmore Irrigation Research Station.
D. S. Rickard, and P. D. Fitzgerald.
J Hydrol (New Zeal), Vol 8, No 1, p 11-16, 1969. 6 p, 1 fig, 5 tab, 5 ref.

Descriptors: *Droughts, *Statistical methods, *Moisture deficit, Correlation analysis, Probability, Forecasting, Water shortage, Evapotranspiration, Soil moisture, Climatology, Estimating.
Identifiers: New Zealand.

Agricultural drought is defined as existing when the soil moisture in the root zone is at wilting point or below. The occurrence and distribution of agricultural drought was determined for 41 seasons in Mid Canterbury, New Zealand by calculating the day-by-day changes in soil moisture. This calculation was based on a Thornthwaite estimate of daily evapotranspiration modified to allow for the effect of decreasing soil moisture, and programmed for a digital computer. The average number of days of agricultural drought per season was 40, varying from none to 88. Approximately two-thirds of all drought days occurred during the summer months. The distribution of the longest drought in each season conforms to extreme-value theory; this showed that very severe periods of drought of 30 days or more could be expected once every 5 years. Highly significant correlations were obtained between seasonal nonirrigated pasture production and the number of days of agricultural drought. (Knapp-USGS)

DESIGN OF RECIRCULATING IRRIGATION SYSTEMS,
Agricultural Research Service, Kimberly, Idaho. Northwest Branch Soil and Water Conservation Research Div.
James A. Bondurant.
American Society of Agricultural Engineers, Transactions, Vol 12, No 2, 1969, p 195-198, 201. 6 fig, 3 ref.

Descriptors: *Runoff, *Water reuse, *Irrigation systems, *Surface irrigation, *Irrigation efficiency, Irrigation water, Idaho, Farm equipment, Operating costs, Irrigation engineering, Agricultural engineering, Equations, Arid lands, Design criteria, Pumping plants, Cost analysis, Flow rates, Water utilization.
Identifiers: *Recirculating irrigation systems.

Irrigation is necessary for many crops in arid or semiarid regions. When water costs are high or when it is desirable to control surface flow of silt and chemical contaminents in irrigation runoff water, a recirculation system may be considered. When irrigation runoff is collected it should be recirculated to a different field. Maximum improvement in efficiency is achieved by using stored runoff water to reduce stream size for cutback irrigation. A design example is given for an Idaho farm of 105 irrigated acres. A method is presented for determining amount and rates of runoff and time and size of cutback. Since annual operating costs depend to a large extent on design and efficiency of the pumping installation, great emphasis is placed on these factors. The necessary design data are listed and the equations for design calculations are given. (Crouse-Arizona)

COMPARISON OF INDEXES RELATING PLANT RESPONSE TO SOIL MOISTURE STATUS,
Agricultural Research Service, University Park, Pa. Northeast Watershed Research Center; and Hebrew Univ., Jerusalem (Israel). Dept. of Agriculture.
E. Rawitz, and D. I. Hillel.
Agronomy Journal, Vol 61, No 2, March-April 1969, p 231-235. 2 tab, 9 fig, 16 ref.

Descriptors: *Irrigation practices, *Soil-water-plant relationships, *Plant growth, *Soil moisture, *Crop response, Arid lands, Semiarid climates, Tensiometers, Growth chambers, Agronomy, Irrigation efficiency, Moisture availability, Timing, Crop production.
Identifiers: *Israel, *Soil suction, *Capillary suction index, Negev Desert.

Although plant response to soil moisture is affected by many factors, a single-value index is practical for determining timing and amount of irrigation. Comparisons of several indexes were made on the basis of dry matter yield of plants in growth chambers using soils from the arid Negev region of Israel. The mean maximum capillary suction index (using the minimum moisture content of each irrigation cycle) was the most practical. It is a relatively simple measure for a given soil where the affect of modifying factors is known or is fairly constant. The negative yield increment per unit suction decreased sharply to a fairly constant low value after a suction of about 1.5 bars. In the field such conditions are common during summer growing seasons in arid or semiarid Mediterranean climates. For practical field application it is suggested that suction be measured directly by tensiometer or calibrated electrical resistance units. (Crouse-Arizona)

FALL CHISELING FOR ANNUAL CROPPING OF SPRING WHEAT IN THE INTERMOUNTAIN DRYLAND REGION,
Agricultural Research Service, Kimberly, Idaho. Snake River Research Center; and Agricultural Research Service, Sidney, Mont. Northern Plains Soil and Water Research Center.
T. W. Massee, and F. H. Siddoway.
Agronomy Journal, Vol 61, No 2, p 177-181, Mar-Apr 1969. 2 tab, 5 fig, 12 ref.

Descriptors: *Dry farming, *Chiselling, *Soil-water-plant relationships, *Wheat, *Fallowing, Cultivation, Plant growth, Soil moisture, Agriculture, Semiarid climates, Idaho, Water utilization, Crop production, Great Plains, Moisture availability.
Identifiers: *Plots, Water use efficiency, Cropping.

Dryland agricultural production is largely limited by available water for plant growth. Various fallowing operations are practised to increase soil water supply for the next crop. An experiment was conducted in Idaho to test the effectiveness on wheat production of annual cropping, annual cropping with fall chiseling, and spring wheat-fallow rotation with chiseling after harvest. Monthly precipitation was a nearly uniform 2.5 cm., but cropping season precipitations averaged only 9.1 cm. In a 180 cm. soil depth annually cropped fall-chiseled plots averaged 21.3 cm. available stored water; cropped-fall chiseled-fallowed plots averaged 22.9 cm; and annually cropped plots averaged only 15 cm. COST-BENEFIT ANALYSIS OF PASTURE IMPROVEMENT IN THE ARID REGION OF RAJASTHAN,
Agro-Economic Research Centre, Vallabh Vidyanagar (India).
N. S. Jodha.
Annals of Arid Zone, Vol 7, No 2, p 250-257, 1968. 2 tab, 8 ref.

Descriptors: *Pasture management, *Range management, *Economic feasibility, *Arid lands, *Cost-benefit analysis, Interest rate, Cost-benefit ratio, Grazing, Range grasses, Contour furrows, Vegetation regrowth, Land reclamation, Data collections.
Identifiers: *Reseeding, *Rajasthan, India.

Nearly 315 of the state of North-Western Rajasthan (about 214,000 sq. kms.) is arid land. The sandy soils are susceptible to erosion and support only sparse vegetation. In spite of increasing competition for crop land, available grazing land decreased while livestock population increased over 50% in the decade from 1951-1961. In order to utilize the limited soil moisture to maintain productive grazing land, scientifically and economically sound range management practices are essential. Experimental studies have developed two methods that offer possibility of raising the productivity of grazing lands: range reseeding and contour furrowing (to conserve moisture). Cost-benefit analysis of both methods is presented using an interest rate of 9 percent. With an estimated project life of 15 years, reseeding had a cost-benefit ratio of 1:3.47, while contour furrowing had a ratio of 1:5 on a ten year basis. (Crouse-Arizona)

AUSTRALIA'S ARID RANGELANDS,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Land Research and Regional Survey.
R. A. Perry.
Annals of Arid Zone, Vol 7, No 2, p 244-249, 1968. 2 fig, 9 ref.

Descriptors: *Arid lands, *Range management, *Economic feasibility, *Grazing, *Resource development, Soil-water-plant relationships, Soil moisture, Erosion control, Simulation analysis, Ecosystems, Computers, Ranges, Land tenure, Rainfall, Sheep, Cattle.
Identifiers: *Australia.

Australia's arid lands are defined as those on which rainfall is not adequate for crop production. Seasonal distribution of rainfall, its reliability and evaporative potential together with total rainfall are considered in delineating the area where cropping is not economically feasible. Australia has some 2,2000,000 sq. miles which might be considered arid by the definition used. About half this area consists of sand plains or dune fields unsuitable for grazing. The remainder supports about 4.5 million cattle and 48 million sheep. An extensive system of management is used which gives efficient returns to capital. Carrying capacity must be adjusted in each area to obtain optimum sustained production from the limited available moisture. The land tenure system is unique: all land is owned by state governments and leased on long-term basis. The State retains power to influence land management to the extent that basic knowledge is available. The grazing industry operates in a delicate ecosystem that could easily be upset with irreversible deterioration. An objective of the grazing research program is knowledge of the functional relationships of the ecosystem so that grazing management experiments can be simulated in a computer. (Crouse-Arizona)

IMPROVING SEMIDESERT RANGES IN SOUTHERN ARIZONA, U.S.A. BY GRAZING MANAGEMENT AND SHRUB CONTROL,
Forest Service (USDA), Tucson, Ariz. Rocky Mountain Forest and Range Experiment Station.
S. Clark Martin.
Annals of Arid Zone, Vol 7, No 2, p 235-242, 1968. 2 tab, 2 fig, 12 ref.

Descriptors: *Semiarid climates, *Range management, *Weed control, *Mesquite, *Desert plants, Grasslands, Stocking, Grazing, Arizona, Forage grasses, Southwest U.S., Cacti, Rainfall, Shrubs, Soil moisture.
Identifiers: Burroweed, Perennial grasses.

The 50,000 acre Santa Rita Experimental Range in southern Arizona is representative of nearly 20 million acres of semidesert grass-shrub range in the southwestern U.S. The vegetation which can best utilize limited moisture supply to support economically feasible grazing is perennial grass. Without careful range management, the land is invaded by weed shrubs and small trees which use available soil moisture and permit only limited grazing. Shrubs may be controlled by chemicals or, under certain conditions, by fire. Chemicals applied by ground spray or by air will kill mesquite. When stocking was adjusted to utilize 40% of the forage, yields doubled in three years; when shrubs and mesquite were controlled, grass yields increased 3 1/2 times. When the grasses were allowed to occupy more of the root zone, they were able to utilize for forage production more of the soil moisture before it evaporated. (Crouse-Arizona)

WATER PRIORITY RIGHTS AND THEIR EFFECT ON FARM PLANNING IN THE SAN CARLOS IRRIGATION AND DRAINAGE DISTRICT IN CENTRAL ARIZONA,
Arizona Agricultural Experiment Station, Tucson.
Aaron G. Nelson, and P. Thomas Cox.
University of Arizona, Agricultural Experiment Station, Technical Bulletin 184, 1968. 48 p, 20 tabs, 4 fig.

Descriptors: *Arizona, *Irrigation districts, *Probability, *Economics, *Water allocation (Policy), Arid lands, Irrigated land, Water rates, Farm prices, Costs, Profits, Institutional constraints, Priorities, Indian reservations, Water storage, Pumped storage, Dams, Watersheds (Basins).
Identifiers: *San Carlos Irrigation and Drainage District (Ariz), *Gila River.

Water is the most limiting factor with which farmers operating in the San Carlos Irrigation and Drainage District in central Arizona must contend. Yet the institutional environment is such that they must make decisions without full knowledge of and only negligible control over their water supply. The objectives of this paper are to increase available knowledge of institutional constraints and reduce uncertainties of decision making. Priorities and apportionment of natural flow and pumped and stored water are described. Probabilities of receiving certain amounts of water in a given period are calculated. From those probabilities graphs were developed to show probable marginal gain and loss per water period for specified crops with different levels of costs and prices. (Crouse-Arizona)

USE OF CONTROLLED ENVIRONMENT FOR VEGETABLE PRODUCTION IN DESERT REGIONS OF THE WORLD,
Arizona Univ., Tucson. Environmental Research Lab.; and Sonora (Univ.) Hermosillo (Mexico).
Merle H. Jensen, and Marco Antonio Teran.
American Society for Horticultural Science, 66th Annual Meeting, Aug 20-22, 1969, Pullman, Washington, Paper Presented. 12 p, 5 tab.

Descriptors: *Greenhouses, *Arid lands, *Soil-water-plant relationships, *Irrigation efficiency, *Vegetable crops, Irrigation practices, Environmental effects, Fertilization, Plant diseases, Mexico, Calcium, Beaches, Leaching, Plastics, Pollen, Pest control, Nutrients, Planting management, Saline water, Sands.
Identifiers: *Controlled environment, *Sonora, Mexico, Gulf of California, Puerto Penasco.

The authors report on a pilot program to grow a variety of edible vegetables in a controlled environment on the arid coast of Sonora, Mexico at Puerto Penasco. Air-inflated plastic greenhouses are used

to minimize consumption of scarce fresh water and provide protection from insects and sandstorms. Beach sand is used as a medium after leaching to remove excess salts. Nutrients are supplied through the irrigation system. Air inside the greenhouse is circulated through a spray of seawater which maintains relative humidity close to 100%, and reduces fresh water irrigation requirements to a minimum. Yields were high - comparable to those of conventional greenhouses. Disease problems were limited to easily controlled fungus infection. (Crouse-Arizona)

THE GEZIRA SCHEME: A STUDY IN AGRICULTURAL DEVELOPMENT,
William A. Hance.
In: William A. Hance, African Economic Development, Rev ed, New York, Praeger, 1967, p 31-53.

Descriptors: *Arid lands, *Land tenure, *Irrigation operation and maintenance, *Marketing, *Agriculture, Diversion dams, Irrigation practices, Hydroelectric plants, Farm management, Clays, Social impact, Economic impact, Cotton, Multipurpose projects.
Identifiers: *Sudan, *Africa, *Nile River, *Gezira Scheme.

The Gezira Scheme which started in the 1920's, lies south of Khartoum, Sudan, between the White Nile and Blue Nile. The naturally arid land is irrigated by diversion from the Blue Nile. A total area of about 1,870,000 acres is involved, of which about 58 percent is irrigated each year. Principal crops are cotton and food and feed grains. Average tenancy is about 30 acres and is worked largely by hand methods. Most of the land is government owned but alloted to and worked by original residents of the area. It is worked under a partnership arrangement among tenants, government and public utilities which manages the water works, marketing and research and which offer managerial guidance. General economic and educational levels of tenants and hired help have been raised to a favorable level and needed revenues are derived by the government, although individual initiative has been limited by the partnership arrangement. The scheme has been copied elsewhere in Africa with varying degrees of success and offers at least one workable approach to agricultural development of the arid zones of Africa. (Crouse-Arizona)
W70-01823

BORON TOLERANCE OF TALL WHEATGRASS,
Department of Agriculture, Lincoln, Nebr.
Gerald E. Schuman.
Agronomy Journal, Vol 61, No 3, May-June 1969, p 445-447. 1 tab, 4 fig, 7 ref.

Descriptors: *Boron, *Wheatgrasses, *Arid lands, *Plant growth, *Toxicity, Germination, Nutrients.
Identifiers: *Boron toxicity, Nutrient culture.

Some of the unproductive arid lands of the western United States have less vegetation than actual rainfall might support because of high boron levels in the soil. Experiments were conducted with three varieties of tall wheatgrass in nutrient solutions with boron content ranging from 0 to 150 ppm. One variety, Alkar, was also tested in sandy loam. In the nutrient solutions the B level, which effected a 50% reduction in growth, ranged from 33 to 38 ppm. Growth of the Alkar variety in soil was reduced to 50% at a B level of 46 ppm in the saturation extract. The author concluded that tall wheatgrass may be economically feasible for reseeding arid land with boron levels as high as 35 ppm. Germination was not adversely affected by boron in the soil. (Crouse-Arizona)

PLANT DENSITY AND YIELD OF SUGAR BEETS IN AN ARID ENVIRONMENT,
California Univ., Davis. Dept. of Water Science and Engineering; and California Univ., Davis. Dept. of Agronomy.
Frank E. Robinson, and George F. Worker, Jr.
Agronomy Journal, Vol 61, No 3, May-June 1969, p 441-443. 5 tab, 1 fig, 20 ref.

Descriptors: *Sprinkler irrigation, *Arid lands, *Sugar beets, *California, *Crop production, Germination, Crop response, Spatial distribution, Plant populations.
Identifiers: Dry matter, Sucrose.

Use of sprinkler irrigation permits flexibility in spacing arrangements and density of plants. An experiment testing four different spacings of sugar beet plants was run to determine the yield of sucrose in relation to plant density per hectare of sprinkler irrigated arid land. The highest yield of sucrose with square grid spacing was obtained with approximately 100,000 plants per hectare. Maximum yield spacing for the sprinkler irrigated arid area tested was similar to that found in well watered European regions. (Crouse-Arizona)

SPRINKLER IRRIGATION IN ARIZONA,
Arizona Univ., Tucson. Dept. of Agricultural Engineering.
A. D. Halderman, and K. R. Frost.
Arizona University, Cooperative Extension Service and Agricultural Experiment Station, Bulletin A-56, Dec 1968. 30 p, 13 fig, 3 tab.

Descriptors: *Arid lands, *Arizona, *Sprinkler irrigation, *Irrigation design, *Irrigation systems, Economic justification, Initial costs, Operating costs, Temperature control, Frost protection, Agricultural engineering, Cost analysis, Irrigation efficiency.

Sprinkler irrigation is considered as a method of improving efficiency of water use by agriculture in arid Arizona. This bulletin is intended to supply growers with information needed to make decisions concerning installation of sprinkler irrigation systems. Advantages include possibilities of irrigating rough land; light, frequent irrigations for better soil moisture control; relatively uniform and efficient distribution; alleviation of soil erosion and excessive loss to deep percolation; more efficient field machinery operations; frost control; and fertilizer application. However, additional power is required to provide pressure and initial installation may be more costly. Diagrams, tables and discussion are presented to guide the operator in decisions on system design, selection of type of system, volume of water required, operation, and economics of sprinkler irrigation. (Crouse-Arizona)

BASIC PROBLEMS OF THE TRANSFORMATION OF NATURE IN CENTRAL ASIA,
Akademiya Nauk SSSR, Moscow. Institut Goegrafii.
I. P. Gerasimov.
Translation from Problemy Osvoyeniya Pustin, No 5, p 3-17, 1967. Soviet Geography: Review and Translation Vol 9, No 6, p 444-458, June 1968. 1 tab.

Descriptors: *Grazing, *Arid lands, *Soil surveys, *Irrigable land, *Agriculture, History, Range management, Soil types, Semiarid climates, Runoff, Saline soils, Resource development, Hydrologic cycle, Water balance, Land reclamation, Drainage, Geographic regions, Salt balance.
Identifiers: *U.S.S.R., *Central Asia, *Physical geography.

The author presents a broad view of the problems involved in rational expansion of irrigated agriculture and grazing in Central Asia to their full potential. Present investigations are of two types: historical and soil and physical-geographic studies. Historical research indicates that at one time 8-10 million ha. were irrigated at sometime in Central Asia, far more than at present. Assuming current technology, at least 10.2 million ha. in desert and semiarid regions of Central Asia are irrigable. Many soil types are involved, including large areas with salinity problems. Grazing lands that have permanent forage plants might support 25-30 million sheep - far more than present flocks. Dependable watering installations and better surveys of natural productivity of grazing lands are needed to meet this potential. The Institute of Geography has attempted to define problems requiring interdisciplinary research to achieve the full potential of Central Asia. (Crouse-Arizona)

BULKHEAD LINE: THE LIFELINE OF OUR COASTS,
Tom Adams.
In the Capitol, Vol 7, No's 9, 10, p 1-3, Sept, Oct 1969. 3 p.

Descriptors: *Florida, *Bulkhead line, *Landfills, *Water pollution, Coasts, Coastal engineering, Coastal structures, Shores, Shore protection, Land forming, Land reclamation, Land management, Land resources, Administration, Legislation.
Identifiers: Recommended legislation.

The bulkhead line is an imaginary line in a body of water beyond which no land filling is permitted. Bulkhead lines are important to Florida because haphazard filling can cause water pollution and the destruction of marine and bird sanctuaries. The Trustees of the Internal Improvement Fund manage Florida's coastal land resources. They have established a uniform policy on bulkhead lines based on the mean high water mark. The Trustees have set penalties for illegally filling coastal areas. However, permanent legislation is needed to establish bulkhead lines and construction setback lines along our coastlines. SURVIVAL OF QUERCUS TURBINELLA AND Q. EMORYI SEEDLINGS IN AN ARIZONA CHAPARRAL COMMUNITY,
Forest Service (USDA), Tempe, Ariz. Rocky Mountain Forest and Range Experiment Station.
C. P. Pase.
Southwestern Naturalist 14 (2):149-155, Oct 10, 1969.

Descriptors: *Chaparral, *Oak trees, *Succession, Effects, Competition, Growth stages, *Burning, Environmental phenology.
Identifiers: *Prescribed fire, Seedling establishment.

Naturally occurring seedlings of shrub live oak (Quercus turbinella) and Emory oak Q. emoryi are uncommon, but a moderate population was observed in August 1963 on chaparral strips burned 1 and 2 years previously. After 3 years, survival of shrub live oak seedlings was 26 percent, and Emory oak, 27 percent. Nearly all mortality was attributed to drought. It is hypothesized that rainfall is suitable for oak seedling germination and establishment only 1 year in 10. Critical moisture values suggested are 15 inches or more of October-March precipitation, followed by 10 inches or more of July-September rainfall. (Author)

4B. Groundwater Management

ARTIFICIAL RECHARGE TO THE SNAKE PLAIN AQUIFER IN IDAHO; AN EVALUATION OF POTENTIAL AND EFFECT,
Geological Survey, Washington, D.C.
R. F. Norvitch, C. A. Thomas, and R. J. Madison.
Idaho Dep Reclam Water Inform Bull No 12, Aug 1969. 59 p, 14 fig, 3 tab, 26 ref.

Descriptors: *Water resources development, *Artificial recharge, *Water management (Applied), *Analog models, *Idaho, Aquifers, Hydrogeology, Streamflow, Groundwater movement, Water quality, Water levels, Discharge (Water), Hydrologic data, Data collections, Water wells, Permeability, Transmissivity.
Identifiers: Snake River Plain aquifer (Idaho).

The major factors involved in using surplus water for artificial recharge of the Snake Plain aquifer in southern and southeastern Idaho are the availability of water, the effects of mixing on groundwater quality and aquifer properties, and the effects of artificial recharge on groundwater levels and discharge. About 5,100,000 acre-ft of water is recharged to the aquifer annually by irrigation. An average flow of about 1.3 million acre-ft or more

occurs at a rate of once every 2 yr. There probably will be no chemical-quality problems involved in large-scale recharge. A transient state, electric-analog model of the Snake Plain aquifer was constructed. Model predictions show that by recharging a total of 3.7 million acre-ft of water over a 10-yr period at 4 different places on the Plain, water-level rises of less than 1 to more than 5 ft, measured 21 months after recharge stopped, would occur. If water were added at 62,000 acre-ft per month for 3 continuous months at each place, once every 2 yr, over a 10-yr period, 3.3 million acre-ft would go into storage in the aquifer and 0.4 million acre-ft would flow out of the springs. (Knapp-USGS)

PROJECTIONS OF NET INCOME AND WATER USE IN PINAL COUNTY, ARIZONA,
Arizona Univ., Tucson. Dept. of Agricultural Economics.
William E. Martin, Thomas G. Burdak, and Robert A. Young.
Progressive Agriculture in Arizona, Vol 21, No 4, July-Aug 1969, p 3, 20. 1 tab.

Descriptors: *Agriculture, *Arizona, *Economics, *Net income, *Computers, Irrigation, Groundwater mining, Cost trends, Farm management, Linear programming, Analog computers, Digital computers, Arid lands, Water levels, Water table, Water utilization, Pumping.

Large-scale use of groundwater for irrigation in arid Pinal County of central Arizona has caused a rapid decline in water level. As the water level falls, pumping costs rise. The authors combined analog computer projections of the groundwater table made by the U.S. Geological Survey with a digital computer linear programming technique to obtain water use and cost projections based on the interrelated nature of agriculture and aquifer conditions. It was recognized that as pumping costs increase, farmers will change their agricultural activities. The conclusion was that while the water table will continue to decline, the rate will slow down in response to higher costs. Net farm income will decline gradually, with smaller farms most seriously affected. (Crouse-Arizona)

THE ORIGIN AND SPREAD OF QANATS IN THE OLD WORLD,
Texas Univ., Austin, Tex.
Paul Ward English.
American Philosophical Society, Proceedings, Vol 112, No 3, June 1968, p 170-181. 4 fig, 74 ref.

Descriptors: *Wells, *Underground structures, *Irrigated land, *Arid lands, Water rights, Water table, Social change, Construction costs, Tunneling, Institutional constraints, Water law.
Identifiers: *Qanats, *Armenia, *Persia (Iran), Arabia, North Africa, Central Asia, China.

The author reviews probable origin of the Qanat system more than 2,500 years ago in the region of Armenia and its spread to arid regions of Persia, Egypt, Arabia, North Africa, Central Asia, and even China. Qanats are gently sloping tunnels dug by hand down into an allovial fan until they intercept the water table. Water emerges in nearby lowlands, where it is used for irrigation and domestic purposes. In use over long periods, Qanats have influenced settlement patters and agriculture and have a complex set of customs that determine water rights. Although deep wells may be less costly to construct today, large numbers of existing Qanats exert a conservative force in support of continued existence of preindustrial social and economic conditions. BASE FLOW WELLS: RIO COBRE PROJECT, JAMAICA,
Humphreys (Howard) and Sons, Reading (England); and Water Research Association, Medmenham (England).
J. D. Williams, and A. Hunter Blair.
J Inst Water Eng, Vol 23, No 7, p 449-463, Oct 1969. 15 p, 6 fig, 2 tab, 6 ref.

Descriptors: *Conjunctive use, *Base flow, *Groundwater, *Karst, *Analog models, *Low-flow augmentation, Model studies, Water wells, Alluvial channels, Pumping, Springs, Water supply, Water resources development.
Identifiers: *Jamaica (BWI), Rio Cobre (Jamaica).

To augment the resources of Kingston and St. Andrew, Jamaica, an inexpensive groundwater scheme, the Rio Cobre project, involves the development of three groundwater sources. Use of one of these sources, Tulloch Spring, would reduce the river flow available to the Rio Cobre irrigation system. An electric analog model was constructed to verify that seasonal pumping from groundwater storage can maintain the river base flow and compensate for abstraction at the spring. After modelling historic data, the performance of several alternative groups of base flow wells was tested. River flows can be maintained without impairing other interests in the aquifer, and the valuable Tulloch source can be developed as part of the project in this manner. (Knapp-USGS)

4C. Effects on Water of Man's Non-Water Activities

REVERSE AND DIRECT RESERVOIR ROUTING METHOD SETS HIGHWAY GRADE,
Ministry of Public Works, Caracas (Venezuela).
Constantine Voutyras.
Civil Eng, Vol 39, No 10, p 56-58, Oct 1969. 3 p, 4 fig, 1 photo.

Descriptors: *Routing, *Streamflow, *Floods, *Stage-discharge relations, *Embankments, Hydraulic design, Weirs, Discharge coefficients, Drainage, Spillway crests, Highway effects, Water levels, Overflow.
Identifiers: Rating curves, Venezuela.

Combined overflows from the Orinoco and Apure Rivers in Venezuela produced unprecedented flooding in the vicinity of a highway that was under construction. The partially built embankment acted as a dam, and because the flood was without precedence, the drainage system designed for the highway proved inadequate. The problem of providing proper drainage was aggravated by a lack of topographic and hydrologic data for the area. Information was gathered on water levels, high water marks and topography in the vicinity. By treating the embankment as a broad-crested weir, a rating curve for the 2.5-km (1.6-mile) spillway was developed, and an outflow hydrograph constructed from stage-discharge relationships. Then, employing reverse routing methods, an inflow hydrography was established. Repeated routing of this hydrograph was used in developing one graph of water elevation and total waterway span, from which the total drainage waterway opening required to prevent overtopping of the road was determined. (Knapp-USGS)

5A. Identification of Pollutants

MICROPARTICULATES: ISOLATION FROM WATER AND IDENTIFICATION OF ASSOCIATED CHLORINATED PESTICIDES,
Ohio State Univ., Columbus. Dept. of Microbial and Cellular Biology.
R. M. Pfister, P. R. Dugan, and James I. Frea.
Science, Vol 166, No 3907, p 878-879, Nov 1969. 2 p, 1 tab, 7 ref. OWRR Grants A-006-OHIO and A-013-OHIO.

Descriptors: *Pesticide kinetics, *Lakes, *Adsorption, *Suspended load, Gas chromatography, Path of pollutants, Pesticide residues, Laboratory tests, Sampling, Analytical techniques, Chlorinated hydrocarbon pesticides.
Identifiers: Microparticulates, Gas-liquid chromatography, Thin-layer chromatography.

Microparticulates suspended in lake water were collected by continuous centrifugation and either examined directly or placed on a linear sucrose gradient. Total residue as well as fractions of the centrifuged gradient were extracted with hexane and examined by gas chromatography for the presence of chlorinated hydrocarbon pesticides. Hexane extracts of total residues were also examined by thin-layer chromatography. Lindane and endrin were shown, by gas-liquid chromatography and thin-layer chromatography, to be associated with microparticles. These and other pesticides appeared to be selectively associated with microparticles of different densities, when gas-liquid chromatography was used, although concentrations were below the detection limits required for confirmation by thin-layer chromatography. Samples taken at different times from different locations in Lake Erie revealed different associations with hexane-soluble electron-capturing compounds. (Knapp-USGS)

DUAL COLUMN AND DERIVATIVE TECHNIQUES FOR IMPROVED SPECIFICITY OF GAS-LIQUID CHROMATOGRAPHIC IDENTIFICATION OF ORGANOCHLORINE INSECTICIDE RESIDUES IN SOILS,
Wisconsin Univ., Madison. Dept. of Soil Science.
H. B. Pionke, G. Chesters, and D. E. Armstrong.
Analyst, Vol 94, No 1123, p 900-903, Oct 1969. 4 p, 2 fig, 1 tab, 8 ref. Contract No 12-14-100-8154 (41), Agricultural Research Service.

Descriptors: *Analytical techniques, *Gas chromatography, *Insecticides, DDT, Instrumentation, Water analysis, Pollutant identification, Soil chemistry, Soil water.
Identifiers: TDE, Methoxychlor.

Derivatives of organochlorine insecticides exhibiting column time values substantially different from those of the parent insecticides were obtained for TDE, methoxychlor, and DDT on treatment with 2% ethanolic potassium hydroxide, and for endrin and dieldrin with ethanolic concentrated hydrochloric acid; partial clean-up of soil extracts was achieved by the alkali treatment. The use of dual colums, namely DC-200 and diethylene glycol succinate, in conjunction with derivative formation, provided column time values sufficiently different for improved organochlorine insecticide identification with minimal additional effort. (Knapp-USGS)
W70-01692

INVESTIGATION OF ORGANIC POLLUTION OF SURFACE WATERS BY ULTRAVIOLET SPECTROPHOTOMETRY,
Hydraulic Research Inst., Ostrava (Czechoslovakia).
Miroslav Mrkva.
J Water Pollut Contr Federation, Vol 41, No 11, Part 1, p 1923-1931, Nov 1969. 9 p, 5 fig, 2 tab, 22 ref.

Descriptors: *Pollutant identification, *Water pollution, *Organic wastes, *Spectrophotometry, *Ultraviolet radiation, Pollutants, Water pollution sources, Sampling, Laboratory tests.
Identifiers: Ultraviolet spectrophotometry.

To determine the organic content of surface waters, several methods may be employed, including ultraviolet spectrophotometry. Assuming that surface waters consist mainly of readily degradable organics and other lignum substances, three groups of surface water classifications were proposed. Absorbance spectra for each of the three ranges were 220 to 245 millimicrons for clean waters; 220 to 280 millimicrons for rivers with high concentrations of lignum sulfonates; and 270 millimicrons for rivers which received additional waste products (phenol, etc.). Coefficients to convert absorbance to organic concentration are given. Experiments to confirm the proposed wavelengths were performed on the river Odra in the Central European region showed that spectrophotometry can be used to describe the dissolved organic matter in rivers. MAN-MADE CARBON-14 IN DEEP PACIFIC WATERS: TRANSPORT BY BIOLOGICAL SKELETAL MATERIAL,
Scripps Institution of Oceanography, La Jolla, Calif.; and Tata Inst. of Fundamental Research, Bombay (India).
B. L. K. Somayajulu, D. Lal, and S. Kusumgar.
Science, Vol 166, No 3911, p 1397-1399, Dec 1969. 3 p, 1 tab, 10 ref.

Descriptors: *Carbon radioisotopes, *Pacific Ocean, *Calcium carbonate, *Carbon cycle, *Fallout, Radioactive dating, Radioecology, Radiochemical analysis, Radioactivity effects, Tracking techniques, Sedimentation, Geochemistry.
Identifiers: Pacific Ocean carbon-14.

Calcareous particles present in Pacific waters at depths of 50 to 3500 meters were collected by filtering seawater through spongin matrix. The specific activity of carbon-14 could be measured in two of these collections from depths of 2300 and 3500 meters. The ratios of carbon-14 to carbon-12 correspond to values observed in surface waters in recent years as a result of the addition of manmade carbon-14, thus indicating that the calcareous particles resulted from recent biological productivity. The results are related to the mean settling rates and the sizes and dissolution rates of biogenic calcareous particles in transit through a seawater column. (Knapp-USGS)

THERMAL POLLUTION AS A FACTOR IN POWER PLANT SITE SELECTION,
Rice (Cyrus Wm.) and Co., Pittsburgh, Pa.; and Gurnham, Bramer and Associates.
P. V. Morgan, and H. C. Bramer.
Paper presented at the Cooling Towers Institute Meeting-1969. 22 p, 2 tab, 2 fig, 3 ref.

Descriptors: *Thermal pollution, Ecology, Powerplants, Temperature, Model studies.
Identifiers: Site selection, Dispersion studies.

Industry today must determine that present or projected effluents will meet the water quality criteria set for receiving streams. This is of particular importance insofar as thermal pollution in connection with electric power generation is concerned. Baseline ecological and engineering studies should be integral parts of site selections and should precede land acquisition or construction planning. The power industry should be continually acquiring data as a matter of self interest to guard against unfounded charges and to institute optimum, least-cost abatement measures. Simultaneous measurements of a biological, chemical and physical nature allow ecological judgements to be made. Other techniques include aerial surveillance with infrared and other photographic monitoring, hydrological measurements, dye dispersion studies, mathematical and physical modeling, data processing, and economic evaluations. Such problems require a true multi-disciplinary approach by a group of scientific and engineering specialists. (Upadhyaya-Vanderbilt)

BEHAVIOR OF NONCONSERVATIVE POLLUTANTS IN AQUEOUS ENVIRONMENTS,
Washington Univ., St. Louis, Mo. School of Engineering.
Ervin Y. Rodin.
J Water Pollut Contr Federation, Vol 41, No 11, Part 2, p R475-R481, Nov 1969. 7 p, 2 fig, 6 ref.

Descriptors: Water pollution effects, *Great Lakes, *Biodegration, *Reviews, Oxidation, Path of pollutants, Eutrophication, Mathematical models, Nutrients, *Water pollution sources.
Identifiers: Nonconservative pollutants.

A qualitative theory for the description of pollution concentration, buildup, and recovery levels is developed. Pollutants of a nonconservative type (i.e., organic matter, phosphates, etc.) are considered, and the Great Lakes are studied. Rainey's formulations are discussed and evaluated. The theoretical approach presented has the advantage over other methods because it is able to uncover the guiding principles of the process and because it can define effective pollutional levels. (Knapp-USGS)

SYSTEMS ANALYSIS FOR OPTIMAL WATER QUALITY MANAGEMENT,
Federal Water Pollution Control Administration, Edison, N.J.
Ethan T. Smith, and Alvin R. Morris.
J Water Pollut Center Federation, Vol 41, No 9, p 1635-1646, September 1969. 12 p, 2 fig, 2 tab, 3 ref.

Descriptors: *Systems analysis, *Mathematical models, *Optimization, *Water quality control, *Water resources development, Cost allocation, Estuaries, Cost-benefit analysis, Delaware River, Biochemical oxygen demand, Dissolved oxygen, Maintenance.
Identifiers: Uniform treatment.

A comprehensive study of the Delaware Estuary was undertaken in 1961 with the following objectives: (a) to develop methods of water quality management, (b) to determine the cause and effect relationship between pollution from any source and the deteriorated quality of water in the estuary and (c) to prepare a program for the improvement and maintenance of the water quality in the estuary was developed which embodied the cause and effect relationships and control programs based on cost allocation, cost minimization and zoned-optimization models. The optimization model of the estuary was formulated as a combination of the uniform treatment and the cost minimization programs. One of the most significant cause and effect relationships evaluated was that between biochemical oxygen demand and dissolved oxygen. For any given objective set the cost minimization model yielded the smallest cost and uniform treatment model yielded the largest. Certain monetary benefits could be derived from increased use of the estuary once its water quality was improved. (Thiuri-Cornell)

STOCHASTIC MODELS FOR BIOCHEMICAL OXYGEN DEMAND AND DISSOLVED OXYGEN IN ESTUARIES,
Virginia Polytechnic Inst., Blacksburg. Water Resources Research Center.
Stephen W. Custer, and Richard G. Krutchkoff.
Water Resources Center, Virginia Polytech Inst, Bull 22, February 1969. 232 p, 41 fig, 8 tab, 64 ref, 3 append. FWPCA Grant WP-01216 under FWPCA Program 16090. OWRR Project A-027-VA. Available from the Clearinghouse as PB 188 094 $3.00 in paper copy, $0.65 in microfiche.

Descriptors: *Stochastic processes, *Biochemical oxygen demand, *Dissolved oxygen, *Estuaries, *Numerical analysis, Diffusion, Computer programs, Decision making, Dispersion, Downstream, Water quality.
Identifiers: Traumatic peaks.

Two distinct stochastic models, the Non-Dispersion Model and the Diffusion Model were developed for determining the biochemical oxygen demand (BOD) and dissolved oxygen (DO) probability distribution in an estuary. The mean BOD and DO concentrations were functions of time and space, hence the probability distributions were also temporally and spatially dependent. A computer program was employed to summarize the results in a concise form so that it could be used in the overall decision process. Information for a given point in space was obtained five miles downstream from the source. The mean BOD and DO levels were obtained for each increment of the tidal cycle. The frequency of the concentration above each critical value was obtained. A comparison of the numerical results revealed that the traumatic peaks observed for the non-dispersion model were obliterated in the diffusion model. In the light of the numerical results it concluded that the non-diffusion model was inadequate for describing the astuary situation. The diffusion model was verified on water quality survey data for the Potomac estuary. (Thiuri-Cornell)
W70-01774

GENERALIZED INITIAL CONDITIONS FOR THE STOCHASTIC MODEL FOR POLLUTION AND DISSOLVED OXYGEN IN STREAMS,
Virginia Polytechnic Inst., Blacksburg. Water Resources Research Center.
Richard H. Moushegian, and Richard G. Krutchkoff.
Water Resources Res Center, Virginia Polytech Inst, Bull 28, p 1-88, August 1969. 88 p, 6 fig, 17 tech, 7 ref, 3 append. NIH Training Grant ES-00033-06; FWPCA Research Grant WP-01216-01 for Program 16090. OWRR Project A-027-VA. Available from the Clearinghouse as PB 188 095 $3.00 in paper copy, $0.65 in microfiche.

Descriptors: *Stochastic processes, *Dissolved oxygen, *Biochemical oxygen demand, *Pollutant identification, *Streamflow, Computer programs, Density stratification, Parametric hydrology, Distribution patterns, Water quality, Probability, Standards.
Identifiers: Initial conditions.

A stochastic model was developed and used to predict the biochemical oxygen demand (BOD) and dissolved oxygen (DO) concentrations at several points downstream of a waste discharge. The model used provided a joint density function for both pollution and dissolved oxygen with given initial conditions. The initial conditions were generalized to permit the output for one stream segment to be the initial conditions for the succeeding stream segment. Interest was focused on the measurement of the marginal distribution of BOD and DO along a stream stretch whose parameters may change at known locations. A computer program assisted in the calculations to obtain marginal distributions. The program allowed for changes in parameter values between one stream segment and the next and could predict distributions for any intermediate locations along the river. The application of this study lay in the analysis of an entire stream stretch to determine if it was healthy for the users within certain preset probabilistic standards. (Thiuri-Cornell)

WATER POLLUTION IN ALASKA: PRESENT AND FUTURE,
Federal Water Pollution Control Administration, College, Alaska, Water Lab.
Frederick B. Lotspeich.
Science, Vol 166, No 3910, p 1239-1245, Dec 1969. 7 p, 6 fig, 19 ref.

Descriptors: *Alaska, *Water pollution, *Ecology, *Permafrost, *Reviews, Surveys, Environment, Waste disposal, Climates, Fisheries, Water pollution sources.
Identifiers: Industrial development effects (Ecological).

Alaska is on the threshold of economic expansion. The magnitude of the expansion is unknown, but any expansion is certain to increase pollution pressures. Because Alaskan waters are, for the most part, still clean, a unique opportunity exists to apply a preventive program based on ecosystem dynamics, instead of the classical practice of cleanup after deterioration has set in. Research on the tundra and taiga ecosystems must be initiated to learn the dynamics of ecological response to man's quest for new resource development. Alaska's ecology, industry, present state of pollution, and the ecological effects of past industrial activity are briefly reviewed. The problems of the industrial use of permafrost areas are given special attention because of the North Slope oil development. (Knapp-USGS)

GENERALIZED DISTRIBUTION AND CONCENTRATION OF ORTHOPHOSPHATE IN FLORIDA STREAMS,
Geological Survey, Washington, D.C.
Matthew I. Kaufman.
Florida Dep Natur Resources, Bur Geol Map Ser No 33, Aug 1969. 1 sheet, text, 7 fig, 1 tab, 1 map, 9 ref.

Descriptors: *Water pollution sources, *Phosphates, *Florida, Industrial wastes, Municipal wastes, Farm wastes, Runoff, Leaching, Regional analysis, Fertilizers, Chemical wastes, Nutrients, Solutes, Streamflow, Distribution patterns, Mapping.
Identifiers: Orthophosphates.

The distribution and concentration of orthophosphate in Florida streams are described and shown by maps and graphs. In Florida, phosphate sources include industrial wastes, sewage effluent, agricultural drainage, urban drainage, runoff from land naturally rich in phosphates, and rainfall. The greatest contribution is manmade. (Knapp-USGS)
W70-01882

THE INFILTRATION OF ALDRIN THROUGH OTTAWA SAND COLUMNS,
Geological Survey, Idaho Falls, Idaho.
John B. Robertson, and Lloyd Kahn.
In: Geol Surv Res 1969, Prof Pap 650-C, p C219-C223, 1969. 5 p, 3 fig, 1 tab, 17 ref.

Descriptors: *Path of pollutants, *Aldrin, *Groundwater movement, Laboratory tests, Permeameters, Sands, Chlorinated hydrocarbon pesticides, Insecticides, Pesticide residues, Infiltration.
Identifiers: Ottawa sand, Aldrin infiltration.

The penetrability of chlorinated hydrocarbon insecticides through soils is dependent upon the type of formulation applied, frequency of its application, soil conditions, and the frequency and rate of rainfall or irrigation. Aldrin, a representative member of the chlorinated hydrocarbon insecticide group, was infiltrated through columns of Ottawa sand in four experiments. Most of the eluted aldrin in organic solvent systems was eluted during the passage of the first liter of water. The aldrin distributed itself in a characteristic manner through each column, depending upon the composition and stability of the emulsion and rate of water infiltration. The concentration of HHDN (active ingredient in aldrin) in the effluent from the columns reached a 'steady state' condition of 0.5 to 2 micrograms per liter of water. A commercial emulsible concentrate mixture transmitted more aldrin to the effluent than did a synthetic solution containing no emulsifier. (Knapp-USGS)

NITROGEN ENRICHMENT OF SURFACE WATER BY ABSORPTION OF AMMONIA VOLATILIZED FROM CATTLE FEEDLOTS,
Agricultural Research Service, Fort Collins, Colo. Soil and Water Conservation Research Div.
G. L. Hutchinson, and F. G. Viets, Jr.
Science, Vol 166, No 3904, p 514-515, Oct 1969. 1 fig, 1 tab, 6 ref.

Descriptors: *Nitrogen, *Surface water, *Absorption, *Ammonia, Eutrophication, Water pollution sources, Nitrogen compounds, Nutrient cycling, Fertilization, Colorado, Precipitation (Atmospheric), Lakes, Streams.
Identifiers: *Nitrogen pollution, *Cattle feedlots, Seeley Lake (Colo), Nitrogen (Total), Nitrogen (Inorganic), Nitrogen enrichment.

A method is described for estimating nitrogen enrichment of surface waters resulting from volatilization of ammonia from cattle feedlots and its subsequent absorption into lakes and streams. Rates of ammonia absorption into dilute sulfuric acid (0.01 normal) measured near feedlots were as much as 20-fold greater than controls; estimated annual absorption (in kilograms/hectare) of 73 at site about 0.4 kilometers west of 90,000-unit feedlot can be compared with 3.9 at control site with no feedlots or irrigated fields within 3 milometers and no large feedlots or cities within 15 kilometers. Ammonia absorbed by surfaces of natural waters are apparently about half that estimated by method described. That a large feedlot can enhance nitrogen enrichment of aqueous surfaces at some distances is suggested by evidence that a fivefold increase in distance from a feedlot decreased mean ammonia absorption rate by approximately one-half. Absorption rates from smaller lots were approximately 25% of large one, but above fourfold greater than control. Authors believe that wide fluctuations in ammonia absorption rates reflect the moistness of feedlot surfaces, rapid drying enhancing volatilization and absorption. Authors conclude that such feedlots are substantial sources of nitrogen pollution for nearby surface waters. (Eichhorn-Wisconsin)

5C. Effects of Pollution

WATER QUALITY AND AGING OF STRIP-MINE LAKES,
Missouri Univ., Columbia. Dept. of Zoology; and Baylor Univ., Waco, Tex., Dept. of Biology.
Robert S. Campbell, and Owen T. Lind.
J Water Pollut Contr Federation, Vol 41, No 11, Part 1, p 1943-1955, Nov 1969. 13 p, 4 fig, 10 tab, 23 ref. FWPCA Res Grant No WP-00379 Fellowship Award No 2-FL-WP-22892.

Descriptors: *Strip mine lakes, *Acidic water, *Acid mine water, *Water quality, *Lake stages, Biodegradation, Chemical reactions, Water pollution effects, Sulfur bacteria.
Identifiers: Water quality changes.

In many strip-mine lakes the water is at first acidic, but with time becomes less acidic and finally alkaline. Two distinct successional stages are recognized--acid and alkaline--and are identified by different physical, chemical, and biological characteristics. Variation among lakes in the acid stage is dependent on the degree of acid pollution. (Knapp-USGS)

THE BIOLOGICAL EFFECTS OF OIL POLLUTION ON LITTORAL COMMUNITIES. PROCEEDINGS OF A SYMPOSIUM, ORIELTON FIELD CENTRE, PEMBROKE, WALES, 17-19, February, 1968.

London, Field Studies Council, July, 1968. 198 p. Supplement to Vol 2 of Field Studies Council. Edited by J. D. Carthy and Don R. Arthur.

Descriptors: *Oil wastes, *Water pollution effects, *Water pollution sources, *Emulsifiers, *Detergents, *Ecology, *Environmental effects, Toxicity, Plant growth, Animal diseases, Microbiology, Bibliographies, Oily water, Ecosystems.
Identifiers: *Torrey Canyon, BP-1002, Durham coast, *Oil spillage.

The purpose was to assess the problems which are raised by oil pollution of a highly complex ecosystem. Oil, derived as it is by biological action, is a complex of substances whose chemistry is, even today, not fully known. The environment is similarly an interwoven web of factors, whose interactions, even under normal conditions, we are only just beginning to understand. When oil pollutes a balanced natural community, it brings a new unnatural factor to imbalance the environmental scene. Another complex variable is introduced when emulsifiers are used to clean away the oil. This symposium collects together the essential basic information, not only on oil but also on the background from which studies of the environmental effects can be initiated. (See also W70-01777 thru W70-01787).

EXTENT OF DAMAGE TO COASTAL HABITATS DUE TO THE TORREY CANYON INCIDENT,
Furzebrook Research Station, Wareham (England).
D. S. Ranwell.
Biological Effects of Oil Pollution on Littoral Communities. Supplement to Volume 2 of Field Studies. London, Field Studies Council, July, 1968. p 39-47.

Descriptors: *Emulsifiers, *Mortality, *Marine algae, *Marsh plants, *Marine animals, *Oily water, Lichens, Tidal effects, Dispersion, Oil-water interfaces, Persistence, Water pollution treatment, Water pollution effects.
Identifiers: *Torrey Canyon, Susceptibility, Regeneration, Cliff vegetation, Sand dunes.

The full range of oil-contaminated habitats resulting from the Torrey Canyon spill were investigated from the air and ground. Decontamination measures and tidal action effectively cleared most oil from the Cornish coast, although some persisted throughout 1967. Over 1 1/2 million gallons of emulsifiers were used. They rapidly cleared the water surface but they distributed contamination beyond the original contamination area, both in depth in sand and water. Toxic elements in the emulsifiers destroyed some marine flora and fauna. The greatest damage occurred on the rocky shorelines where much oil was stranded. Inter-tidal algae and lichens suffered the most extensively among plants because of a cut-off of light and air. The most toxic fractions of crude oil are volatile and disappear rapidly. Manual removal of oil was much preferred over chemical removal methods, as it did not add to pollution. At least 100 species of algae, lichens, and flowering plants were filled by oil or emulsifier pollution. (See W70-01776). (Sjolseth-Washington)
W70-01777

PROBLEMS IN THE ASSESSMENT OF THE EFFECTS OF POLLUTION ON INSHORE MARINE ECOSYSTEMS DOMINATED BY ATTACHED MACROPHYTES,
Durham Univ. (England). Dept. of Geography.
David J. Bellamy, and Alan Whittick.
Biological Effects of Oil Pollution on Littoral Communities. Supplement to Volume 2 of Field Studies. London, Field Studies Council, July, 1968. p 49-54.

Descriptors: *Phytometers, *Aquatic environment, Water pollution effects, Monitoring, Growth rates, Biological communities, Bioindicators.
Identifiers: *Durham Coast, *Phytosociological systems, *Macrophytic algae, Torrey Canyon, Kelp ecosystem performance, Site comparisons, Long-term pollution, Short-term pollution.

Methods have been developed in inshore marine ecosystems for the study of the effects of long-term pollution and these have been used to ascertain the effects of short-term pollution by reference to a study of the Torrey Canyon mishap. One method utilizes comparison with pre-pollution data. Another method is a contemporary comparison between nearby polluted and unpolluted sites. The data obtained by this method was used in two ways to obtain adequate comparison; (a) comparison of individual performance, and (b) comparison of ecosystem performance and potential. These methods have proved to be somewhat successful, although more data will have to be collected to distinguish pollution effects from variations due to natural environmental conditions. (See W70-01776). (Sjolseth-Washington)
W70-01778

EXPERIMENTS WITH SOME DETERGENTS AND CERTAIN INTERTIDAL ALGAE,
University Coll. of Wales, Aberystwyth. Dept. of Botany.
A. D. Boney.
Biological Effects of Oil Pollution on Littoral Communities. Supplement to Volume 2 of Field Studies. London, Field Studies Council, July, 1968. p 55-72.

Descriptors: *Detergents, *Marine algae, Water pollution effects, Lethal limit, Growth rates, Spores.
Identifiers: *Torrey Canyon, *Detergent concentrations, Survival, Susceptibility, Physiological observations, Chronic exposure, Acute exposure.

The direct effects of detergent application following the Torrey Canyon disaster on seven test species of marine algae were studied. Six detergents were used each at several different concentrations. The receptacle tissues of Ascophyllum nodosum were damaged. Cell damage was extensive in Cladophora rupestris. Bryopsis hypnoides were easily killed. The cept phases of Prasinocladus marinus were destroyed by detergents. Growth and spore production of Acrohaetium infestans were retarded. No immediate cell damage was noticed among Polysiphonia lanosa and Porphyra umbilicalis. Both acute and chronic exposures were utilized. (See W70-01776). (Sjolseth-Washington)
W70-01779

BIOLOGICAL CONSEQUENCES OF OIL POLLUTION AND SHORE CLEANSING,
University Coll. of Swansea (Wales). Dept. of Zoology.
A. Nelson-Smith.
Biological Effects of Oil Pollution on Littoral Communities. Supplement to Volume 2 of Field Studies. London, Field Studies Council, July, 1968. p 73-80.

Descriptors: *Oily water, *Marine algae, *Emulsifiers, Water pollution effects, Mortality, Gastropods, Marine plants, On-site data collections.
Identifiers: *Torrey Canyon, Repopulation, Susceptibility.

The effects of oil spills in different areas were investigated to provide interesting comparisons. Oil spilled into a small cove yielded extensive shore pollution and mortalities. No emulsifiers were used, and in less than a year the animal populations were again normal. Gastropod molluscs appeared to be most seriously affected. Marine algae populations were also reduced. Misuse of emulsifiers embedded the oil more firmly and resulted in increased mortalities. Emulsifiers enable the oil to wet the surfaces of shore organisms and to penetrate their systems and also to spread the oil to previously unreached areas. Time of year of oil spill and mobility of organisms regulate the rate at which the members of the shore community are able to recover from oil pollution. (See W70-01776). (Sjolseth-Washington)
W70-01780

THE TOXICITY OF OIL EMULSIFIERS TO SOME INSHORE FAUNA,
University of Strathclyde, Glasgow, (Scotland). Dept. of Biology.
E. J. Perkins.
Biological Effects of Oil Pollution on Littoral Communities. Supplement to Volume 2 of Field Studies. London, Field Studies Council, July, 1968. p 81-90.

Descriptors: *Emulsifiers, *Lethal limit, *Bioassay, Marine animals, Water pollution effects, Hydrogen-ion concentration.
Identifiers: *Torrey Canyon, BP 1002, Long-term effects, Short-term effects, Recovery, Dose, Inshore fauna.

Determinations of the acute toxicity of several emulsifiers (BP 1002, Basic 'Slickgone' and Petrofina Tarsolvent) were made and based upon the 24-hour TLm. Oil emulsifiers were found to be very toxic to marine animals. BP 1002 was the most toxic emulsifier. The toxicity of the emulsifiers was related to their stability. The more stable, the more toxic. It was pointed out that effects at dose levels much below the median tolerance limits are likely to be significant in the long run. All emulsifiers tested depressed the pH of seawater. Emulsifiers may produce 100 per cent mortality in 96 hours, at concentrations as low as 10 ppm. The TLm was noticed to vary from season to season. (See W70-01776). (Sjolseth-Washington)
W70-01781

OIL, EMULSIFIERS AND COMMERCIAL SHELLFISH,
Ministry of Agriculture, Fisheries and Food, Burnham-on-Crouch (England). Fisheries Lab.
A. C. Simpson.
Biological Effects of Oil Pollution on Littoral Communities. Supplement to Volume 2 of Field Studies. London, Field Studies Council, July 1968. p 91-98.

Descriptors: *Emulsifiers, *Crustaceans, *Mollusks, Oily water, Water pollution effects, Taste, Lethal limit.
Identifiers: BP 1002, Relative susceptibilities, Life stage.

There is no evidence that shellfish have ever been killed by oil spilled, although economic loss is realized because the oil makes them unpalatable. Tested the harm that solvent/emulsifiers might do to shellfish if applied directly on the grounds and determined the toxicity of the solvent/emulsifiers in sea water. Found that if the emulsifiers were applied to areas containing shellfish, a proportion would be killed. These chemicals (diluted in the sea) were also toxic to marine animals. The toxicity of BP 1002 was found to decrease rapidly with time, due primarily to evaporation of the solvent. Experiments were undertaken to determine the relative toxicities to mulluscs and crustaceans of 9 solvent/emulsifiers. The young stages of animals were more susceptible to toxic subtances than were adults. Emulsifiers were found to taint the flesh of shellfish, making them unsaleable. (See W70-01776). (Sjolseth-Washington)
W70-01782

OIL POLLUTION AND BIRD POPULATIONS,
Seabird Group.
W. R. P. Bourne.
Biological Effects of Oil Pollution on Littoral Communities, Supplement to Volume 2 of Field Studies. London, Field Studies Council, July 1968. p 99-121.

Descriptors: *Water birds, *Oily water, Rehabilitation, Fecundity, Water pollution effects, Migratory birds, Migration patterns, Data collections, Mortality.
Identifiers: *Torrey Canyon, Adaptations.

Aquatic birds are particularly susceptible to oil pollution. Since their reproductive capacity is low, the results are devastating. An historical survey of the work conducted on oil pollution and birds is presented. The effect of past oil spills on bird populations is described in detail. Declines of certain bird populations are related to oil pollutions. The composition of the bird-kill in some British oil pollution incidents (e.g., Torrey Canyon) was presented. The main mortality occurs among the young birds. Extreme adaptation to an aquatic environment renders birds susceptible to oil pollution because they are not capable of sustained flight and must often touch the water surface where they are continually exposed to floating oil. Aquatic seabirds have no defenses against oil. Rehabilitation of oil contaminated birds is not very successful. Possible future research is discussed. (See W70-01776). (Sjolseth-Washington)

POST-MORTEM FINDINGS IN OILED AUKS DYING DURING ATTEMPTED REHABILITATION,
Wildfowl Trust, Slimbridge (England).
J. V. Beer.
Biological Effects of Oil Pollution on Littoral Communities. Supplement to Volume 2 of Field Studies. London, Field Studies Council, July 1968. p 123-129.

Descriptors: *Oily water, *Rehabilitation, *Water birds, Water pollution effects, Mortality, Stress, Parasitism, Diseases.
Identifiers: *Post-mortem examination, Torrey Canyon, Auks, Starvation.

Birds suffering from oil pollution occuring after the Torrey Canyon affair were captured and given rehabilitation. The survival of auks during attempted rehabilitation was determined to be low. Mortality during attempted rehabilitation followed an exponential path. Only a small proportion of birds were rehabilitated. The dead birds were given post-mortem examinations. Practically all of the birds which died were emaciated. Respiratory disease, acute enteric conditions, renal diseases, and oil stained plumage were among the most serious conditions. The pattern of mortality and pathological changes were strongly suggestive of severe stress and the presence of powerful irritants of poisons in the gut. (See W70-01776). (Sjolseth-Washington)

EFFECT OF DETERGENTS AND OILS ON THE CELL MEMBRANE,
Chester Beatty Research Inst., London (England).
R. J. Goldacre.
Biological Effects of Oil Pollution on Littoral Communities. Supplement to Volume 2 of Field Studies. London, Field Studies Council, July 1968. p 131-137.

Descriptors: *Emulsifiers, *Biological membranes, *Detergents, Effects of water pollution, Solubility, Chemical properties.
Identifiers: *Paraffin hydrocarbons, *Amoeba proteus, BP 1002, Anionic detergents, Cationic detergents, Non-ionized detergents, Volatility, Narcotic effects.

This paper reports on the effects of various pure substances found in crude oil and in emulsifiers on the plasma membrane of Amoeba proteus. With increasing oil concentrations the Amoeba became anaesthetized, the plasma membrane doubled in area, and the inner surface of the cell membrane peeled off. If the cells were kept in the oil, they died, often accompanied by bursting of the plasma membrane. Paraffin hydrocarbons above C14 were not able to damage the membrane. Involatile and relatively insoluble oils had no effect on Amoeba even in saturated solution. Anionic detergents cause rapid removal of the cell membrane, resulting in bursting of the cell. Cationic detergent caused a toughening of the cell membrane and eventually death. Non-ionized detergents such as BP 1002 used in the Torrey Canyon disaster also left a visible membrane after killing the cells. Author feels that the mechanism with detergents may therefore be adsorption on the membrane of competition for adsorption with an existing membrane component. (See W70-01776). (Sjolseth-Washington)
W70-01785

THE BIOLOGICAL PROBLEMS OF LITTORAL POLLUTION BY OIL AND EMULSIFIERS -- A SUMMING UP,
King's Coll., London (England). Dept. of Zoology.
Don R. Arthur.
Biological Effects of Oil Pollution on Littoral Communities. Supplement to Volume 2 of Field Studies. London, Field Studies Council, July 1968. p 159-164.

Descriptors: *Oily water, *Marine animals, *Mortality, Water pollution treatment, Water pollution effects, Marine plants, Emulsifiers, Detergents, Aquatic environment, Biological communities, Mollusks, Crustaceans, Rehabilitation.
Identifiers: Torrey Canyon, Regeneration, Recovery.

The author reviews the biological problems of Littoral pollution by oil and emulsifiers discussed in the symposium of which this paper is a part. The magnitude of oil pollution and prospects for increased pollution are described. The dangers of pollution are elaborated. The primary causes of death by pollution are reviewed. The need for determining the chronic effects of oil pollution is stated. Nine problems which urgently need the attention of biologists are elaborated. (See W70-01776). (Sjolseth-Washington)

PHYSIOLOGY OF GRANULAR LEUKOCYTES IN FISH BLOOD,
L. I. Smirnova.
Translation from Voprosy Ikhtiologii. Problems of Ichthyology, Vol 8, No 5, 1968. p 748-755.

Descriptors: *Fish physiology, *Algae, *Thermal pollution, *Toxicity.
Identifiers: *Fish hematology, *Granular leucocytes, *Muscular exertion, *2-methyl-5-vinylpyridine, *Glue green algae, Bream, White bream, Leukocytic composition, Alternating current.

A connection was established between the leucocytic composition of the blood in fed and starving bream. An increase in the number of granulocytes circulating in the blood was observed in some favorable and some stress conditions, such as intensive feeding, temperature increase, increased activity, electrical stimulation and exposure to 2-methyl-5-vinylpyridine, Blue green algae. With the changes in the white blood cell composition, there were parallel reductions in the resistance of red cells and their subsequent destruction. (Katz-Washington)
W70-01788

MORTALITY RATE OF DREISSENA IN ANAEROBIC CONDITIONS,
V. P. Mikheev.

Trans from Trudy Instituta Biologii Vnutrennikh Vod, No 7 (10), 1964. Jerusalem, Israel Program for Scientific Translations, 1968, p 65-68.

Descriptors: *Mollusks, *Oxygen sag, *Anaerobic conditions, *Mortality, Water pollution.
Identifiers: *Dreissena, *Oxygen deficient waters, *Water temperature effects, *Oxygen requirements.

Reported an experiment to determine ability of Dreissena to tolerate reduced oxygen conditions. Dreissena were able to survive in water with D.O less the 0.7 mg/l for several days and some survived for two days in anaerobic water. Survival in the water of reduced D.O was less at higher temperatures. Small mollusks have greater relative oxygen consumption and die sooner than the larger organisms. (Katz-Washington)
W70-01789

EFFECTS OF COBALT CHLORIDE ON PHYSIOLOGICAL INDICES IN RAINBOW TROUT (SALMO IRIDEUS GIBBONS),
Gosudarstvennyi Nauchno-Issledovatelskii Institut Ozernogo i Rechnogo Rybnogo Khozyaistva, Leningrad (USSR).
A. A. Shabalina.
Translation from Voprosy Ikhtiologii, Problems of Ichthyology, Vol 8, No 5, 1968, p 741-747.

Descriptors: *Rainbow trout, *Cobalt, *Toxicity, Water pollution effects, Water temperature.
Identifiers: *Cobalt chloride, *Body fat distribution, Hemoglobin content, Hematological indices, Heat tolerance.

Cobalt chloride was added to the diet of young and two-year old rainbow trout. The tolerance of the young trout to increased water temperatures was not affected, but the tolerance of the two-year olds was increased by 1.6 deg C. Hemoglobin content of the blood was unchanged. The distribution of body fat was changed. In toxic doses cobalt produced gastro-intestinal hemorrhages in both groups of fish. (Katz-Washington)
W70-01790

EFFECTS OF FOREST SPRAYING WITH DDT IN NEW BRUNSWICK ON FOOD OF YOUNG ATLANTIC SALMON,
University of Western Ontario, London. Dept. of Zoology.
Miles H. A. Keenleyside.
Journal of Fisheries Research Board of Canada, 24 (4), 1967, 807-822. 6 fig, 4 tab, 20 ref.

Descriptors: *Atlantic salmon, *DDT, *Fish diets, *Aquatic insects, Spraying, Feeding rates, Forage mixtures, Diptera.
Identifiers: *Stomach contents, Ephemeroptera, Trichoptera, Chironomidae.

Food in stomachs of your Atlantic salmon from the Northwest Miramichi River, N.B., changed following aerial DDT spraying of the surrounding watershed. Before spraying, young salmon typically ate immature aquatic insects, fry (underyearlings) concentrating on Diptera and small Ephemeroptera, and parr (overyearlings) on Diptera, Trichoptera, and all sizes of Ephemeroptera. Reduction of all aquatic insects by DDT was soon followed by resurgence of Chironomidae and other Diptera, and surviving fry fed heavily on these; parr fed on Diptera but also ate snails, worms, and fish, previously unimportant in their diet. Five years after the last spraying the prespray complexity of young salmon food was being approached. Trichoptera were slowest of the major fish-food types to reappear in stomachs. In fry stomachs Ephemeroptera, and in parr stomachs Ephemeroptera and trichoptera, were relatively more abundant than in the surrounding stream fauna. Greater availability of these insects and active selection by fish are discussed as possible causes of these relationships. (Sjolseth-Washington)
W70-01793

PHYSIOLOGICAL TOLERANCES AND BEHAVIOR RESPONSES OF FIVE SPECIES OF HAUSTORIIDAE (AMPHIPODA: CRUSTACEA) TO FIVE ENVIRONMENTAL FACTORS,
Fisheries Research Board of Canada. Marine Ecology Lab.; and Bedford Inst., Dartmouth (Nova Scotia).
D. D. Sameoto.
Journal of Fisheries Research Board of Canada, Vol 26, No 9, 1969, p 2283-2298. 3 fig, 3 tab, 32 ref.

Descriptors: *Amphipoda, *Crustaceans, *Organic matter, *Oxygen requirements, *Particle size, *Salinity, *Temperature, Sediments.
Identifiers: *Desiccation, *Gaustoriidae, Cape Cod.

Five species of haustoriid amphipods from Cape Cod, Massachusetts, differed in their tolerances to high temperature, desiccation, low salinity, and low oxygen concentration and in references for different sediment sizes. Two intertidal species, Haustorius canadensis Bousfield and Neohaustorius biarticulatus Bousfield, survived longer in air at 100% relative humidity and were more resistant to high water temperature than three species that are basically subtidal, Acanthohaustorius millsi Boudfield, Parahaustorius longimerus Boudfield, and Protohaustorius deichmannae Boudfield. All five species preferred sediments of a particular size range, the intertidal species selecting coarser sediments than the subtidal species. The sediment preference shown by the intertidal species could be changed by altering the organic conditions of the sediment by either drying or igniting the sediment. Acanthohaustorius millsi was the species most tolerant to low oxygen concentration and H. canadensis had the lowest oxygen consumption rate of the five species. The ecological significance of these findings is discussed in relation to the distribution of the five species on Cape Cod. (Tyner-Washington)
W70-01794

INFLUENCE OF TEMPERATURE ON GAFFKEMIA, A BACTERIAL DISEASE OF THE LOBSTER HOMARUS AMERICANUS,
Fisheries Research Board of Canada, Halifax (Nova Scotia). Halifax Lab.
James E. Stewart, John W. Cornick, and B. M. Zwicker.
Journal of Fisheries Research Board of Canada, Vol 26, No 9, 1969, p 2503-2510. 4 fig, 2 tab, 9 ref.

Descriptors: *Temperature, *Lobsters, *Infection, *Pathogenic bacteria, Bacteria, Sea water.
Identifiers: *Gaffkemia, Mean time to death, Nova Scotia, Homarus americanus, Gaffkya homari.

The mean time to death for lobsters (Homarus americanus) infected with Gaffkya homari and kept at constant temperatures was 2 days at 20 C, 12 days at 15 C, 28 days at 10 C, 65 days at 7 C, 84 days at 5 C, and 172 days at 3 C. The lobsters were unable to mobilize at any of these temperatures systemic defenses adequate to eliminate the pathogen. No deaths that could be attributed to infection with G. homari occurred during the 250-day trial at 1 C; the pathogen, however, was not eliminated at this temperature but remained in the lobsters at low levels with virulence unchanged and gave rise to a fatal infection when the temperature was increased. Further studies showed that infected lobsters were adversely affected by a relatively rapid increase of 10 degrees C but not by a 5-degree C increase; a relatively rapid decrease of 15 degrees C but not 10 degrees C was adverse. Infected lobsters at 15 C were most sensitive to a 5-degree C decrease around the 12th day of the infection. (Tyner-Washington)

TREATMENT OF SHELL WITH POLYSTREAM TO INCREASE SURVIVAL OF OYSTERS (CRASSOSTREA VIRGINICA) IN VIRGINIA,
Virginia Inst. of Marine Science, Gloucester Point.
Dexter S. Haven, and James P. Whitcomb.
Special Scientific Report No 54, Mar 1969. 6 p, 2 tab, 5 ref.

Descriptors: *Oysters, *Predation, *Virginia, Mollusks, Molluscacides, Pesticides, Snails.
Identifiers: *Drills, *Plystream, Crassostrea virginica, Oyster spat, Urosalpinx cinerea.

Survival of oysters set on shells treated with Polystream was investigated during 1963 and 1964. Treated and control shells were held in wire bags in the high-salinity intertidal seaside area of the Eastern Shore and in the moderate-salinity subtidal areas of the lower James River. Significantly more spat survived on treated shells than on controls. Differences in survival could not be attributed to absence of drill predation on treated shall. (Tyner-Washington)
W70-01797

THE EFFECTS OF pH, TEMPERATURE AND ACTINOMYCIN ON THE SULFHYDRYL GROUPS IN LIVING EMBRYOS OF SEA URCHINS (FRENCH),
McGill Univ., Montreal (Quebec). Dept. of Zoology.
N. Wolfson.
Comptes rendus des seances de la Societe de Biologie, Vol 162, No 1, 1968, p 73-76. 3 tab, 5 ref.

Descriptors: *Embryonic growth stage, *Proteins, *Temperature, Acidity, Alkalinity.
Identifiers: *Actinomycin, *Mercurial, *pH, *Sea urchins, *Sulfhydryl groups, Blastula, Gastrula, Embryo, Paracentrotus lividus.

The amount of organic mercurial which living embryos of sea urchins can bind shows a gradual increase during early development, an increase which is interpreted as a rise in the superficial sulfhydryl groups accessible to the mercurials. Variations of pH and of temperature produce changes in the SH assay which are compatible with the expected influence of these factors on the availability of SH. Embryos blocked in blastula stage by actinomycin show very little decrease in amount of mercurial bound as compared to gastrular controls, indicating that new gastrular proteins contribute little to binding of mercurials. (Tyner-Washington)

WATER POLLUTION IN ALASKA: PRESENT AND FUTURE,
Federal Water Pollution Control Administration, College, Alaska, Water Lab.
For primary bibliographic entry see Field 05B.
W70-01879

THE SURVIVAL OF SALMON (SALMO SALAR L.) AND SEA TROUT (S. TRUTTA L.) IN FRESH AND SALINE WATER AT HIGH TEMPERATURES,
Ministry of Agriculture, Fisheries and Food, London (England).
J. S. Alabaster.
Water Research, Vol 1, p 717-730, Oct 1967. 6 fig, 6 tab, 17 ref.

Descriptors: *Temperature, *Thermal pollution, *Smolt, *Acclimatization, Salmon, Trout, Salinity, Fisheries.
Identifiers: Salmon parr, Trout parr, Ionic balance, Scotland.

The survival of salmon and seatrout smolts, on sudden exposure to increased temperature, has been measured under field and laboratory conditions in both fresh and salt water. Smolts are more sensitive than parr when tested in fresh water, particularly if no special care is taken to acclimate the fish to the test conditions beforehand. Salmon smolts are most sensitive to an increase in temperature when exposed simultaneously to change from fresh to sea water, though the effect is much less even after only 7 hours prior acclimation to sea water; they are most resistant when tested in 30 per cent sea water. The results indicate that, at the beginning of the period of smolt migration, when acclimation temperatures are about 8 deg C, the rise in temperature of cooling water used by power stations (6-9 deg C) is smaller than any change that could kill fish. At the height of the smolt season, with acclimation temperatures of 10-12 deg C, only abnormal increase in temperature such as might be the case with recirculating back to the cooling water intake, if accompanied by a change from fresh to sea water, without prior acclimation will be lethal. PHYSIOLOGY OF ACCLIMATION TO LOW TEMPERATURE IN POIKILOTHERMS,
Sri Venkateswara Univ., Tirupati (India). Dept. of Zoology.
Kandula Pampapathi Rao.
Science, Vol 137, p 682-3, Aug 1962. 1 tab, 9 ref, 2 p.

Descriptors: *Acclimatization, *Cold resistance, Temperature, Mussels, Worms.

The freshwater mussel, Lamellidens marginalis, and the earthworm, Lampito mauritii, were acclimated to temperatures of 29 deg plus or minus 1 deg C and 19 deg C plus or minus 1 deg C for 20 to 30 days. Analysis of blood of mussels drawn from the heart and body fluids from the earthworm revealed an increase in sodium, potassium, and calcium during cold acclimation in both species. Chloride, magnesium, and free amino acids decreased in both species. Increased protein synthesis occurred in both species and neurosecretory cells of the cold acclimated earthworms exhibited increased activity. Addition of cold acclimated worm body fluid stimulated oxygen consumption in tissues of warm acclimated specimens, indicating that a hormonal agent triggers the sequence of biochemical changes. BENEFICIAL USES OF THERMAL DISCHARGE,
New York State Dept. of Commerce, Albany; and State Univ. of New York, Albany. Atmospheric Sciences Research Center.
R. Stewart, and S. Bjornsson.
Summary Report of the Adirondack Conference, Oct 14-17, 1969. 12 p, 2 fig.

Descriptors: Temperature, *Thermal pollution, *Freeze-drying, Cooling towers.
Identifiers: *Space heating.

This article is the summary of the Adirondack conference and deals with present and future uses of hot water and low grade steam. In Iceland geothermal discharges are being used for space heating, processing, industry, swimming pools and other sporting facilities. The Icelandic fish culture designed to raise salmonoids to release-size in eight months instead of the normal growth period of two years, uses the geothermal discharge to maintain the proper temperature range (10-12C). Of greater economic significance is the use of the steam for freeze-drying. A freeze-dried product weighs about 10-30% of its original weight and may be stored for years. To freeze 1 Kg/fish takes 10.5 Kwh so discharge from 1000 Mw plant contains sufficient heat to freeze-dry 200 tons of fish per hour. A 1000 Mw reactor could heat a 500 acre green house farm (effectively horizontal cooling towers) producing $12 million/year in crops. (Upadhyaya-Vanderbilt)

THERMAL REINFORCEMENT AND THERMOREGULATORY BEHAVIOR IN THE GOLDFISH, CARASSIUS AURATUS,
Harvard Univ., Cambridge. Psychological Labs.; and Harvard School of Public Health, Boston, Mass.
Paul N. Rozin, and Jean Mayer.
Science, Vol 134, Sept 1961. 2 p, 2 fig, 5 ref.

Descriptors: *Temperature control, *Training, Fish.
Identifiers: *Goldfish.

This work shows that goldfish can be trained to perform an arbitrary response in order to bring the environmental temperature closer to its preferred temperature, and if they are given an opportunity, they will control their body temperature to a certain extent. Each of seven goldfish was trained to press a lever with its head in order to produce a drop of approximately 0.3 deg C in the environmental temperature. Two procedures were followed in the experimental sessions. In the first the lever was not accessible until the temperature was raised to 38 deg C, just 3 deg C below the lethal temperature. In the second procedure the temperature was raised gradually from the acclimatization value of 23.5 deg C, and the lever was available throughout the test. Under both procedures the fish controlled the temperature at a level between 33.5 and 36.5 deg C, indicating that the goldfish will regulate its body temperature under constant high-temperature stress. AN INVESTIGATION BY RAPID CARBON-14 BIOASSAY OF FACTORS AFFECTING THE CULTURAL EUTROPHICATION OF LAKE TAHOE, CALIFORNIA-NEVADA,
California Univ., Davis. Dept of Zoology; and Engineering-Science Inc., Oakland, Calif.
Charles R. Goldman, and Ralf C. Carter.
Journal Water Pollution Control Federation, Vol 37, No 7, p 1044-1059, 1965. 11 fig, 5 tab, 27 ref.

Descriptors: *Lakes, *Carbon radioisotopes, *Bioassay, *Eutrophication, *California, *Nevada, Limnology, Primary productivity, Chlorophyll, Sampling, Phytoplankton, Radioactivity, Photosynthesis, Chemical analysis, Trace elements, Temperature, Iron, Nutrients, Light penetration, Sewage effluents, Oxygen, Solar radiation, Periphyton, Bacteria, Spectroscopy, Copper, Nitrogen, Phosphorus, Algae, Water pollution effects, Water chemistry.
Identifiers: *Lake Tahoe (Calif-Nev), Transparency, Light measurements, Euphotic zone, Plant carotenoids, Carbon fixation, Pelagic region, Monomictic, Depth effects, Ionic concentration, Seasonal effects.

Attempts were made to determine significant variability in the present fertility of Lake Tahoe, to estimate more precisely the lake's productivity by a more comprehensive sampling program than previously possible, and, with carbon-14 bioassay methods, to determine eutrophication potential of inflow, both natural and that enriched with sewage effluent. The extreme sensitivity of the carbon-14 method provides a means of predicting levels of nutrient addition which might cause objectional eutrophication. Assumption that the physiological condition of plankton is variable in different parts of the lake is supported by results of study. Areal estimates of productivity were determined by integrating photosynthetic curves resulting from consideration of light extinction, variation in temperature, and the distribution of plankton with depth. A secondary sewage effluent, when diluted to 1/3,700 of original strength, stimulates bioactivity in Lake Tahoe sufficiently to produce a 1% decrease in light transmittance within 12 days. Measurements of primary productivity around the lake's margin show that, despite extensive mixing, localized signs of eutrophication are evident. The extreme sensitivity of Lake Tahoe waters to any change in nutrient regime clearly evidences the potential of even treated effluent for speeding eutrophication. (Jones-Wisconsin)

TDE RESIDUES IN CLEAR LAKE ANIMALS,
California State Dept. of Fish and Game, Sacramento. Wildlife Management Branch; and California State Dept. of Public Health, Sacramento. Food and Drug Lab.
Jack D. Linn, and Ronald L. Stanley.
California Fish and Game, Vol 55, No 3, p 164-178, 1969. 1 fig, 13 tab, 5 ref.

Descriptors: *Chlorinated hydrocarbon pesticide, *Pesticide residues, Bass, Bullheads, Gulls, California, Catfishes, Plankton, Sunfishes, Gas chromatography, Water pollution sources, Water pollution effects.
Identifiers: *DDD, *TDE, Black crappie, Goldeneye, Grebe, Merganser, Sacramento perch, Clear Lake (Calif), Tetrachloro-diphenyl-ethane, Dichloro-diphenyl-dichlorethane.

Thirteen collections taken from Clear Lake, California, between 1959 and 1965, comprising eight fish species, four bird species and one plankton sample, were analyzed for TDE (DDD) residues. Colorimetric method (before 1962) and electron capture gas chromatography were used to determine concentrations of pesticide. No well-defined year-to-year trend in residue levels was noted when all samples were examined together. White catfish showed some tendency toward increased residue levels with increasing age, while mean annual TDE residue in largemouth bass (1958 year class) decreased from 23.5 parts/million (ppm) in 1958 to 7 ppm in 1963. Evidence indicates that TDE contamination, originating from three applications for insect control in 1949, 1954 and 1957, is declining. Mean annual levels in white catfish have declined from 85.7 ppm (1958) to 9.6 ppm (1965) and levels in largemouth bass have declined from 40.9 ppm (1958) to 12.2 ppm (1963). Tabular data include results of flesh and fat analyses for all collections and a comparison of data derived by colorimetric and gas chromatographic methods. (Voigtlander-Wisconsin)

PROCEEDINGS OF THE CONFERENCE ON CHANGES IN THE BIOTA OF LAKES ERIE AND ONTARIO.
Buffalo Society of Natural Sciences, N.Y.; and State Univ. of New York, Buffalo. Research Foundation.

Bulletin of the Buffalo Society of Natural Sciences, Vol 25, No 1, 1969. 84 p, 19 fig, 2 tab, 141 ref. Sweeney, Robert A (Editor).

Descriptors: *Conferences, *Biota, *Lake Erie, *Lake Ontario, Analytical techniques, New York, Ecology, Great Lakes, Planning, Eutrophication, Plankton, Water pollution effects, Commercial fish, Fish, Lakes, Plants, Benthos.
Identifiers: Buffalo Society of Natural Sciences, State University College at Buffalo, Buffalo (NY), Lower Great Lakes, Game fish, Ecological techniques.

Growing public concern exists regarding changes effected by pollution and cultural eutrophication on the biota of Lakes Erie and Ontario, particularly regarding the decline of commercial and game fishes, the marked increase of less desirable species, and the alteration in quality and quantity of the flora. This publication reports the proceedings of a conference, held on April 16-17, 1968, of a small group of investigators interested in current or planned studies of these lakes. The conference was organized by the Biology Department, State University College at Buffalo and the Buffalo Society of Natural Sciences and supported by the Research Foundation of the State University of New York. Individual contributions, with names of author indicated in parentheses, are: Changes in the biology of the Lower Great Lakes (Charles A Dambach); Plants in Lakes Erie and Ontario, and changes of their numbers and kinds (Charles C Davis); and Changes in the benthos of Lakes Erie and Ontario (Ralph O Brinkhurst). Report includes an introduction, transcription of discussions following individual papers, and a transcription of a discussion by all participants of problems and techniques. (See also W70-01943 thru W70-01945). (Eichhorn-Wisconsin)

CHANGES IN THE BIOLOGY OF THE LOWER GREAT LAKES,
Ohio State Univ., Columbus. Natural Resources Inst.
Charles A. Dambach.
Bulletin of the Buffalo Society of Natural Sciences, Vol 25, No 1, p 1-17, 1969. 19 ref.

Descriptors: *Biology, *Great Lakes, *Lake Erie, *Lake Michigan, *Lake Ontario, Lake Huron, Aesthetics, Ecology, Economics, Ohio, Commercial fishing, Public health, Walleye, Vegetation, Wild rice, Silts, Plankton, Mayflies, Fauna, Fish, Oligochaetes, Midges, Snails, Phosphorus, Nutrients, Algae, Diatoms, Chlorophyta, Dissolved oxygen, Pike, Carp, Drum (Freshwater), Cisco, Lake trout, Eutrophication, Striped bass, Cyanophyta, Water pollution effects, Electric powerplants.
Identifiers: Hexagenia, Chironomidae, Procladius, Chironomus promosus, Trichoptera, Leeches, Fingernail clams, White fish, Alewife, Gizzard shad, Sea lamphrey, Coho salmon.

Dramatic biological changes have appeared in bottom fauna and among certain fishes of the lower Great Lakes. Of special significance is abundant increase, since 1959, of the midge Procladius, a supposedly more pollution-tolerant form, while Chironomus promosus has decreased, suggesting that pollution zones have extended further into the lakes. The mayfly is now rare. Benthic fauna is now dominated by oligochaetes and midges, with some fingernail clams, snails, and leeches on the increase. Chemical conditions probably provide a more reliable index to changes than plankton data, but are difficult to relate. Species composition, once dominated by diatoms, are now dominated by blue-green algae. Decline of certain high quality fishes, notably the blue pike and walleye pike, is largely responsible for the accelerated public interest in corrective measures. Relative significance of environment versus overfishing is debatable. Increase in eutrophication rate of the Great Lakes, especially Lake Erie, is significant. Human technology can so modify the environment that biological populations are significantly affected. Biologists with requisite knowledge, should develop better guidelines for weighing costs of each increment of degradation and each increment of improvement. (See W70-01942). (Jones-Wisconsin)

PLANTS IN LAKES ERIE AND ONTARIO, AND CHANGES OF THEIR NUMBERS AND KINDS,
Memorial Univ. of Newfoundland, St. Johns. Dept. of Biology.
Charles C. Davis.
Bulletin of the Buffalo Society of Natural Sciences, Vol 25, No 1, p 18-44, 1969. 8 fig, 2 tab, 100 ref.

Descriptors: *Lake Erie, *Lake Ontario, *Plants, Phytoplankton, Benthic fauna, Benthic flora, Diatoms, Nannoplankton, Ecology, Climates, Weather modification, Depth, Eutrophication, Glaciation, Water levels, Storms, Seiches, Solar radiation, Rainfall, Runoff, Winds, Carp, Muskrats, Turbidity, Cyanophyta, Chlorophyta, Ecosystems, Molds, Management, Periphyton, Yeasts, Fish, Water pollution effects.
Identifiers: Upwarping, Cladophora fracta, Asterionella, Synedra, Melosira, Cyclotella, Fragilaria, Stephanodiscus, Pediastrum, Anabaena, Oscillatoria, Seasonal pulses, Tectonic changes, Phycomycetes, Phytogeography.

The literature regarding vegetational changes in Lakes Erie and Ontario is reviewed. Most studies dealing with periphyton have been taxonomic; studies of macrophytobenthos, more extensive, though usually lacking in continuity, make effective comparisons with past conditions difficult. With glacial recession and land rebounding, changes in water depth are probably too gradual to cause the observed gross vegetational changes; long-range climatic changes are also likely to have been too slow for great effects in the period observed. Occurrence of heavy storms, seiches, fluctuations of sunshine and precipitation, and other short-range weather variables affect aquatic vegetation. Direct or indirect effects upon benthic plants through human activities (introducing foreign fish species and other organisms) have been observed. Summaries of phytoplankton studies indicate that very few offer detailed, reliable conclusions concerning plant community changes over the years. Long-range changes in dominant phytoplankters were demonstrated. There is evidence of rapid artificial eutrophication of Lake Erie. In both lakes, further quantitative seasonal studies of phytoplankton are needed. Phytogeographic problems are important. More is learned regarding water masses by examining planktonic biota than by sensitive chemical and physical measurements. Ecosystems must be clearly understood if they are to be intelligently managed for long-range benefits of mankind. (See W70-01942). (Jones-Wisconsin)

CHANGES IN THE BENTHOS OF LAKES ERIE AND ONTARIO,
Toronto Univ. (Ontario). Dept. of Zoology.
Ralph O. Brinkhurst.
Bulletin of the Buffalo Society of Natural Sciences, Vol 25, No 1, p 45-71, 1969. 11 fig, 21 ref.

Descriptors: *Lake Erie, *Lake Ontario, *Benthos, Oxygen, Eutrophication, Oligotrophy, Fish, Temperature, Pollution abatement, Mayflies, Oligochaetes, Tubificids, Currents (Water), Depth, Sodium, Sampling, Great Lakes region, Water pollution effects, Bioindicators.
Identifiers: *Biotic changes, Pontoporeia, Hyalella, Sphaeriid mollusks, Chironomids, Lumbriculidae, Pisidium forms.

Species composition of chironomid and oligochaete fauna in deepest parts of Lakes Erie and Ontario and Georgian Bay is fairly consistent with Beeton's trophic classification of these three lakes. The bottom fauna of Lake Erie suggests a west to east gradient from extremely eutrophic to moderately oligotrophic conditions. A similar south to north gradient is, at least partly, a reflection of temperature. Lake Ontario fauna suggests oligotrophy with possibly an eutrophic shore zone. Oxygen determinations of 10 years ago would be valuable. In grossly polluted situations, numbers of oligochaetes stay high; representatives of other groups may be scarce. Commonest oligochaete under such conditions is Limnodrilus hoffmeisteri. Proportion of oligochaetes to other forms of life, and the percentage of Limnodrilus hoffmeisteri in relation to all oligochaetes may be guides to degree of organic pollution. Difficulties in discussing the chironomid fauna include problems of nomenclature and systematics. The bottom fauna, potentially a good indicator of qualitative change, has been studied only superficially in the past. Since hard parts of chironomid larvae preserve well in lake sediments, core analyses might provide information on whether the distributions represent recent developments. (See W70-01942). (Jones-Wisconsin)
W70-01945

STUDIES OF THE PHYSIOLOGY AND ECOLOGY OF SPHAEROTILUS NATANS,
Oregon Agricultural Experiment Station, Corvallis.
H. K. Phinney, C. D. McIntire, W. H. Reese, J. M. Robertson, and C. E. Warren.
Terminal Report, Submitted to the Northwest Pulp and Paper Association, Mar 1, 1967. 31 p 16 tab, 4 fig, 4 ref.

Descriptors: *Sphaerotilus, *Sewage bacteria, *Water temperature, *Hydrogen ion concentration, *Nutrients, *Periphyton, *Ecology.
Identifiers: *Cell morphology, *Metabolic pathways, *Temperature and growth, *pH and respiration, *Nutrition of Sphaerotilus Laboratory communities, Isolation techniques, Culture techniques, Field methods.

Studies on the morphology, physiology and ecology of Sphaerotilus in the Laboratory and artificial streams were conducted. Amount of sheath material enclosing cells varied inversely with the amount of peptic and casamino acids in the culture medium. In pure culture Sphaerotilus grew at temperature of 3 to 35C and in the stream at 2C. Maximum rate of respiration at a pH of 7.5; no oxygen consumption at pH 6.0 and 5.7. Growth characteristics in a stream were observed and the population size depended on the supply of sucrose and urea. Diversity of other organisms was greater in areas of stream with little Sphaerotilus. Biomass of snails was greater; benthic insects were more abundant and trout production was greater in sections of the stream where Sphaerotilus was abundant. (Katz-Washington)
W70-01994

THE ACUTE TOXICITY OF SOME HEAVY METALS TO DIFFERENT SPECIES OF AQUATIC INSECTS,
National Water Quality Lab., Duluth, Minn.
STEPHEN L. Warnick, and H. L. Bell.
Journal Water Pollution Control Federation, Vol 41, No. 2, Part 1, p 280-284, Feb 1969. 3 tab, 12 ref.

Descriptors: *Copper, *Metals, *Aquatic insects, *Toxicity, Mayflies, Caddisflies, Fish food organisms, Bioassays.
Identifiers: *Iron salts, *Zu salts, *Cadmium salts, *Lead salts, *Copper salts, *Nickel salts, *Cobalt salts *Chromium salts, *Mercury salts, Stoneflies.

In static bioassays the acute toxicity of Cu, Zn, Cd, Pb, Cr, Hg, Co, Ni, and Fe salts on three species of stoneflies, mayflies and caddisflies was determined. The median tolerance limits of the metal salts for these organisms was determined. The mayfly was the most sensitive of the insects tested to all of the metals used. Insects seemed to be more tolerant than many species of fish. In the experimental procedures used, the 02, pH, and hardness remained fairly constant and these factors did not seem to influence mortalities. (Katz-Washington)
W70-01995

THE TOXICITY OF ENDRIN-RESISTANT MOSQUITOFISH TO ELEVEN SPECIES OF VERTEBRATES,
Mississippi State Univ., State College. Dept. of Zoology.
Peter Rosato, and Denzel E. Ferguson.
BioScience, Vol 18, No 8, p 783-784, Aug 1968. 1 tab, 4 ref. USPHS Grant No, UI 00348-01.

Descriptors: *Endrin, *Resistance, *Pesticide toxicity, DDT, Pesticides, Prey fish, Predation, Pesticide residues.
Identifiers: *Mosquitofish.

Mosquitofish and 5 additional species of fish were found resistant to a variety of chlorinated hydrocarbon insecticides. This study demonstrates the potential hazard of endrin-exposed resistant mosquitofish to eleven species of vertebrates. Resistant mosquitofish containing an average of 890.02 ppm of endrin were force-fed to redfin, pickerel, largemouth bass, bluegills, bullfrogs, redeared turtles, water snakes (several species), purple grackles, starlings, and quail. Controls, two of each species tested, were fed endrin-susceptible mosquitofish containing no pesticides. All controls survived and exhibited no symptoms of discomfort. Approximately 95% of the eleven species tested died from eating one endrin-treated fish. Findings show that resistant mosquitofish tolerate endrin residues sufficient to kill predators several hundred times their own weight. (Sjolseth-Washington)
W70-01996

EFFECTS OF FOREST SPRAYING WITH DDT ON AQUATIC INSECTS OF SALMON STREAMS IN NEW BRUNSWICK,
Toronto Univ. (Ontario). Dept. of Zoology.
F. P. Ide.
J Fish Res Bd, Canada, Vol 24 (4), p 769-805, 1967. 12 fig, 22 ref, 6 append.

Descriptors: *DDT, *Aquatic insects, Fish food organisms, Mayflies, Stonflies, Caddisflies, Pesticide toxicity.
Identifiers: *Salmon populations, Forest spraying, Spruce budworm, Miramichi river, Insect drift collections, Daily insect emergence, Recover, Bottom fauna.

Sampling of emerging aquatic insects by cage-traps on a 24-hr basis showed the effects on the stream fauna of spraying forests with DDT at 1/2 lb/acre in June. Except for a few individuals that presumably emerged from unaffected pupae and nymphs, there was an interval of several weeks after spraying when no emergency occurred. From about the middle of August, however, large populations of very small insects, mainly chironomids, emerged in the spray year. The year after spraying, as compared with the spray year, there was an increased variety including some larger species. In following years there was further recovery by increase in larger forms through reproduction from residual small populations. From the standpoint of feeding of the young salmon, significant facts are: (a) the severe reduction in the bottom fauna of larvae and nymphs of all sizes in the first weeks after spraying, (b) the large populations of small larvae, mainly chironomids, developing in late summer of the spray year and so available to fry; (c) increasing numbers of larger insects the year after spraying and subsequent years. (Sjolseth-Washington)

TOXICITIES OF FOUR INSECTICIDES TO RESISTANT AND SUSCEPTIBLE MOSQUITOFISH IN STATIC AND FLOWING SOLUTIONS,
Mississippi State Univ., State College. Dept. of Zoology.
W. David Burke, and Denzel E. Ferguson.
Mosquito News, Vol 29, No 1, p 96-101, Mar 1969. 2 fig, 12 ref. Grants ES 00086 and UI 00348 from U.S. PHS.

Descriptors: *Pesticide toxicity, Bioassay, DDR, Endrin, Resistance, Fishkill, Insecticides.
Identifiers: *Static tests, *Flowing tests, Mosquito fish, Toxaphene, Parathion, Population susceptibility.

The toxicity of parathion, toxaphene, DDT, and endrin in static and flowing test solutions to resistant and susceptible strains of mosquitofish was determined. Mortality-concentration curves and time-mortality curves were constructed. In both static and flowing tests, mortality was greater in susceptible fishes than in resistant fishes. The toxicity of a given concentration of DDT, toxaphene, and endrin is greater in flowing solutions than in static solutions. Parathion does not produce the same mortality pattern in resistant fish as do DDT, endrin and toxaphene. This is thought to result from the generation of a metabolite more toxic than parathion itself. This metabolite may be removed from the flowing system at a rate to preclude its buildup to toxic levels. The authors discuss the merits of static and flowing tests. (Sjolseth-Washington)
W70-02000

EFFECTS ON AQUATIC INSECTS OF FOREST SPRAYING WITH PHOSPHAMIDON IN NEW BRUNSWICK,
Fisheries Research Board of Canada, St. Andrews (New Brunswick). Biological Station.
C. D. Grant.
J Fish Res Bd Canada, Vol 24 (4), p 823-832, 1967. 9 fig, 2 tab, 5 ref.

Descriptors: *Aquatic insects, DDT, Diptera, Bottom sediments, Aquatic Populations, Pesticide toxicity.
Identifiers: *Phosphamidon, Aerial spraying, Spruce budworm, Emergence pattern, Insect drift collections.

No harmful effects on aquatic insects were detected in two New Brunswick streams after forest spraying with phosphamidon (1/2 - 1 lb/acre) in 1962 and 1963. Comparison of one pre-spray and two post-spray series of bottom samples showed no reduction in number or orders (and families in the case of Diptera) and no abnormal decline in the number of individuals. In numbers and variety of insects emerging daily into stream cages and of insects drifting onto vertical screens in the streams, no charges were attributable to phosphamidon. (Sjolseth-Washington)
W70-02001

SOME ENDRIN RELATIONSHIPS IN RESISTANT AND SUSCEPTIBLE POPULATIONS OF GOLDEN SHINERS, NOTEMIGONUS CRYSOLEUCAS,
Mississippi State Univ., State College. Dept. of Zoology.
J. Larry Ludke, Denzel E. Ferguson, and W. David Burke.
American Fish Soc Trans, Vol 97 (3), p 260-263, July 1968. 3 tab, 1 fig, 10 ref.

Descriptors: *Endrin, *Pesticide toxicity, Pesticide residues, Shiners, Resistance, Bioassay.
Identifiers: Endrin resistance, Resistant Populations Susceptible Populations

A 1000 ppb endrin solution killed 50 susceptible golden shiners in 75 minutes but only 40 of 50 resistant shiners in 40 hr. Endrin residues in whole bodies of resistant shiners killed in endrin were as much as 82 times those of susceptible shiners. The endrin concentrations in the blood of living resistant shiners were as much as 64 times greater than those of endrin-killed susceptible shiners. We conclude that the use of a critical concentration in the blood for diagnosis of endrin-caused mortality must be based on the tolerances of local populations and may be invalid when applied to an entire species containing resistant populations. (Sjolseth-Washington)

5D. Waste Treatment Processes

PERFORMANCE OF POROUS CELLULOSE ACETATE MEMBRANES FOR THE REVERSE OSMOSIS TREATMENT OF HARD AND WASTE WATERS,
Ottawa Pollution Control Center (Ontario); and National Research Council of Canada, Ottawa (Ontario). Div. of Applied Chemistry.
Andrew R. Hauck, and S. Sourirajan.
Environ Sci and Technol, Vol 3, No 12, p 1269-1275, Dec 1969. 7 p, 1 fig, 8 tab, 17 ref.

Descriptors: *Water treatment, *Desalination processes, *Water reuse, *Waste water treatment, *Reverse osmosis, Demineralization, Membranes, Membrane processes, Ions, Solutes, Industrial wastes, Reclaimed water, Alkylbenzene sulfonates.
Identifiers: Deionization.

The performance of a few typical Loeb-Sourirajan type porous cellulose acetate membranes is reported for the treatment of hard, polluted, and sewage waters. The membranes used are specified in terms of pure water permeability constant and solute transport parameter for sodium chloride. Using feed waters containing 300- to 800 ppm hardness, product waters containing 2 ppm or less could be obtained with 90% product recovery and an average initial flux of 38 gpd per sq foot at 1000 psig. The possibility of producing 'ultrapure' waters by repeated reverse osmosis processing is indicated. The separation of common pollutants such as nitrates, borates, fluoride, alkyl benzene sulfonate (ABS), ammonia, phosphates, and a few others usually present in plating wastes, and the ap-

plicability of the reverse osmosis process for the treatment of sewage waters and water renovation are illustrated. (Knapp-USGS)

FACTORS RESPONSIBLE FOR NON-BIODEGRADABILITY OF INDUSTRIAL WASTES,
Texas A and M Univ., College Station. Dept. of Civil Engineering, and Rice Univ., Houston, Tex.
Robert L. Irvine, and Arthur W. Busch.
J Water Pollut Contr Federation, Vol 41, No 11, Part 2, p R482-R491, Nov 1969. 10 p, 2 fig, 25 ref.

Descriptors: *Biodegradation, *Industrial wastes, *Waste treatment, Water chemistry, Oxidation, Chemical oxygen demand, Biochemical oxygen demand, Biological treatment, Sewage treatment.
Identifiers: Non-biodegradable wastes.

Feedback from biochemistry can allow introduction of innovative concepts in biological waste treatment. The specific problem treated deals with the meaning of 'non-biodegradability' and the possible means of biologically removing 'non-biodegradable' materials. The analysis is divided into three categories: (1) Low molecular weight compounds originally present in the influent stream waste. (2) Intermediates and end-products of biological activity found in the effluent waste stream. (3) High molecular weight compounds. After each analysis, a brief discussion indicates how these concepts may be used to develop new treatment practices. (Knapp-USGS)

J Water Pollut Contr Federation, Vol 41, No 11, Part 2, p R383-R391, Nov 1969. 9 p, 4 fig, 3 tab, 9 ref.

Descriptors: *Permeability, *Oxidation lagoons, *Water quality, *Sodium, *Clays, Ion exchange, Clay minerals, Expansive clays, Linings, Seepage, Leakage, Water loss, Soil chemistry.
Identifiers: Sodium absorption ratio.

The different sealing effects of various sodium adsorption ratios, found in natural water supplies, on wastewater stabilization ponds were determined. Ten soil samples were studied and classified. Changes in permeability constants were determined for each sample using waters with sodium adsorption ratios of 0, 10, 40, and 80. The results indicated that the sodium adsorption ratio of the applied wastewater can influence the permeabilities of stabilization pond soils. The normal correlation was one of decreasing permeability as the sodium adsorption ratio was increasing. Greater ion exchange effects were disclosed in soils having lower liquid limits. (Knapp-USGS)

DEGRADATION OF SELECTED CHLORINATED HYDROCARBON INSECTICIDES,
Auburn Univ., Ala. Dept. of Civil Engineering.
Gerald M. Leigh.
J Water Pollut Contr Federation, Vol 41, No 11, Part 2, p R450-R460, Nov 1969. 11 p, 3 fig, 3 tab, 33 ref.

Descriptors: *Biodegradation, *Pesticides, *Chlorinated hydrocarbon pesticides, Gas chromatography, Water pollution treatment, Heptachlor, DDT, Endrin, Path of pollutants, Water chemistry.
Identifiers: Lindane.

The chemical and biological degradation of selected chlorinated hydrocarbon insecticides in aqueous solution was studied by means of electron-capture gas chromatography. Lindane, heptachlor, DDT, and endrin were subjected to the action of the oxidants chlorine, potassium permanganate, and potassium persulfate. None of the oxidants were effective in removing lindane or endrin. Less than 20-percent DDT removals were observed using potassium permanganate or potassium persulfate. Potassium permanganate removed more than 80 percent of the heptachlor in less than 5 hr. Alkaline decomposition of lindane and DDT was observed. Biological studies revealed that lindane is not subject to aerobic biodegradation. Heptachlor decomposes in aqueous solution to 1-hydroxy chlordene and an undetermined compound. Heptachlor removals as large 99.4% were observed to occur within 4 days. (Knapp-USGS)

EVALUATION OF BRINE DESULFATING PROCESS AS APPLIED TO DESALINATION PHASE I,
Catalytic Construction Co., Philadelphia, Pa.
G. P. Gelblum, W. Pechenick, and C. E. Ennis.
OSW R AND D Progr Rept No 289, Oct 1967. 42 p, 8 tables, 9 fig, 5 ref.
Identifiers: *By-product manufacturing processes, *Economic evaluations, *Feedwater treatment, Capitalized costs, Chemical by-products, Conceptual designs, Design, Flowsheets, Ion exchangers, Removal from feedwater, Sulfate, Scale prevention, Wrightsville Beach plant.

An adaptation of a brine desulfating process originally conceived by the Salt Lake Metallurgy Research Center of the Bureau of Mines was made to treat desalting plant feedwater. Sulfate removal, achieved by treatment with barium resins, was adequate to permit brine temperatures in excess of 350 deg F. By-products in the form of caustic soda, soda ash, and sulfuric acid produce a credit equal to 7 cents/1000 gal of product water from a desalter in the 50-mgd range. Construction and operating costs are detailed.

CALCIUM SULFATE SCALING IN SALINE WATER DISTILLATION,
Monsanto Research Corp., Everett, Mass.
C. H. Lu, and B. M. Fabuss.
Ind Eng Chem Process Design Develop 7, p 206-12, 1968. 7 fig, 4 tab, 31 ref.
Identifiers: *Physical chemistry of scale, *Scaling, Feedwater treatment, Literature surveys, Removal from feedwater, Calcium, Scale prevention, Thermodynamics.

A calculated solubility diagram for calcium sulfate in sea water concentrates is presented. Precipitation limits of calcium sulfate in sea water of different concentrations, determined by heating and evaporation experiments, are given. Great differences in precipitation limits and scale formation were observed in heating (nonboiling heat transfer) and in evaporation (boiling heat transfer) experiments. Effects of the heating surface materials, heating and evaporation rates, residence time, and seeding on the amount of precipitation were very minor. Literature data on scale formation in demonstration plants and pilot plants are presented on the solubility diagram.

ION EXCHANGE PRE-TREATMENT FOR SEA WATER DESALINATION PLANTS,
Maschinenfabrik Augsburg-Nuernberg A.G., Gustavsburg (West Germany).
G. K. Kunz.
Desalination 3, p 363-72, 1967. 24 fig, 1 ref.
Identifiers: *Feedwater treatment, *Ion exchanging, *Physical chemistry of scale, Columns (Process), Distillation processes, Ion exchangers, Scale prevention, Scaling.

A study is made of the dependence of the saturation concentrations of calcium sulphate, anhydrite and hemihydrate modifications on temperatures and concentration factors. The conversion of the hemihydrate phase into the anhydrite phase, whose speed was measured, proved to be of particular importance. Partial softening of seawater by means of ion exchange, using the brine concentrated in the evaporators as a regenerant, reduces calcium ion concentration to such an extent that no deposits occur. Results obtained in discontinuous laboratory experiments show the dependence on the various limiting quantities. The degree of softening can be considerably increased if the ion exchange is carried out continuously, countercurrently. The apparatus used for a typical plant consists of countercurrent columns, the absorption column operating by stages. No pumps are required for the circulation of the resin- regulation is by automatic control of a single valve. The results of the operation of a pilot plant are given with particular reference to the exchange efficiency. The combination with the saturation concentrations of calcium sulphate shows that even with low concentration factors the maximum operating temperatures can be as high as 160 deg C without the solubility limit of the calcium sulphate hemihydrate being exceeded.

POTABLE WATER FROM SEAWATER BY HIGH-TEMPERATURE ELECTRODIALYSIS,
IONICS, Inc., Watertown, Mass.
W. A. McRae.
IN Abundant Nuclear Energy, Proc Symp Gatlinburg, Tenn, Aug 1968. p 269-98, 10 fig, 9 tab, 20 ref. AFC Symp Ser 14 (CONF-680810) 1969.
Identifiers: *Brackish water, *Electrodialysis process, *Water costs estimate, Capitalized costs, Flowsheets, Membrane processes.

Electrodialysis plants which can produce hundreds of millions of gallons daily and which operate at or near ambient temperatures can be installed now. Static tests on membranes at high temperatures show that thermal decomposition of the ion-exchange resin per se will probably not be a serious problem in practical apparatus. The electrical resistances of both membranes and saline water are shown to decrease at a compound rate of about 1%/deg F, and current efficiency is found to be essentially invariant with temperatures. These findings are confirmed by the operation of laboratory electrodialysis apparatus at 180 deg F for up to 4 months at the time this paper was written. Cost are estimated for producing 205 mgd of fresh water from seawater and from brackish water in high-temperature electrodialysis plants integrated with steam-turbine generators. The estimated total cost of producing fresh water from seawater ranges from 44 to 46 cents/1000 gal. Fresh water from 3000 ppm brackish water is estimated to cost 85 cents/1000 gal. Research opportunities are outlined which could reduce the total costs for demineralizing seawater to the range of 20 to 25 cents/1000 gal.

OPTIMIZATION OF ACID WASTE SLUDGE CHARACTERISTICS,
Virginia Polytechnic Inst., Blacksburg. Dept. of Civil Engineering.
J. F. Judkins, Jr. and W. A. Parsons.
J Water Pollut Contr Federation, Vol 41, No 9, p 1625-1634, September 1969. 10 p, 10 fig, 1 tab, 10 ref.

Descriptors: *Optimization, *Acidity, *Waste disposal, *Filtration, *Settling Velocity, Sampling, Design, Sludge treatment, Mixing, Industrial wastes.
Identifiers: Crystal seeding process.

An investigation of the effects of the crystal seeding process on the filterability of lime-sulfuric acid in industrial waste sludges was conducted. The objective of the study was the optimization of the crystal seeding and the provision of information which would be useful for the design of improved processes for the control of water pollution from acid waste charges. Seed dosage, mixing rate, acid concentration and crystal seed age were the variables that were selected for consideration in the investigation. A minimum of three replicate samples were run for individual values of the chosen variables, and the sludge parameters were determined for each sample. Sludge filterability, as measured by specific resistance, and sludge settleability, was determined for each sample. The results implied that crystal seeding could improve the settleability and filterability of sludge formed on lime neutralization of dilute, metal bearing sulfuric acid waste solutions. Optimum values of crystal seed dosage, mixing rate, and acid concentration were formed to be associated with maximum effectiveness of the crystal seeding process. (Thiuri-Cornell)

CHEBYSHEV OPTIMAL WASTE DISCHARGES,
Yale Univ., New Haven, Conn. Dept. of Administrative Sciences.
Matthew J. Sobel.
Dept Admin Sci, Rep No 17, Yale Univ, p 1-28, September 1969. 28 p, 8 ref.

Descriptors: *Waste storage, *Optimization, *Water resources, *Water quality control, *Storage capacity, Discharge (Water), Mathematical models, Waste water disposal.
Identifiers: Chebyshev criterion.

The study provided a model for evaluating alternative schedules for storing wastes and discharging stored wastes into a water resource. Equivalently the model related the capacity of the waste storage facility to whatever base level could be ensured for water quality. Two discrete-time deterministic problems were considered (a) for a given storage capacity, what discharge schedule maximized the minimum water quality during a finite horizon (b) for a given minimum water quality during a finite horizon, what was the smallest storage capacity for which there existed a feasible discharge schedule. The Chebyshev criterion was employed to provide optimal solutions to (a) and (b). The criterion was also exploited computationally to obtain exact solutions to (a) and approximate solutions to (b). (Thiuri-Cornell)

OPTIMIZATION OF THE ION FLOTATION OF DICHROMATE,
Kentucky Univ., Lexington; and Tenco Hydro/Aeroscience Inc., Chicago, Ill.
Robert B. Grieves, Gregory A. Ettelt, J. Thomas Schrodt, and Dibakar Bhattacharyya.
ASCE, J Sanit Eng Div, Vol 95, No SA3, p 515-525, June 1969. 11 p, 5 fig, 2 tab, 10 ref, 2 append.

Descriptors: *Optimization, *Ions, *Flotation, *Surfactants, *Volume, Regression analysis, Waste treatment, Chemicals, Cost analysis, Foam fractionation.
Identifiers: Dichromate.

The efficiency of a pilot-plant scale, dissolved-air ion flotation unit for the removal and concentration of dichromate was evaluated. The evaluation was dependent on three variables: the fractional flotation (removal) of dichromate, the enrichment ratio for dichromate, and the fractional flotation (removal) of surfactant. Each dependent variable was related analytically to five independent variables by multiple regression analysis. Optimum values of the independent variables were determined and a chemical cost estimate based on the removal of chromium was carried out. The prime advantage of the ion flotation process was the concentration of the chromium present in the waste (together with the surfactant added) in a small liquid volume of collapsed foam. Chromium was concentrated in a liquid volume less than one per cent of the volume of the waste. (Thiuri-Cornell)

RECLAIMING SEWAGE EFFLUENT,
Arizona Univ., Tucson. Water Resources Center.
L. G. Wilson, and G. S. Lehman.
Progressive Agriculture in Arizona, Vol 19, No 4, July-Aug 1967, p 22-24. 2 fig.

Descriptors: *Sewage treatment, *Arizona, *Filtration, *Bermudagrass, *Chemical oxygen demand, Sewage effluents, Tertiary treatment, Waste water treatment, Biochemical oxygen demand, Water quality, Water reuse, Reclaimed water.

The authors report preliminary results of three trials of the effectiveness and durability of grass plot filters for tertiary treatment of municipal sewage effluent under Arizona conditions. It was found that grass height and density should be great enough to ensure true filtration. Bermudagrass can tolerate prolonged flooding with sewage effluent. A substantial part of the effluent percolated downward from the filter plots toward the water table. Therefore, subsurface materials would act as soil filter for part of the effluent. COD (Chemical Oxygen Demand) was found to be a more reliable measure than BOD (Biological Oxygen Demand) in samples containing high algae content. Outlet COD values were consistently lower than inlet values, indicating that the units acted as true filters. (Crouse-Arizona)

SECONDARY EFFLUENT DEOXYGENATION AT DIFFERENT TEMPERATURES,
Marquette Univ., Milwaukee, Wis. Dept. of Civil Engineering.
A. E. Zanoni.
Journal Water Pollution Control Federation, Vol 41, No 4, p 640-659, Apr 1969. 11 fig, 2 tab, 23 ref.

Descriptors: *Biochemical oxygen demand, *Nitrification, Temperature, Biological treatment, Sewage effluents, Sewage treatment.
Identifiers: Carbonaceous deoxygenation, Arrhenius expression, Jug dilution technique, Reaction rates.

The effect of temperature on the rate of deoxygenation of raw wastewater has been examined frequently. There is evidence to indicate, however, that secondary effluents do not necessarily behave in a similar manner. In this study, the relationship between temperature and the rate of both the carbonaceous and the nitrogenous deoxygenation of an effluent from a conventional activated sludge wastewater treatment plant is determined. A 'jug' dilution technique was used for the biochemical oxygen demand determinations. Numerous nitrite and nitrate-nitrogen analyses also were conducted to establish the kinetics of the nitrogenous phase of deoxygenation. The resulting data are employed primarily to calculate the temperature coefficient of the modified Arrhenius expression. The dependence of both the first and second stage ultimate demands on temperature is investigated. The first-stage rate constant increased 11.5% per C deg from 5 to 10 deg C, 6.9% per C deg from 10 to 26 deg C, and decreased 2.1% per C deg above 26 deg C. The second stage-rate constant increased 9.2% per C deg from 10 to 20 deg C, and decreased 5.5% per C deg from 20 to 30 deg C. The ultimate demands did not vary significantly with temperature. The nitrification lag time was a strong function of temperature, being 4 days at 30 deg C and 16 days at 10 deg C. (Rietveld-Vanderbilt)

WASTE WATER DEOXYGENATION AT DIFFERENT TEMPERATURES,
Marquette Univ., Milwaukee, Wis. Dept. of Civil Engineering.
A. E. Zanoni.
Water Research, Vol 1, p 543-566, Aug-Sept, 1967. 13 fig, 2 tab, 34 ref.

Descriptors: *Biochemical oxygen demand, *Sewage, *Temperature.
Identifiers: Deoxygenation constants, Deoxygenation activity, Dilution technique, First stage velocity constant, Ultimate oxygen demand, Arrhenius expression, Second order reaction rate equation.

A large number of biochemical oxygen demands (BOD) determinations were conducted on a raw municipal sewage using the dilution technique and at incubation temperatures ranging from 2 to 40 deg C. At incubation temperatures of 20 deg C and above, BOD determinations were conducted at one-sixth, one-third, one-half, 1, 3, 5, and 7 days. At lower temperatures, determination under one day were not conducted, though these test runs were extended for much longer periods. The data were used to evaluate the first stage velocity constant, k, and ultimate demand, L, of the first-order deoxygenation expression, and these, in turn, were related to temperature. It was found that k increased by 12.6% per C deg from 2 deg to 15 deg C, by 4.7% per degree from 15 deg to 32 deg C, and decreased by 1.5% per C deg from 32 deg to 40 deg C. The ultimate demand also varied with temperature above 20 deg C. It was also found that the deoxygenation kinetics could be more accurately described by a second order reaction rate equation than by the conventional first order equation. (Rietveld-Vanderbilt)

CHARACTERIZATION OF SETTLING TANKS BY EDDY DIFFUSION,
Engineering-Science, Inc., Oakland, Calif. Research and Development Lab.
Hassan M. El-Baroudi.
J Sanit Eng Div, Proc Amer Soc Civil Eng, Vol 95, No SA3, Proc Paper 6618, p 527-544, June 1969. 12 fig, 15 ref.

Descriptors: *Diffusion, *Settling basins, *Sedimentation, Turbulence, Mathematical models, Sanitary engineering, Analysis.
Identifiers: *Turbulent diffusion, Eddy diffusion, Models, Similarity, Hazen number, Camp number.

A model settling basin study is described of eddy diffusion by using radioactive tracers. A derivation is presented of an eddy diffusion equation based on random dispersion (the normal distribution). The inlet structure gives near ideal mixing; therefore, the source is assumed to be an exponentially-decreasing extended source. The calculated and observed concentrations with time are graphically presented. A similarity rule is proposed for modeling settling tanks. The rule uses both Hazen and Camp numbers for the model and the prototype and approaches Reynold's law as the coefficient of eddy diffusion increases. (Ledbetter-Texas)

A CASE OF FILAMENTOUS ACTIVATED SLUDGE,
Instituut voor Gezondheidstechniek TNO, The Hague (Netherlands).
A. Pasveer.
J Water Pollut Contr Federation, Vol 41, No 7, p 1340-1352, July 1969. 10 fig, 2 tab, 13 ref.

Descriptors: *Fungi, *Activated sludge, *E. coli oxidation lagoons, Sphaerotilus, Wastewater treatment, Aeration.
Identifiers: *The Netherlands, *Filamentous growth, Bulking, Ribonucleic acids, Deoxyribonucleic acids.

A case of light sludge in the oxidation ditch of the Sancta Maria hospital in The Netherlands was investigated. To treat the normal domestic wastewater (15 cu m/hr, 500 mg/l BOD) emanating from the hospital, a 450-cu m oxidation ditch had been constructed. During operation a heavy filamentous growth caused bulking and poor operation. Although past research indicated that the bulking organisms might be Sphaerotilus, laboratory tests under conditions simulating those that were felt to exist in the continuous-fed, constantly aerated oxidation ditch indicated that the organism responsible was filamentous-shaped E. coli. The author presents reasons for this assumption and includes microphotographs. Elimination of the filamentous organisms was accomplished by intermittent feeding (60 cu m/hr for 1 hr) followed by 4-hr aeration, 1-hr sedimentation, and then repeating. (Ledbetter-Texas)

BRITISH PRACTICE IN THE TERTIARY TREATMENT OF WASTEWATER,
Watson (J. D. and D. M.), London (England).
H. R. Oakley, and Terence Cripps.
J. Water Pollut Contr Federation, Vol 41, No 1, p 36-50, Jan 1969. 5 fig, 4 tab, 13 ref.

Descriptors: *Tertiary treatment, *Wastewater, *Lagoons, Phosphates, Standards, Filtration, Legislation, Irrigation.
Identifiers: *Microstraining, *British Isles, Rapid sand filtration, Slow sand filtration, Phosphate removal, Nitrogen removal, Pebble bed clarifiers.

British practice is reviewed in the tertiary treatment of wastewater and specific examples are described with particular reference to experience with effluent lagoons at the Rye Meads Works of the Middle Lee Regional Drainage Scheme. A brief historical review serves to indicate the factors which have governed the methods adopted and is followed by a description of current practice in effluent polishing by land irrigation, microstraining, and sand filtration, and effluent lagoons. A critical comparison is made of these methods. The design and performance of the effluent lagoons at the Rye Meads Works is described in some detail and there is discussion of the current investigations on the control of algae in lagoons and receiving streams. PHOSPHATE REMOVAL BY A LIME-BIOLOGICAL TREATMENT SCHEME,
Kansas State Univ., Manhattan; and Kansas Univ., Lawrence.
Lawrence A. Schmid, and Ross E. McKinney.
J Water Pollut Contr Federation, Vol 41, No 7, p 1259-1276, July 1969. 10 fig, 3 tab, 9 ref.

Descriptors: *Biological treatment, *Phosphorus, *Lime, *Phosphates, Costs, Nutrients, Wastewater treatment.
Identifiers: *Cell synthesis, *Lime regeneration, *Sludge production, pH.

A process (based on laboratory studies) is proposed for the removal of phosphorus from domestic wastewater by lime treatment of effluent by a high-rate, complete mix activated sludge process. This treatment allows for partial removal of the phosphorus by the lime with the activated sludge organisms removing the remaining portion by synthesis into cell mass. The addition of 150 mg/l calcium hydroxide to raw waste-water resulted generally in a pH of 9.5 phosphate removals of 80 percent, BOD removals of 60 percent, and SS removals of 90 percent. The activated sludge process was found to operate satisfactorily on the lime-treated wastewater, and microbial production of carbon dioxide in the activated sludge unit was sufficient to maintain a pH near neutral in the aeration compartment. ADVANCED WASTEWATER CONTROL SYSTEM,
Yeomans Brothers Co., Melrose, Ill.
Edward F. Bradley.
J Water Pollut Cont Federation, Vol 41, No 7, p 1292-1298, July 1969. 3 fig, 2 ref.

Descriptors: *Wastewater, *Lagoons, *Monitoring, *Wastewater treatment, Disinfection, Instrumentation, Ultraviolet radiation.
Identifiers: *Research project, *St. Michaels, Maryland, Effluent shutoff, Continuous monitoring, Automatic monitoring.

Because, from a public health standpoint, the effluent from a normally operated domestic wastewater treatment plant has adverse effects on the receiving water, a new treatment process has been developed which provides for effective pathogen removal and absolute continuous control over the quality of the treatment plant effluent. This treatment is accomplished by controlled flow, continuous automatic equipment monitoring, continuous automatic evaluation of the degree of treatment provided, detection of equipment malfunction, instantaneous notification of authorities, and automatic stoppage of flow to the receiving waters. A research project at St. Michaels, Maryland, is expected to provide sufficient test data to verify the validity of the system under full-scale conditions, and also should demonstrate the usefulness of ultraviolet light as a means of disinfection comparable to present chlorination methods. (Ledbetter-Texas)
W70-01978

STRUCTURAL DETERMINANTS IN THE OXIDATION OF ALIPHATIC COMPOUNDS BY ACTIVATED SLUDGE,
Ohio State Univ., Columbus. Dept. of Microbiology.
George W. Malaney, and Robert M. Gerhold.
J Water Pollut Contr Federation, Vol 41, No 2, Part 2, p R18-R33, Feb 1969. 12 fig, 7 tab, 30 ref.

Descriptors: *Activated sludge, *Amino acids, *Oxidation, Wastewater treatment.
Identifiers: *Aliphatic compounds, *Columbus (Ohio), Nitriles, Amides, Amines, Carboxylic acids.

The abilities are delineated of 3 activated sludges (Columbus, Ohio) to oxidize the following chemical families: saturated monocarboxylic acids; saturated and unsaturated hydroxy and keto dicarboxylic acids; nitriles; amides; amines; and amino acids. They used a Warburg respirometer with chemical concentrations up to 500 mg/l and solids of 2500 mg/l. They found that saturated mono-carboxylic acids were oxidized immediately; unsaturation in long-chain mono-carboxylic acids increases oxidation amenability; most di-carboxylic acids resist oxidation; the cyanide group decreases oxidation; aliphatic amines were toxic; and amino acid oxidation varied greatly. KINETICS OF SUBSTRATE UPTAKE IN PURE AND MIXED CULTURE,
Massachusetts Inst. of Tech., Cambridge. Dept. of Nutrition and Food Science.
R. I. Mateles, and S. K. Chian.
Environ Sci Technol, Vol 3, No 6, p 569-574, June 1969. 13 fig, 21 ref.

Descriptors: *Kinetics, *Activated sludge, *Cultures, Mathematical models, Model studies, Carbon.
Identifiers: *Biokinetics, *Monod equation, *Zero order, Pure culture, Mixed culture, Continuous culture, Glucose, Lactose, Butyrate, Acetate, Steady-state, Residence time, Batch culture.

Laboratory models were used to study the rates of substrate uptake by various microorganism cultures obtained from a local polluted stream. Acetate production amounted to 15 percent of the carbon source used in a glucose-butyrate feed of a culture that was carbon-limited. The growth rate was 1 hr-sups-1 and the dissolved oxygen pressure was 0.1 atm. There have been no previous reports of acetate production by a carbon-limited continuous culture and current theory says th re should be none. The experiments indicate that complete analysis of media leaving a continuous culture or activated sludge process is necessary because of the appearance of catabolites in the effluent. Acclimatization should be carried out under flow conditions identical to those for the test. The steady state condition was reached after 10 to 25 residence times rather than the 5 or 6 usually reported. (Ledbetter-Texas)

REMOVAL OF NITROGEN AND PHOSPHORUS FROM WASTE WATER,
Stanford Univ., Calif.
Rolf Eliassen, and George Tchobanoglous.
Environ Sci Technol, Vol 3, No 6, p 536-541, June 1969. 2 tab, 15 ref.

Descriptors: *Nutrients, *Nitrogen, *Phosphorus, Efficiencies, Cost comparisons, Treatment, Biological treatment, Algal control, Ammonia, Ion exchange, Reverse osmosis, Distillation, Electrodialysis, Sorption, Chemical precipitation, Ultimate disposal.
Identifiers: *Nutrient removal, *Eutrophication, Anaerobic denitrification, Land application, Electrochemical treatment, Ammonia stripping, Algae harvesting.

The principal sources of nitrogen and phosphorus in wastewaters are tabulated with the amounts from each source; domestic and agricultural operations are on a par with industrial output for nitrogen discharges, but phosphorus releases by industry are not available. Nitrogen removal may be done by the following processes with removal efficiencies and cost in dollars per million gallons in parentheses: ammonia stripping (80-98, 9-25), anaerobic denitrification (60-95, 25-30), algae harvesting (50-90, 20-35) and conventional biological treatment (30-50, 30-100). A similar list for phosphorus removal follows: modified activated sludge (60-80, 30-100), chemical precipitation (88-95, 10-70), chemical precipitation with filtration (95-98, 70-90), and sorption (90-98, 40-70). In addition, the conventional biological treatment removes 10-30 percent of the phosphorus. A list of the treatment schemes for removal of both nitrogen and phosphorus is the following: ion exchange (80-92, 86-98, 170-300), electrochemical treatment (80-85, 4-8 for power), electrodialysis (30-50, 100-250), reverse osmosis (65-95, 250-400), distillation (90-98, 400-1000), and land application (60-90 phosphorus, 75-150). Ultimate disposal methods may be classified into 4 groups: dumping; subsurface injection; conversion and dumping; and conversion, product recovery, and dumping. (Ledbetter-Texas)

EXPERIENCE IN PROVIDING FOR SAFETY ASPECTS IN TREATMENT PLANT DESIGN,
Black and Veatch, Kansas City, Mo.
Lloyd W. Weller.
J Water Pollut Contr Federation, Vol 11, No 1, p 122-125, Jan 1969. 5 tab, 2 ref.

Descriptors: *Safety, *Accidents, *Design, *Wastewater treatment, Ventilation, Operation and maintenance, Explosions.
Identifiers: *Treatment plant design, Handrails, Kickplates, Toxic gas, Asphyxiation, Fires, Eye baths, Gas masks, Chlorine leak detectors.

Although an organized effort exists to promote safety in wastewater plants, the safety record of the wastewater field indicates there is urgent need for improvement. Designers must review their thinking and their design procedures to make sure that the safety of operating personnel is given prime consideration in the layout and arrangement of wastewater works. A review of two existing plants and their accident records, however, does suggest that most accidents have their cause in something other than a direct physical deficiency. Because the operation of water pollution control facilities makes exacting and varied the demands on the operating personnel, a total-environment approach toward accident prevention in the wastewater treatment facilities must be made. THE SLUDGE VOLUME INDEX--WHAT IS IT,
Illinois Univ., Urbana; and North Carolina Univ., Chapel Hill.
Richard I. Dick, and P. A. Vesilind.
J Water Pollut Contr Federation, Vol 41, No 7, p 1285-1291, July 1969. 9 fig, 9 ref.

Descriptors: *Sludge, *Wastewater treatment, *Rheology, *Settling velocity, Activated sludge, Testing.
Identifiers: *Sludge volume index (SVI), Control tests, Thickening, Settling characteristics, Compression characteristics.

Although the sludge volume index (SVI) has become the standard measure of the physical properties of activated sludge, it is possible for sludges with identical SVI values to have vastly different physical properties. The SVI value for a sludge is not consistently related to the settling velocity, compression characteristics, suspended solids concentration, or rheological characteristics of the sludge. Futhermore, results of SVI tests are not indicative of settling characteristics in settling basins. The sludge volume index is a convenient control test in the operation of activated sludge plants, but comparisons of SVI values from various plants are not meaningful. The parameter is not suitable for research applications, and cannot be used to predict recycle requirements or mixed liquor suspended solids concentrations in the activated sludge process. It is suggested that alternate, more meaningful measurements of the physical characteristics of activated sludge be used where possible. (Ledbetter-Texas)

MANASSAS, VA., ADDS NUTRIENT REMOVAL TO WASTE TREATMENT,
Federal Water Pollution Control Administration, Cincinnati; Wiley and Wilson; and Prince William County, Va.
M. C. Mulbarger.
Water Wastes Eng, Vol 6, No 4, p 46-48, Apr 1969. 2 fig, 13 ref.

Descriptors: *Nutrients, *Phosphorus, *Nitrogen, Municipal wastes, Pilot plants, Nitrification, Denitrification, Sludge digestion.
Identifiers: *Luxury uptake, Chemical treatment, Experimental operation.

An experimental 1.0 mgd plant has been built at Manassas, Va., to study the removal of nutrients from wastewater while giving the waste stabilization treatment. A 0.2 mgd biological nitrification-denitrification pilot plant for nitrogen removal is located at the same site. The process will permit higher overall removals of phosphorus and nitrogen than coventional treatment and will remove the carbonaceous and solids materials in the usual amounts. The units are designed for flexibility of operation to provide experimental operation. Unconventional features of the plant are that it does not have primary clarification, and it uses two-stage turbine aeration, intermediate solid-liquid separation by flotation, and chemical precipitation of the digester supernatant. The phosphorus removal is to be by metabolic means, luxury uptake by microorganisms. (Ledbetter-Texas)

MODERN MONITORING OF A TREATED INDUSTRIAL EFFLUENT,
Procter and Gamble Co., Cincinnati, Ohio. Ivorydale Technical Center.
R. G. Ostendorf.
J Water Pollut Contr Federation, Vol 41, No 1, p 89-98, Jan 1969. 9 fig, 3 ref.

Descriptors: *Monitoring, *Biochemical oxygen demand, *Dissolved oxygen, *Industrial wastes, Wastewater, Evaporation, Incineration, Filtration, Flotation.
Identifiers: *Total carbon, *Suspended solids, *Susquehanna River, pH, Paper wastes, Screening, Composite sampler.

The wastes monitoring system is described installed by the Charmin Paper Products Company at their waste treatment facility. BOD wastes are evaporated then incinerated and fiber-bearing wastes are treated for suspended solids removal by screening, precoat filters, and dissolved air flotation. The wastes monitoring system used to maintain the DO in the Susquehanna River at the prescribed 5.0 mg/l concentration consists of composite sampler, pH recorder, DO and BOD analysis, and continuously indicating suspended solids and total carbon equipment. The total carbon and suspended solids analyzers are described. (Ledbetter-Texas)
W70-01986

FUNDAMENTALS OF ACTIVATED SLUDGE,
Department of Water Resources, New York. Bureau of Water Pollution Control.
A. H. Chasick.
J Water Pollut Contr Federation, Vol 41, No 7, p 1377-1382, July 1969. 1 tab, 1 ref.

Descriptors: *Activated sludge, *Aeration, *Sludge, *Fundamentals, Design data, Domestic wastes.
Identifiers: *Step aeration, *New York City, Overflow rates, Gravity thickeners, Process air, Excess sludge, Aeration tank loadings, Mixed liquor solids.

The operation fundamentals are discussed of activated sludge plants in the New York City area, treating weak-to-normal domestic wastewater. Overflow rates are 800 gpd/sq ft (32.7 cu m/day/sq

m) for tanks 200 to 300 ft (61 to 92 m) long. Return sludge pumps operate at 25 to 30 percent of wastewater flow. Gravity thickeners with maximum diameter of 70 ft (21.4 m) are used, with a design load maximum of 8 lb/day/sq ft (39 kg/day/sq m), to produce a sludge containing 5 to 6 percent solids. The operational parameter is the process air added to the aeration tanks - two mg/l air is kept at the aerator outlet. Aeration tank loading rates are 0.20 to 0.33 lb/day (0.10 to 0.15 kg/day); mixed liquor solids content varies from 960 to 1600 mg/l (6-hr detention, 100 mg/l primary effluent solids). The typical four-pass step aeration process has aeration tank loadings of 50 to 60 lb BOD/1000 cu ft of aeration tank. Excess sludge, sludge index, and final tank loadings are also discussed. (Ledbetter-Texas)
W70-01987

WATER RECLAMATION AT SOUTH TAHOE,
South Tahoe Public Utility District, South Lake Tahoe, Calif.
Russell Culp.
Water Wastes Eng, Vol 6, No 4, p 36-39, Apr 1969. 5 fig, 4 tab.

Descriptors: *Tertiary treatment, *Reclamation, *Water reuse, Activated sludge, Activated carbon, Biochemical oxygen demand, Chemical oxygen demand, Odor, Coliforms, Phosphorus, Turbidity, Filtration.
Identifiers: *Nitrogen stripping, Suspended solids, Color, Operating data, Sludge incineration, Carbon regeneration.

A 7.5 mgd water reclamation plant which employs advanced wastewater treatment practices has been operating for 9 mos with good results. The water is used for irrigation of alfalfa, other hay, and pasture land. There are plans to use the water for contact sports. The process starts with chlorination for odor control, then continues with a conventional activated sludge treatment with some recirculation of lime sludge for phosphorus removal. The effluent from the conventional treatment receives 5 steps of tertiary treatment: flocculation and coagulation with phosphorus removal (lime), nitrogen stripping, recarbonation, filtration, activated carbon columns, and chlorination. The sludges are incinerated with recovery of lime and carbon dioxide. The plant removes nearly 100 percent of the BOD, COD, suspended solids, color, odor, coliforms and turbidity. The removal of phosphorus is about 94 percent and of nitrogen is greater than 50 percent. The spent carbon is regenerated with a loss of about 5 percent per cycle. The water is lifted 270 ft to a storage tank then about 1500 feet more to Indian Creek Reservoir where it is removed for use. (Ledbetter-Texas)
W70-01988

LABORATORY AND PILOT PLANT STUDIES ON PHOSPHATE REMOVAL FROM INDUSTRIAL WASTEWATER,
Hercules, Inc., Wilmington, Del.
Bruce W. Dickerson, and Philip J. Farrell.
J Water Pollut Contr Federation, Vol 41, No 1, p 56-62, Jan 1969. 2 fig, 7 tab, 5 ref.

Descriptors: *Phosphates, *Lime, *Industrial wastes, Pilot plants, Biochemical oxygen demand, Centrifugation, Dewatering.
Identifiers: *Alum, *Ferric sulfate, Lake Huron (Mich), Soda ash, Suspended solids, pH.

Laboratory and pilot plant tests were made to develop a treatment method for a wheat flour waste stream with 300 to 330 mg/l of phosphates and 5000 mg/l BOD. Lab studies showed that lime removed phosphate more efficiently than alum and ferric sulfate. Pilot plant studies showed that a 5 mg/l phosphate concentration is attainable at controlled pH. Centrifugation achieved 20 to 40% solids and appeared most practical. They did not claim this to be an economical process for phosphates removal. (Ledbetter-Texas)
W70-01989

PRIMARY TREATMENT OF POTATO PROCESSING WASTES WITH BYPRODUCT FEED RECOVERY,
Eimco Corp., Salt Lake City, Utah; and Simplot (J. R.) Co., Caldwell, Idaho.
Lloyd M. Grames, and Ray W. Kueneman.
J Water Pollut Contr Federation, Vol 41, No 7, p 1358-1367, July 1969. 2 fig, 3 tab, 2 ref.

Descriptors: *Foods, *Settling, *Design, Wastewater treatment, Cost Analysis.
Identifiers: *Primary treatment, *Snake River (Ida), Cattle feed, Vacuum filter, Population equivalent, Grease removal.

The results are reported of an investigation by an engineering committee which the Idaho Potato Processors Association formed to look into different methods of primary treatment to solve a pollution problem created by the operation of processing plants along the Snake River, Pilot-plant tests developed a primary treatment scheme including an optional grease-removal unit, potato waste clarifier, and belt-type vacuum filter. The authors report that the approach adopted by the potato processing industry in Idaho for the solution of the problem has been highly successful, that a primary treatment system with high efficiency has been produced; and that the facilities have resulted in the removal of waste from the waters of the state of Idaho equivalent to a population of more than three million. Dewatered sludge is sold profitably as cattle feed. (Ledbetter-Texas)
W70-01990

COMPUTATIONAL ANALYSIS OF TRANSIENT RESPONSE TO QUANTITATIVE SHOCK LOADINGS OF HETEROGENEOUS POPULATIONS IN CONTINUOUS CULTURE,
Oklahoma State Univ., Stillwater. Bioengineering Labs.
F. F. Storer, and A. F. Gaudy, Jr.
Environ Sci Technol, Vol 3, No 2, p 143-149, Feb 1969. 5 fig, 17 ref.

Descriptors: *Activated sludge, *Model studies, *Mathematical models, Carbon, Nutrients, Growth rates, Biological treatment.
Identifiers: *Shock loadings, *Chemostat, Glucose, Carbon source, Monod equation, Substrate, Cell yield, Continuous cultures, Heterogeneous populations, Heterogeneous cultures.

The Monod equation does not accurately predict the transient state biological solids and substrate concentrations subsequent to an increase in inflowing waste concentration. A chemostat was seeded from the primary clarifier of a sewage treatment plant and operated with synthetic medium. Carbon was furnished by glucose and was the growthlimiting nutrient. Shock loadings up to threefold were employed in six runs. The cell yield was calculated as the ration of the instantaneous rate of production of biological solids to the rate of COD utilization rather than the steady state procedure. A hysteresis was noted in the actual plot and the plot from the Monod equation. Future studies could well use a dual approach to mathematical analysis of biological growth of a heterogeneous population of microorganisms in aerobic conditions of transitional loadings. (Ledbetter-Texas)
W70-01991

CORROSION-RESISTANT COATINGS FOR WASTEWATER TREATMENT PLANTS,
Koppers Co., Inc., Pittsburg, Pa. Organic Materials Div.
A. F. Pistor.
Water Wastes Eng, Vol 6, No 5, p 52-53, May 1969. 1 fig, 1 tab.

Descriptors: *Protective coatings, *Paints, *Corrosion control, Epoxy resins, Coal tar coating.
Identifiers: *Corrosion resistance, *Concrete corrosion, Modified alkyds, Epoxy esters, Phenolic resins, Coal tar pitch, Coal tar epoxies, Chlorinated rubber, Vinyls.

Wastewater treatment facilities need to be constructed for corrosion control along with waste stabilization. Many places in waste treatment facilities are conducive to corrosion. Designs and construction can eliminate many of the causes of corrosion but protective coatings are needed on much of the equipment. The protective coating may be applied over a prime coat or the equipment may be sandblasted and coated in the field. The coatings in use include the following: oil modified alkyds, epoxy esters, phenolic resins, epoxy resins, coal tar pitch, coal tar epoxies, chlorinated rubber, and vinyls. The resistance characteristics are classified of these coatings and their application properties are given. (Ledbetter-Texas)

OIL WASTE DISPOSAL FACILITY STUDY, SEATTLE AREA,
Cornell, Howland, Hayes and Merryfield, Seattle, Wash.
William J. Edwards, and Norman C. Ward.
Municipality, Metropolitan Seattle, Engineering Report, Aug 1969. 51 p, 9 fig, 5 tab, 57 ref.

Descriptors: *Oil wastes, *Reclamation, *Treatment facilities, *Water pollution, *Water pollution control, *oily water, Oil, Pollution abatement, Sludge, Settling basins, Landfills, Sludge disposal, Costs, Incineration, Administration, Finance, Separation techniques, Design.
Identifiers: *Seattle, *Illegal dumping, Reuse, Barging wastes, Enforcement.

The engineering report presents the scope of the oil waste disposal problem, solutions thereto, dangers of contamination of underground and surface waters and details of design, operation, administration and finance of a recommended treatment facility for oil wastes. The study, financed by four public agencies in the Seattle area including the State, was initiated as the result of an illegal discharge of oil, in 1967, into the sewer system of the municipality of metropolitan Seattle. Oil wastes generated annually in the Greater Seattle area (Tacoma to Everett) total 9.3 million gallons. Principal sources are automotive, ship and tank cleaning, and industrial. Reclamation and reuse of the oil wastes, when feasible, is cited as the most desirable procedure to prevent pollution. Limitations of current disposal procedure are discussed--including landfilling, barging to sea, incineration and subsurface injection. The basic recommendation is that a local public agency construct and operate a central facility for disposing of oil wastes brought there by anyone. Total annual cost of the facility was estimated to be $105,000. A charge of 3.5 cents per gallon of wastes received is recommended to make the plant self-supporting. The suggested facility, when completed, would be unique. Federal demonstration grant funds are mentioned. Drawings, tables and bibliography are included. (Poertner-Chicago)
W70-02030

MULTISTAGE BIOLOGICAL PROCESSES FOR WASTE TREATMENT,
Deering Milliken Research Corp., Spartansburg, S.C.; and Clemson Univ., S.C., Dept. of Environmental Systems Engineering.
Eugene P. Willimon, Jr., and John F. Andrews.
J Water Pollut Contr Federation, Vol 41, No 1, p 99-112, Jan 1969. 12 fig, 1 tab, 18 ref.

Descriptors: *Anaerobic conditions, *Fermentation, *Anaerobic digestion, Septic tanks, Pilot plants, Microorganisms, Chemical oxygen demand, Phenols.
Identifiers: *Contact stabilization, pH, Volatile suspended solids, Multi-stage treatment, Continuous systems, Biomass, Coke oven wastes, Thiocyanates.

Use of multi-stage systems is examined in biological processes for anaerobic digestion. Exploratory studies on a two-stage anaerobic process involving pH control and limited aeration in the first stage are

presented. Improved chemical oxygen demand reductions were obtained using the two-stage process. The effects of pH, limited aeration, and retention time on product distribution are described. (Ledbetter-Texas)

5E. Ultimate Disposal of Wastes

SLUDGE DISPOSAL AND THE MARINE ENVIRONMENT,
Municipality of Metropolitan Seattle, Wash.
Ralph S. Domenowske, and Robert I. Matsuda.
J Water Pollut Contr Federation, Vol 41, No 9, p 1613-1624, September 1969, 12 p, 10 fig, 6 tab, 18 ref.

Descriptors: *Sludge disposal, *Marine bacteria, *Water quality control, *Waste treatment, *Benthos, Optimization, Biological properties, Biochemical oxygen demand, Computers, Regression analysis, Bacteria.

The study was conducted by the Municipality of Metropolitan Seattle to determine the minimum treatment and disposal costs required to meet the most stringent water quality standards of puget sound. The study also evaluated the biological and physical changes in the water and benthos which might have been the result of effluent or sludge disposal from the West Point treatment plant. Extensive tests and model studies were conducted prior to the construction of the outfall and predictions were made regarding the functionings of the system. One-way analysis of variance tests between station depth and outfall proximity for seven groups of benthic organisms were made. The analysis of variance, linear regression and computer plots of the chemical oxygen demand and bacterological and primary productivity data were collected and used in the biological analysis. Chemical oxygen demand values showed no significant difference in different strata. The bacteria count had decreased since the West Point Plant had gone into operation. (Thiuri-Cornell)

INCINERATION OF GRIT, SCREENINGS, AND SCUM.
Havens and Emerson, Cleveland, Ohio.

Report, Metropolitan Sanitary District, Greater Chicago, Feb 1969. 77 p, 11 tab, 6 fig, 2 append.

Descriptors: *Scum, *Sediments, *Sewage disposal, *Solid wastes, *Waste identification, *Wastewater disposal, *Incineration, Waste disposal, Wastes, Disposal, Costs, Air pollution, Heat balance, Sanitary engineering.
Identifiers: *Grit, *Sewage screenings, *Chicago, Sanitary district, Waste heat recovery, Material handling, Wastewater treatment and plant design.

Detailed studies and a preliminary design of an incineration system for the disposal of grit, screenings, and scum from all of the wastewater treatment plants of the Metropolitan Sanitary District of Greater Chicago are reported by a firm of consulting engineers. The study included: (1) determination of quantities and characteristics of the waste materials; (2) material handling problems; (3) incineration processes; and (4) design, layout, and cost estimates of the proposed system. The report proposes the construction of an incinerator at the District's Southwest Treatment Works capable of handling 250 tons (wet) daily. Containerized truck hauling of grit, screenings, and scum from outlying District treatment plants to the Southwest plant is recommended, based upon cost comparisons with other methods. An incinerator proposed is a 7-hearth furnace designed to meet anticipated air pollution regulations and estimated load requirements in the year 1985. A waste-heat recovery system is considered feasible and is recommended (optional) for space heating, material thawing, and for use in the plant's power house. Construction costs (1970) are estimated at $2,631,000, and annual operating and maintenance costs, $138,600. (Poertner-Chicago)

DISPOSAL OF DIGESTED SLUDGE TO PUGET SOUND--THE ENGINEERING AND WATER QUALITY ASPECTS/July, 1965.
Municipality of Metropolitan Seattle, Wash.

Municipality of Metropolitan Seattle, King County, Washington, July 1965. 75 p, 9 photos, 36 fig, 21 tab, 177 ref, 6 append.

Descriptors: *Sewage sludge disposal, *Sludge disposal, *Sewage disposal, *Oceanography, Sludge treatment, Water quality control, Anaerobic digestion, Monitoring, Costs, Beds under water, Sludge worms, Waste disposal, Chlorination, Hydarulic conduits, Hydraulic design.
Identifiers: *Puget Sound, *Seattle, Municipality of Metropolitan Seattle, Dilution of sludge, Submarine sludge outfall sewer, Ocean disposal of sewage sludge, Outfall diffuser.

The disposal of digested sludge from the West Point and Renton wastewater treatment plants serving Metropolitan Seattle by dilution in the waters of Puget Sound is recommended. The Municipality's staff and consultants agree that the quality of the receiving water can be suitably maintained for other beneficial uses and that the public health and welfare will be protected. A comprehensive water quality monitoring program is being established. The digested sludge would be screened to remove objectionable floatable materials, mixed with effluent from the primary treatment plant, and chlorinated prior to disposal into the Sound through a 96 inch diameter submerged outfall sewer. Jet mixing with sea water by a diffuser in the sewer will produce a dilution of more than 10,000 to one upon discharge. Ultimate disappearance of the sludge will result from combined effects of further volatization, hydrodynamic dispersion, sedimentation and flushing to the ocean. Little buildup of digested sludge solids on the bottom of the Sound is predicted. The sludge disposal method proposed is believed to be the most practical and economical of various alternatives considered. Similar sludge disposal methods are practiced successfully at Los Angeles. (Poertner-Chicago)

5F. Water Treatment and Quality Alteration

PESTICIDES IN DRINKING WATER: WATERS FROM THE MISSISSIPPI AND MISSOURI RIVERS,
Consumer Protection and Environmental Health Service, Cincinnati, Ohio.
M. L. Schafer, J. T. Peeler, W. S. Gardner, and J. E. Campbell.
Environ Sci and Technol, Vol 3, No 12, p 1261-1269, Dec 1969. 9 p, 1 fig, 8 tab, 6 ref.

Descriptors: *Pesticide residues, *Potable water, *Mississippi River, *Missouri River, DDT, Dieldrin, Endrin, Aldrin, Heptachlor, Water pollution sources, Sampling, Municipal water, Water supply, Water analysis.
Identifiers: Drinking water, DDE, HCE.

Over 500 grab samples of finished drinking water and related raw water were assayed for 10 organochlorine pesticides, their metabolites, and related compounds. The samples were collected between March 1964 and June 1967 from 10 selected municipal finished water supplies whose source was either the Mississippi or the Missouri River. Both 100-ml and 1-gallon sample sizes were assayed. Included is a statistical evaluation of the one-step extraction method using 1-gallon samples to which known amounts of the 14 compounds were added to levels ranging from 0.06 to 5.0 ppb. Over 40% of the finished water samples contained detectable dieldrin and more than 30% contained detectable endrin, DDT, and DDE. Twenty per cent of the 63 samples assayed for chlordan contained detectable concentrations; five of these were in excess of 0.25 ppb. Aldrin, HCE, and heptachlor were found only occasionally. No toxaphene nor methoxychlor was detected. (Knapp-USGS)

SURVIVAL OF ADULT DREISSENA IN COPPER SULFATE SOLUTIONS OF DIFFERENT CONCENTRATION AND TEMPERATURE,
Akademiya Nauk URSR. Inst. of Biology of the Southern Seas.
V. S. Lukanin.
Translated from Trudy Instituta Biologii Vnutrennikh Vod, No 7 (10), 1964. Biology and Control of Dreissena, Jerusalem, Israel Program for Scientific Translations, 1968, p 69-70.

Descriptors: *Copper sulfate, *Molluscasides, Mollusks, Water supply.
Identifiers: *Dreissena.

Lethal doses of copper sulfate for adult Dreissena with 5 hours exposure were experimentally determined at 11 concentrations ranging from 0.0 mg/l to 24,300 mg/l and at 5 temperatures ranging from 12.5 deg C to 32.5 deg C. At temperatures below 22.5 deg C the lethal doses of copper sulfate are unpractically high. Exposure to 32.5 deg C for 5 hours in pure water resulted in 100% mortality. (Tyner-Washington)
W70-01791

THE EFFECT OF CERTAIN METAL IONS ON DREISSENA,
Akademiya Nauk SSSR, Moscow. Institut Biologii Vnutrennykh Vod.
V. F. Dudnikov, and V. P. Mikheev.
Translated from Trudy Instituta Biologii Vnutrennikh Vod, No 7 (10), 1964. Biology and Control of Dreissena, Jerusalem, Israel Program for Scientific Translations, 1968, p 60-64.

Descriptors: *Electrolysis, *Molluscasides, Ions, Mollusks, Pesticides, Pipelines.
Identifiers: *Dreissena, *Copper ions, *Silver ions, Lead ions, Mercury ions, Zinc ions.

One method for the elimination of Dreissena overgrowth in pipelines is the use of electrolytically dissolved metal ions. Silver, copper, mercury, zinc and lead were tested for their molluscasidal effect. Copper is the most effective (100% mortality in 24 hours at 4 mg/l). Larger mollusks die sooner than small ones. Dreissena perish sooner at water temperature optimal for their development. (Tyner-Washington)

AERATION OF WAHNBACH RESERVOIR WITHOUT CHANGING THE TEMPERATURE PROFILE,
Wahnbachtalsperenverband, Siegburg (West Germany).
Heinz Bernhardt.
J Amer Water Works Ass, 5918, p 943-64, 1967.

Descriptors: *Temperature, *Thermal stratification, *Aeration, Manganese, Reservoirs, Impoundments, Stability, Hypolimnion, Fish, Plankton, Oxygenation, Economic efficiency, Phosphorus.
Identifiers: Artificial aeration.

Aeration and mixing of a 33,740 acre impoundment was found to be technically and economically feasible either by destratification by using the diffused air bubble method or by aeration of the hypolimnion only. Cold water for drinking was preserved by hypolimnion aeration inasmuch as destratification did not occur. O2 was maintained>0 in the hypolimnion and Mn++ concentrations were near 0. Mixing reduced the population of the algae Oscillatoria rubescens. The influence of destratification on the movement of phosphorus to the surface of the reservoir could not be determined, but eutrophic processes were not increased as no additional plankton occurred in the reservoir after mixing. The oxygen transfer, oxygenation capacity, and destratification efficiency of the devices described in this paper compare favorably with other aeration devices reported in the literature. COMBINED UNDERFLOW-STORAGE PLAN FOR POLLUTION AND FLOOD CONTROL IN THE CHICAGO METROPOLITAN AREA.
Department of Public Works, Chicago, Ill. Bureau of Engineering.

City of Chicago Dep Public Works, Bur Eng Rep, Sept 1969. 43 p, 13 exhibit, 6 tab.

Descriptors: *Storm runoff, *Waste water treatment, *Water pollution control, *Tunnels, *Illinois, Urbanization, Sewers, Sewage treatment, Drainage systems, Storm drains.
Identifiers: Combined sewer systems, Chicago Underflow-Storage Plan.

The basic concept of the Chicago Underflow-Storage Plan for Pollution and Flood Control is the use of a pattern of underground tunnels, sized so as to provide a rational and economical fusion and linear distribution of storage volume and conveyance capacity in a single pattern of cleansable tunnels, without the necessity for supplemental storage in caverns or quarries, without power development. All water remaining in the underground tunnels after each storm period will be pumped directly to the existing treatment works. The underflow-conveyance capacity takes advantage of the lowered water levels to be established in the Illinois Waterway at Lockport for flood control and improved navigation. The basic features of the Underflow-Storage Plan include: (1) 18,000 acre-feet of underground storage; (2) A combined outflow capacity by underflow and overflow of about 43,000 cfs; (3) Sufficient underground storage for any storm having a frequency of recurrence up to 100 years. The total capital cost of the proposed Combined Underflow-Storage Plan is estimated to be $650,000,000. (Knapp-USGS)

HOW TO BEAT THE HEAT IN COOLING WATER,
Sargent and Lundy, Chicago, Ill.
T. D. Kolflat.
Electrical World, Vol 170, No 16, p 31-33, Oct 14, 1968. 6 fig.

Descriptors: *Temperature, *Cooling towers, Cost comparisons, Reservoirs, Thermal pollution, Water cooling.
Identifiers: Spray-header cooling.

One method proposed for holding down the heating effect is to dissipate it to a greater volume of water. For example the heat discharged from a 1000 Mw plant will add 30F to a 1000 cfs flow, 3F to 10,000 cfs flow and 0.3F to 100,000 cfs. Another approach is to select the optimum condenser rise independent of dilution considerations and dilute the water after it leaves the condenser. In many areas the natural rolling topography lends itself to building reservoirs for cooling water which can provide recreational benefits also. A cooling tower attempts to accelerate the natural cooling process. Cooling-tower performance is a function of range and approach. In general, the mechanical-draft wet-type tower will have an optimum range of 21F and an approach of 18F, the natural-draft wet-type a range of 26F and an approach of 18F, the mechanical dry-type a range of 12F and an approach of 33F and natural-draft dry-type a range of 17F and an approach of 38F. COOLING-WATER DEBATE NEEDS CLARIFICATION,
Sargent and Lundy, Chicago, Ill.
T. D. Kolflat.
Electrical World, Vol 170, No 8, p 25-27, Aug 19, 1968. 6 fig.

Descriptors: *Temperature, *Thermal pollution, Fish, Thermal power.

The quantity of heat added to the cooling tower is essentially equal to that exhausted from the turbine. This exhaust heat can be reduced by modifying the basic thermal cycle. Each 100-psi increase in pressure of steam entering the turbine will decrease waste heat 0.4%. If the steam generated in the boiler is passed through a superheater the heat rejection will be reduced by about 1.4% for each 50F added. Another method of reducing heat from the turbine exhaust is to extract a portion of the steam from various points in the turbine and use it to heat water entering the boiler. This can reduce heat rejection up to 37%. There seems to be sufficient evidence to seriously question 93F as a water limit. Many plants have discharged water to rivers at 105F in summer with no adverse effect on aquatic life; fish have been caught alive in 105F water. Fish acclimatize to higher temperatures and migrate to and from areas not to their liking. Tolerance levels vary with different species and dissolved oxygen is above the minimum for fish at temperatures as high as 105 deg F. (Upadhyaya-Vanderbilt)

Water Research, Vol 2, p 737-752, Nov 1968. 12 fig, 20 ref.

Descriptors: *Stratified flow, *Sewage disposal, *Jets, Density stratification, Tracers, Design criteria.
Identifiers: *Stratified dispersion, Bacterial decay.

Results from several tracer experiments with submerged sewage fields in long-shore currents having pronounced stratification are used as a basis for the economical optimization of a discharge of domestic sewage through a diffuser. Existing theories on jet diffusion have been modified to fit the observed conditions, which have almost arbitrarily varying density distributions. A first approximation to dispersion in stratified flow is applied with data derived from tracer experiments. Bacterial decay is disregarded due to the very slow decay rates previously observed in The Sound, which is the strait between Denmark and Sweden. The computation of jet diffusion and stratified dispersion is computerized to meet the demand for a statistical prediction of pollution and for selecting the most economical design among the infinite number of possible outfall designs. Density effects on the sewage field are suggested to be of significance to design criteria for diffusers. (Rietveld-Vanderbilt)

AQUATIC WEED CONTROL WITH SODIUM ARSENITE,
Wisconsin State Board of Health, Madison. Committee on Water Pollution.
Kenneth M. Mackenthun.
Sewage and Industrial Wastes, Vol 22, No 8, p 1062-1067, Aug 1950. 20 ref.

Descriptors: *Aquatic weed control, *Sodium arsenite, Fish, Wisconsin, Lakes, Shores, Pondweeds, Chara, Copper sulfate, Bass, Eutrophication, Water pollution effects, Water pollution control, Water quality control, Herbicides.
Identifiers: Arrowhead, Water plantain, Bladderwort, Coontail, Waterweed, Wild cherry, Water crowfoot, Water milfoil, Bluegills, Crappies, Common pondweed, Bushy pondweed, Chemical weed control, Wisconsin Committee on Water Pollution, Horned pondweed.

Commercial sodium arsenite has been effectively used in the destruction of certain species of aquatic vegetation and the eradication of localized nuisances without harm to fish life. In Wisconsin its use has been authorized and supervised by an interdepartmental state committee for the past 10 years. Dosages up to 10 parts per million are recommended, depending on the physical character of the area to be treated. The time necessary for weed destruction after application of the chemical is usually about seven days. Treatment should be initiated when weeds are young and growing vigorously, so that a maximum amount of chemical will be absorbed by plant cells. Following destruction, weeds sink to the bottom and remain in place in the bottom muds. This procedure reduces the possibility of oxygen depletion caused by the decomposition of large masses of plant tissue. Decomposition rates are usually so slow that the oxygen balance is not greatly distorted. A history of the development of the program in Wisconsin is given in detail, as well as the method of application and the effect of such application on aquatic vegetation and aquatic organisms. WATER POLLUTION CONTROL.

R I Gen Laws Ann secs 46-12-2, 46-12-3 (Supp 1968).

Descriptors: *Rhode Island, *Water pollution control, *Public health, *Pollution abatement, Abatement, Water pollution effects, Disposal, Environmental engineering, Legislation, Legal aspects, Wastes, Pollutants, Water polution sources, Water pollution treatment, Project planning, Planning, Surveys, Investigations, Administrative agencies, Federal government, Water quality, Supervisory control (Power).

The Director of the Department of Health is responsible for carrying out the state's water pollution control legislation. He may consult the Advisory Board of Water Pollution regarding policies and plans for control and abatement of pollution. The Department of Health is designated as the state's water pollution control agency for purposes of obtaining federal assistance under the federal Water Pollution Control Act. In addition to exercising general supervisions of the administration of the pollution law, the Director shall: (1) develop programs for prevention and abatement of new and existing pollution; (2) cooperated with federal and state agencies in planning or securing financial assistance; (3) conduct investigations and disseminate information concerning water pollution and its control and prevention; (4) modify or adopt standards of water quality; (5) administer state grants to political subdivisions for construction of sewer treatment works; (6) supervise construction of disposal systems; and (7) issue reasonable rules and regulations for the prevention, control, and abatement of pollution and enforcement of orders thereunder. WATER QUALITY MANAGEMENT BY REGIONAL AUTHORITIES IN THE RUHR AREA,
Resources for the Future, Inc., Washington, D.C.
Allen V. Kneese.
Controlling Pollution, Englewood Cliffs, N J, Prentice Hall, p 109-129, 1967. 21 p.

Descriptors: *Water quality management, *Water pollution, Economics, Regional analysis, Municipal wastes, Industrial wastes, Government, Watersheds, Rivers, Planning, Costs, Waste treatment, Taxes, Welfare economics, Effluents, Marginal costs, Prices, Flood control, Water supply, Water resources.
Identifiers: *Ruhr River, Social costs.

In this article the author describes how pollution has been successfully checked by a method which combines regional cooperation and management with a system of economic charges to polluters. A review of the background and concepts underlying water quality management in the United States is provided with the conclusion that achieving clean streams will involve public investment far higher than in any other field of resources development or conservation. This provides the framework for discussion of the German experience. The cost assessment procedures and effluent charges are outlined. Generally, it is found that economic incentives have been used successfully to control the pollution of manufactures and municipalities. The article concludes, however, with a discussion of some of the difficulties and deficiencies in this method of pollution control. (Murphy-Rutgers)

EFFLUENTS AND AFFLUENCE,
Federal Reserve Bank of Boston, Mass.
Jared E. Hazelton.
New England Business Review, p 2-9, June 1965. 8 p.

Descriptors: *Regional analysis, *Water pollution, Rivers, Streams, Costs, Benefits, Waste disposal, Water resources development, Municipal wastes, Industrial wastes, Recreation, State government, Federal government, Flood control, Planning.
Identifiers: *Zoning, *Classification of rivers, Scenic value.

This article describes the zoning approach used by the New England Interstate Water Pollution Control Compact. This regional authority classifies sections of rivers and streams according to a scale of potential water uses, balancing the costs of treatment and dumping restrictions against the benefits that various kinds of water use bring to the community. An attempt is made to estimate the progress in water pollution control through the increased number of treatment plants constructed. The role of the federal and state governments is reviewed. The article concludes with some recommendations for necessary changes in the area. (Murphy-Rutgers)

A MODEL FOR QUANTIFYING FLOW AUGMENTATION BENEFITS,
Florida Univ., Gainesville. Dept. of Environmental Engineering.
E. E. Pyatt, J. P. Heaney, G. R. Grantham, and B. J. Carter.
Available from the Clearinghouse as PB-188 208 $3.00 in paper copy, 0.65 in microfiche. Final Report to Federal Water Pollution Control Administration, USDI, Southeast Region, Atlanta, Ga, Sep 1969. 630 p, 52 tab, 58 fig, 184 ref, 5 append. FWPCA Grant No 16090 DRM.

Descriptors: *Systems analysis, *Benefit - cost analysis, *Flow augmentation, Water quality control, River basins, Reservoirs and impoundments.

With increasing quantitative and qualitative demands being placed upon national water resources, improved management practices are vitally needed. In principle, one powerful management tool is systems analysis, wherein mathematical optimizing techniques are employed to effect rational tradeoffs between competing demands for water use, but this tool, in turn, rests upon the availability of methodologies for quantifying the benefits (economic value) of each water-use category. That is, systems analysis, before it can be employed comprehensively, demands a knowledge of the functional value of irrigation, flood control, municipal water supply, etc. Little is known of the economic implications of low flow augmentation, one of the important water-use categories. Beginning with the premise that the value of low flow augmentation is measured by sewage treatment costs avoided, a hydrologic flow simulator and a water quality linear programming model were interfaced to develop a procedure for determining 'willingness to pay' for augmentation. This generalized approach can be applied by others to their specific water pollution control situations.

CRITICAL PATH METHOD OF WORK SCHEDULING,
Department of Water and Power, Los Angeles, Calif.
Robert U. Olson.
J Amer Water Works Ass, Vol 61, No. 9, p 447-454, September 1969. 8 p, 12 fig, 2 ref.

Descriptors: *Critical path method, *Scheduling, *Resource allocation, *Network design, *Simulation, Computers, Project allocation, Control systems construction costs, Construction materials.
Identifiers: Early start time, Late start time.

The step-by-step procedure for the development of a critical path method (CPM) was given. The objective of the study was to demonstrate by a construction project example the step-by-step organization and use of the critical path method of scheduling. Thirteen steps were outlined. The steps ranged from the listing of all activities that were required to be performed for the completion of the project to maintaining project control by instituting a regular reporting system. The early start time (EST) and the late start time (LST) were calculated and a critical path determined. The critical path was the longest time path through the network, and was indicative of the time it would take to complete the job. The critical path had two main characteristics, (a) it passed through all events were EST and LST were the same, (b) it was continuous from the start of the project to the end. The use of a computer to simulate CPM network diagrams was recommended. It was concluded that CPM would indicate the most practical way accelerate completion of the project, and in the scheduling of material delivery, provide information on the effects of changes and allow for a more effective utilization of resources. (Thiuri-Cornell)

PAPER (TRANSPORT CAPACITY OF A NAVIGABLE WATERWAY) (IN FRENCH),
Antoni Arkuszewski, and Todeusz Wierzbicki.
In: Perma Int Asso of Navigation Congr, XXIInd Int Navigation Congr, Paper Sect 1, Subj 4, p 117-127, 1969. 11 p, 2 tab.

Descriptors: *Navigable rivers, Concrete-lined canals, Optimum development plans, *Inland waterways.
Identifiers: *Traffic capacity, Canalized rivers.

Particular sectors of waterways in Poland have various gauges, which influence the traffic capacity. The free-flowing rivers have large traffic capacities. The capacity of locks are not as great and depends on the speed of opening and closing, and of filling and emptying of locks. Also, the speed of ships coming in and going out of the locks is an important factor. For each waterway the optimum size of ships which allow for the maximum capacity of the waterway may be determined. An example of the optimization of traffic capacity of the Odra is included. In order to increase the traffic capacity of waterways the following conclusions are suggested: unify the gauges of channels and its conditions of navigation; unify the size of ships, as far as possible; the locks should be equipped with protective installations, the locks should be well lighted for day and night use; the capacity of ports should be greater than the capacity of waterways. The article is written in French and includes an English summary. (Grossman-Rutgers)

DEVELOPMENT PROBLEMS IN ARID ZONES,
Raymond Furon.
IN The Problem of Water: A World Study, New York American Elsevier, p 135-162, 1967.

Descriptors: *Arid lands, *Land reclamation, *Arable land, *Climatology, *Semiarid climates, Irrigable land, Dendrochronology, Human resources, Land resources, Water resources, Economics, Deserts, Population, Permafrost.
Identifiers: *Israel, *Greece, *Algeria, *Sahara, Egypt, Nile River, Fossil water.

Arid lands of the world might be brought under cultivation to meet the need for food by an expanding world population. Large uncultivated areas of the world are listed. Much of these regions is unsuitable mountain country, frozen waste or true desert without accessible water. Many semiarid lands have once been cultivated and might be again if economically sound means were devised to deliver irrigation water. Over the long run reclamation plans should consider dependability of water supply in view of long term weather cycles. The author identifies 'false deserts' as areas with a dependable source of water which have become unproductive through neglect or misuse and resulting erosion. Greece and Israel are examples that are being reclaimed through careful planning and management. The author emphasizes and gives examples of the need for careful planning, thorough physical and human resource surveys and sound management in successful arid land reclamation. (Crouse-Arizona)

THE GEOGRAPHICAL BACKGROUND OF THE JORDAN WATER DISPUTE,
Moshe Brawer.
In: C A Fisher, ed, Essays in Political Geography, 1968, London, Methuen, p 225-242. 2 maps, 10 ref.

Descriptors: *Arid lands, *Irrigation programs, *Pumping, *Water resources development, *Political aspects, Water quality, Chlorine, Costs, Rivers, Water shortage, Institutional constraints, Foreign countries.
Identifiers: *Israel, *Jordan River, *Jordan, Sea of Galilee, Syria, Political Geography.

The author reviews the geographical and historical background of the Jordan water dispute. Well over half of Israel has an average rainfall of less than 8 inches. Israel has already developed virtually all of the fresh water resources under its control. If further agricultural and economic growth is to proceed, Israel must draw on large quantities of Jordan River water. Such development is disputed by the Kingdom of Jordan and by Syria, through which the head waters of the Jordan run. Syria has successfully blocked the originally planned diversion project for Jacob's Daughter's Bridge, from which water would have flowed by gravity to the western deserts of Israel. Instead, water is lifted by costly pumping from the Sea of Galilee, which is within Israel's geographic boundaries. Substantial savings in evaporative losses are realized, however. Far more efficient use of the Jordan's waters could be affected by cooperative development by all the nations concerned rather than by individual national development schemes. (Crouse-Arizona)

REGIONAL CONSIDERATION OF FLOOD PLAIN PLANNING,
Bi-State Metropolitan Planning Commission for Scott County, Iowa and Rock Island County, Ill.
William S. Luhman.
In: Flood Plain Management, Iowa's Experience, Iowa State University Press, Ames, Iowa, p 93-102, 1969. 1 fig, 10 ref.

Descriptors: *Planning, *Coordination, *Regions, Flood plains, Regional analysis, Local governments, Management, Iowa, Land use.
Identifiers: Scott County, Iowa, Bi-State Metropolitan Planning Commission.

This article focuses on the development of effective regional planning programs which relate to flood plain management. The existing pluralistic local government system cannot deal effectively with regional problems. Therefore, there is a need for some sort of regional cooperative planning for the continued growth and development of these urban regions. The Federal government has recognized this problem and several acts have been passed requiring regional coordination in application for grants. Local elected officials are also giving recognition to the necessity of individual local governments joining together in solving their related and frequently interdependent urban problems. Identification of goals and objectives, the need for cooperative regional planning, the preparation of a regional land-use plan and problems of effectuating a regional plan are discussed. A specific example of the Bi-State Metropolitan Planning Area in Scott County, Iowa and Rock Island, Illinois, is used to illustrate problems of coordination in regional planning. The conclusion reached is that it is futile to attempt regional planning without similar programs in operation along the length of the river, based upon a total river basin program. The real contribution the regional approach makes is to begin coordinating the many local jurisdictions within each of the respective regions along the river. (Marriott-Chicago)

TECHNIQUES FOR DEVELOPING A COMPREHENSIVE PROGRAM FOR FLOOD PLAIN MANAGEMENT,
Iowa State Univ., Ames.
Merwin D. Dougal.
In: Flood Plain Management: Iowa's Experience (Iowa State University Press, Ames, Iowa 1969), p 53-75. 7 fig, 32 ref.

Descriptors: *Flood control, *Water management (Applied), Flood forecasting, Flood damage, Flood protection, Water control, Iowa.
Identifiers: *Flood plain management.

The steps required to implement an action program for a flood plain management program are outlined. An action program provides for recognition of the flood hazard, flood forecasting, flood fighting emergency measures, short-range plans for alleviating flood damages, and long-range plans to accomplish the wise use of flood plain areas. The indirect and direct methods of reducing flood damages through control of floodwaters are reviewed in some detail. Flood forecasting and warning systems can be implemented swiftly at little cost to the community. Flood fighting and emergency protection measures can assist in reducing flood losses. Engineering works for flood control provide additional measures for direct and effective control of flood water and permit substantial reductions of flood losses where they are economically feasible. In conclusion, the author states that although the implications for funding, organization, and personnel appear great if all these endeavors are to be accomplished in a modicum of time, existing agencies can be used at the federal level and in most states. A reorientation or strengthening of activities is a major requirement at several levels of government, but mainly at the state and local levels. Each of these measures should be considered a part of the total flood plain management program for a river basin or for acceptance by a state government. (Marriott-Chicago)
W70-01838

MAN SHOULD MANAGE THE FLOOD PLAINS,
James E. Goddard.
In: Flood Plain Management: Iowa's Experience, ed by Merwin D Dougal (Iowa State University Press, 1969), p 11-21. 7 ref.

Descriptors: *Flood plains, *Management, Political aspects, Adoption of practices, Flood control, Flood plain zoning, Multiple-purpose projects.
Identifiers: *Flood plain management.

The article includes basic discussion of the meaning of flood plain management, a review of the historic role of flood plain utilization and attendant flood damages, and enlarges upon the need for comprehensive and broad approaches to management. Broader programs now being developed are discussed and it is pointed out that success in flood plain management depends upon cooperation between all agencies and levels of government. Recommendations for more effective action given in some detail are briefly: (1) Improve public relation and programs for informing the public so there will be necessary support for action programs; (2) arrange state conferences directed toward developing better understanding of the respective federal, state, and local roles and of their relationship in flood plain management; (3) accelerate the effort of the federal government; (4) enlarge the roles of the states and encourage term to accept greater responsibility in programs to assist their citizens; and (5) increase the role of local governments (city, county, and regional) and their acceptance of greater responsibility. (Marriott-Chicago)

METROPOLITAN WATER RESOURCE MANAGEMENT AS AN EMERGING SPECIALIZED TECHNICAL AREA: A STATE-OF-THE-ART AND LITERATURE REVIEW,
Chicago Univ., Ill. Center for Urban Studies.
John R. Sheaffer, Shirley A. Starr, George Davis, and Alan Richmond.
Available from the Center for Urban Studies, University of Chicago, for $3.00 per copy. Center for Urban Studies, University of Chicago, 1969. OWRR Project W-107. 124 p, 4 fig, 7 tab, 5 append, 1 plate.

Descriptors: *Water resources development, *Project planning, Research and development, Regional analysis, Decision making, Federal project policy.
Identifiers: *Metropolitan water resource management, *Regional integration.

The primary objective of this study is to increase understanding of the present status of the rapidly evolving and potentially beneficial metropolitan water resource management strategy. Through a selective literature search and analysis of materials being produced on metropolitan water resource management, and through a systematic analysis and comparison of theoretical statements and statements made by urban water managers, an interest area has been delineated. The results of this study identify the progress that has been made and the agreement which has been reached. Identified also are the critical research needs and the deficiencies which exist in present metropolitan water resource management efforts.

PAPER: (NAVIGABLE WATERWAYS BANK PROTECTION) (in French),
Behorde fuer Wirtschaft und Verkehr, Hamburg (West Germany).
Kurt Feuerhake, Rudolf Hintze, Werner Hoffmann, Heinrich Meyer, and Hand Theodor Schroder.
In: Perma Int Asso of Navigation Congr, XXIInd Int Navigation Congr Paper, Sect 1, Sub. 6, Inland Navigation, p 5-36, Paris, 1969. 29 fig.

Descriptors: *Retaining walls, *Canal design, Navigable waters, Transportation, *Inland waterways.
Identifiers: *Main-Danube canal, *North Sea-Baltic Sea canal.

The importance of stresses due to traffic on the behavior of bank revetments is stressed. It is necessary to ascertain the forces to which these structures are submitted through full-scale and laboratory tests. The Main-Danube canal in the Bamberg reach was selected for testing inland navigation. For the testing of ocean navigation the North Sea-Baltic Sea Canal was chosen. The bank revetment must be designed to safely absorb the energy developed furing the passage of vessels. The design and the choice of the revetment also depends on materials available and their cost, on conditions of construction on estimated duration of the revetment, and on maintenance costs. The paper is written in French and contains a summary written in English. (Grossman-Rutgers).

Buenos Aires Univ. (Argentina).
R. A. Frederico Prestein.
In: Perma Int Asso of Navigation Congr, XXIInd Int Navigation Congr, Paper Sect 1, Subj 4, p 21-34, 1969. 14 p, 5 maps.

Descriptors: *Navigable rivers, *River systems, Mississippi River, Maintenance costs, Investment, *Inland waterways.

The problems of developing and operating waterways in a country which is itself undergoing development, are set out. A general account of the economy of waterway transport is made. The navigable waterways of Argentina are the Plata, Parana, Paraguay and Uruguay. The size of the river fleet is examined. Navigation conditions on the Parana are compared with those on the Mississippi. The numerous river ports should be either abandoned where there is little traffic or should be industrially developed. The author distinguishes between the infrastructure of the waterway itself (channels, navigable passes, signalling) and stationary installations connected with the waterway (river ports, shore terminals, handling and storage equipment); ships and boats using the waterway in question, a difference being made between ocean-going ships and river boats. Increasing the natural depth of rivers means not only investments but also increased maintenance costs. However, increased tonnage may reduce freight charges. The article is written in English and contains a resume written in French. (Grossman-Rutgers)

PAPER: (TRANSPORT CAPACITY OF A NAVIGABLE WATERWAY) (IN FRENCH),
Bundesverkehrsministerium, Bonn (West Germany).
Dr. Gerhard Wiedemann, Burkart Rumelin, Emil Renner, Werner Behle, and Joachim Michael.
In: Perma Int Asso of Navigation Congr XXIInd Int Navigation Congr, Paper Sect 1, Subj 4, Paris, p 5-20, 1969. 16 p, 2 tab, 1 fig, 5 ref.

Descriptors: *Inland waterways, Psychological aspects.
Identifiers: *Transport capacity, *Traffic density.

Influencing factors and a technique for determining the transport capacity of a waterway section without locks are discussed. The traffic flow of a waterway is affected by the human factor, the actions of ship navigators, as well as the dimensions of the ships and the waterway. This human influence can be quantified by distinguishing various categories in the traffic flow which depend on the traffic density. Determination is possible for typical cases of movement, which govern the categories. Relative traffic densities are established for the main movement cases, for a standard ship and a two-lane canal. These densities are used to determine the admissable traffic density for a section and a selected traffic sequence. The equation traffic quantity equals traffic density times speed, gives us the technical operating capacity as a boundary value for the traffic quantity. The traffic capacity can be derived from this equation. The article is written in French and includes a summary written in English. (Grossman-Rutgers)

PAPER: (TRANSPORT CAPACITY OF A NAVIGABLE WATERWAY),
Netherlands Rijkswaterstaat, The Hague.
H. A. Ferguson, H. Engel, and S. I. E. Blok.
In: Perma Int Asso of Navigation Congr, XXIInd Int Navigation Congr, Paper Sec 1, Subj 4, p 97-115, 1969. 18 p, 6 fig.

Descriptors: *Navigable rivers, *Channels, Inland waterways.
Identifiers: *Traffic capacity, Volkerak locks, The Hague.

The navigable waterways in the Netherlands must be able to take the ever-increasing amount of traffic and meet the increase in sea port activities. The capacity of a navigable waterway depends on a large number of parameters. Some of these, such as the principle characteristics of the waterway, its cross-section of discharge, its lay-out and its dominant currents, are easy to determine. Other parameters are difficult to evaluate: the reciprocal action of the waterway on the boats and vice versa, and the action of the boats on one another. Three methods of traffic analysis are distinguished: calculation, study on models, and in site observations. The capacity of a waterway and degree of traffic fluidity are defined and examined. The Volkerak locks are described as to traffic capacity. The article is written in English with the summary and conclusions written in French. (Grossman-Rutgers)
W70-01848

PAPER: (TRANSPORT CAPACITY OF AN ARTIFICIAL WATERWAY) (IN FRENCH),
Navigazione Interna e Trasporti Internazionali, Milan (Italy).
Dr. Ing. Mario Tanci.
In: Perma Int Asso of Navigation Congr, XXIInd Int Navigation Congr, Paper, Sect 1, Subj 4, p 53-76, 1969. 24 p, 3 tab.

Descriptors: *Artificial water courses, Economic impact, *Channels, Inland waterways.
Identifiers: *Transport capacity.

The transport capacity of an artificial waterway depends upon its characteristics ans specifically on: the number of locks, their distribution along the waterway and their output; and the river fleet and its degree of heterogeneity which influences the possibility of regulating the traffic which, in its turn, is in relation with social and economic condition of adjacent regions, and in relation with influential areas and competitive conditions with other means of transportation. The deductive method is used in assessing the transport capacity of an artificial waterway in Italy. An economic prospect of the proposed artificial waterway is that industrial factories can be set up near to distribution and consumer centers. Surveys are made to determine the zones of influence of each river port and to define the consequent industrial localities. The article is written in Italian and contains an English summary. (Grossman-Rutgers)
W70-01849

PAPER: (EVALUATION OF THE TRANSPORT CAPACITY OF A NAVIGABLE WATERWAY) (IN FRENCH),
Michel Rousselin.
In: Perma Int Asso of Navigation Congr, XXIInd Int Navigation Congr, Paper, Sect 1, Subj 4, p 35-52, 1969. 18 p, 1 tab, 1 fig.

Descriptors: *Simulation analysis, *Locks, Canals, Mathematical studies.
Identifiers: *Optimum economic capacity.

This paper is largely concerned with the notion of capacity of a lock or group of locks of a canal or canalized river. Two methods are explained for determining this capacity. The first method, called the classic method, consists of calculating, for a lock, the optimum economic capacity, from the theoretical maximum annual capacity, by applying a number of reduction factors. The second, called the simulation method, determines the optimum economic capacity by utilizing the results of simulation on computers using programs established on the basis of a mathematical model. With this method the laws of arrival of boats and their dimensions, as well as traffic fluctuations, are taken into account less empirically than the classic method. Both methods are discussed thoroughly. The article is written in French and contains an English summary. (Grossman-Rutgers)

ANALYSIS OF SHIPPING TRAFFIC CAPACITY OF NARROW WATERWAYS - ON THE URAGA CHANNEL,
Ministry of Transport (Japan).
Shunsaku Nishida, Nobuo Watanabe, and Hajime Eguchi.
Perma Int Asso of Navigation Congr XXIInd Int Navigation Congr, Paper, Sect 1, Subj 4, p 77-96, 1969. 20 p, 8 fig, 6 tab.

Descriptors: *Systems analysis, *Channels, Open channel flow.

Utilizing traffic forecasts for the bay ports, and assuming the relationship between that traffic and the traffic passing through the channel to be constant, it is possible to ascertain the latter for the forthcoming years. Furthermore, assuming the distribution of traffic between the various categories of ships to be invariable, it is possible to estimate future traffic for each of these categories. A simulation model is used to determine future traffic. Two types of data are used: those relative to the shape, length, width, and navigation rules of the fairway; and those relative to the speed and safety perimeter of ships. Traffic is calculated on a basis of maximum ship density at the peak hour. The simulation model furnishes the admissible volume of traffic. Plans for the development of the channel are examined. The article is written in English and contains a summary written in French. (Grossman-Rutgers)

USES OF SMALL URBAN RIVER VALLEYS,
Johns Hopkins Univ., Baltimore, Md. Dept. of Environmental Engineering Science.
Ira L. Whitman.
Corps of Engineers, Baltimore District, P O Box 1715, Baltimore, Md 21203, Apr 1968. 310 p, 26 tab, 24 fig, 16 photo, 128 ref, 2 append.

Descriptors: *Land use, City planning, Recreation, Parks, Environmental effects, Value.
Identifiers: *Urban river valleys, Land-value enhancement.

Small river valleys and their land uses were studies in Baltimore, Bridgeport, Fort Wayne, Milwaukee, San Antonio and Washington. Valley park areas are considered in relation to valley properties, and the recreation uses best suited to those properties are determined. A method is developed for rating quality of natural environment in urban valleys. A dependency of urban valley environment upon land use was established. Recreation is closely related to physical conditions and properties. Many recreation activities are enhanced by a high degree of natural environment in urban valleys. Valley planning should begin with measures to preserve and maintain existing qualities. Valley development should be judged on its effect upon existing valley environment. Environmental analyses must accompany valley planning. (Grossman-Rutgers)

URBAN REDEVELOPMENT IN INDIANAPOLIS: A BENEFIT-COST ANALYSIS,
Connecticut Univ., Storrs.
Stephen D. Messner.
Journal of Regional Science, Vol 8, No 2, p 149-158, Winter 1968. 10 p, 12 ref.

Descriptors: *Economic impact, *Investment, *Cost-benefit analysis, *Urban renewal, *Government, Resource allocation, Federal government, Costs, Project planning, Financing, Benefits, Value, Programs.
Identifiers: *Slums, Spillover, Social costs, Social benefits, Land value, Redistribution effects, *Redevelopment.

This study considers the validity and effectiveness of benefit-cost analysis, with particular application to selected redevelopment projects in Indianapolis, Indiana. The form of the analysis first developed by Jerome Rothenberg is used to study the benefits of slum clearance in the area. There were three possible benefits studied: (1) internalizing externalities affecting land use; (2) the spillover effects on other properties; and (3) the reduction of certain slum-associated external social costs. The author finds that the application of benefit-cost analysis to urban redevelopment is clearly not yet at the point where projects and alternatives may be ranked with the technical precision found in the area of water resource development. Although not concerned specifically with water resources, this article provides valuable insights into the application of benefit-cost analysis to public investments which should prove useful to the water researcher. (Murphy-Rutgers)

CRITERIA FOR EVALUATING REGIONAL DEVELOPMENT PROGRAMS,
Tennessee Valley Authority, Knoxville.
John V. Krutilla.
American Economic Review, Vol XLV, No 2, p 120-132, May 1955. 13 p.

Descriptors: *Regional analysis, *Investment, Economics, Cost-benefit analysis, Income, Financing, Agriculture, Natural resources, Capital, Demand, Water resource development, Reservoirs, Costs, Supply, Statistics, Benefits.
Identifiers: *Regional development, *TVA, MPC, Regional multiplier.

This paper discusses the nature of the problem of regional development. The author claims that an approach which attempts to evaluate each program activity individually (for its impact on the sector of the economy toward which it is directed) is superior to regional comparisons of relative change in economic indicators. This is due to errors in the latter method as well as the national orientation of many programs. Benefit-cost analysis is found to be useful as an investment criterion rather than an evaluation criteria in the region of the development program. The most fruitful approach is an analysis of the process of development and how regional development programs may influence that process. Both because of its numerous references to the TVA and the significance of regional development programs in the water resources area, this article has relevance to water program evaluation methods. (Murphy-Rutgers)

EXTERNALITIES, WELFARE, AND THE THEORY OF GAMES,
Carnegie Inst. of Tech., Pittsburgh, Pa.; and Yale Univ., New Haven, Conn.
Otto A. Davis, and Andrew Whinston.
The Journal of Political Economy, Vol LXX, No 3, p 241-262, June 1962. 22 p.

Descriptors: *Welfare economics, *Government, Taxes, Optimization, Government supports, Industrial production, Benefits, Costs, Equilibrium, Mathematical studies, Prices, Marginal cost, Economics, Pricing, Profit.
Identifiers: *Externalities, *Welfare maximization, *Separability.

It is usually said that if firms create external economies and diseconomies, the proper role of a welfare-maximizing government is to constrain the behavior of firms by arranging rates of taxes and subsidies in order to equate private with social benefits. The authors establish the conditions under which this policy will work and of those under which it won't. They argue that firms act to eliminate externalities through mergers, that technological externalities can be divided into separable and non-separable and that the classical scheme will work only in the separable cases. If the externality is non-separable, the classical prescription cannot work even at the conceptual level. The authors attempt to circumvent the problems presented by this to policy makers by several alternative policy approaches. Due to the externalities often found in wate resource projects, this article should prove applicable in understanding the theoretical implications of externalities in the water resource area. (Murphy-Rutgers)

PLANNING 1968.
American Society of Planning Officials, Chicago, Ill.

Selected Papers from the ASPO National Planning Conference, San Francisco, May 4-9, 1968. 322 p.

Descriptors: *Planning, *Conservation, Resources, Government, Economics, City planning, Social change, Political aspects, Statistics, Transportation, Education, Regional analysis, State government, Long-term planning, Area redevelopment.
Identifiers: *Economic development, Physical planning standards, Urban design.

This is a collection of papers presented at the American Society of Planning Officials (ASPO) annual conference. The bulk of the papers are concerned with the various aspects of city planning. Sections are devoted to such subtopics of this area as city rioting, city government, sociological factors, education, and state influences. There is a large section, however, on the influence of economics and economic development on the conservation area. Papers are presented on alternative uses of the natural environment, conservation and exploitation as well as the influence of the economist on the 'new' conservation. Although concerned with the larger area of conservation in general, the principles developed and suggestions made should prove directly applicable to the area of water resource planning. The proceedings conclude with papers comparing the results of planning in Alaska, Hawaii and Puerto Rico. (Murphy-Rutgers)
W70-02015

A NOTE ON THE MEASUREMENT OF THE BENEFITS FROM PUBLIC INVESTMENT IN NAVIGATION PROJECTS,
Chicago Univ., Ill.
Edward F. Renshaw.

American Economic Review, Vol XLVII, No 5, p 652-662, Sept 1957. 11 p, 1 fig, 1 tab.

Descriptors: *Investment, *Benefits, *Costs, Navigation, Government supports, Multipurpose projects, Interest rate, Discount rate, Economics, Cost-benefit analysis, Demand, Water conveyance, Harbors, Rivers.
Identifiers: *Corps of Engineers, Discounting, Social costs, Incremental costs, Opportunity costs.

In this paper an attempt is made to apply elements of economic theory to the established procedure used by the Corps of Engineers to estimate navigation benefits from federal navigation improvement projects. The author wishes to see whether or not contemporary public investment in navigation projects can be reasonably justified on the basis that expected benefits will exceed costs. Thus, the theory underlying benefit estimation is outlined and the Corp's benefit estimation procedures judged by these standards. The measurement and discounting of navigation costs is discussed and an argument is made for a more realistic analysis. The author's main conclusion is that navigation costs ought to be reimbursed by the direct beneficiaries rather than by public subsidy. (Murphy-Rutgers)
W70-02016

SECONDARY BENEFITS, EXTERNAL ECONOMIES AND THE JUSTIFICATION OF PUBLIC INVESTMENT,
California Univ., Berkeley.
Julius Margolis.
Review of Economics and Statistics, Vol XXXIX, No 3, p 284-291, Aug 1957. 8 p.

Descriptors: *Indirect benefits, *Irrigation, Capital, Costs, Labor, Government, Cost-benefit analysis, Transportation, Income, Water resources, Project planning, Prices, Equilibrium, Marketing profits, Dams, Planning.
Identifiers: *External economies, *Bureau of Reclamation, Social costs.

One argument often used to justify public services is that the benefits of the activity cannot be limited to the direct recipients of the services. These benefits, which accrue to a large sector of the nation, are indirect benefits. This paper focuses on the use of the concept and its measurement by the Bureau of Reclamation. The types of public investments studied are dams and distribution systems for irrigation projects. The concept and measurement of secondary benefits is discussed. A large section is devoted to attacking the claim that secondary benefits develop because of expansion in complementary industries. The author feels that the procedures followed by the governmental agencies are confusing and incorrect but that secondary benefits can be significant. The author states that the Bureau should compare the economic growth of Western areas with irrigation against those Eastern areas with soil-treatment programs. (Murphy-Rutgers)
W70-02017

REGIONAL ECONOMICS,
Illinois Univ., Urbana.
Hugh O. Nourse.
New York, McGraw-Hill Inc, 1968. 240 p.

Descriptors: *Regional analysis, *Mathematical models, Labor, Resources, Demand, Transportation, Federal government, Average cost, Cost, Income, Input-output analysis, Government planning.
Identifiers: *Income distribution, Capital supply, Trade, Markets, Central places.

This book was meant to serve as an introduction to location theory and regional economic development. Since it studies the geographic allocation of scarce resources the water resource planner is consequently a vital participant in this field. The book constructs economic models of the spatial pattern of economic activity which fit into the traditional models of the economy. Of interest to the water researcher are the sections on industrial location patterns dealing with geographic dispersion of manufacturing and variations in input prices. The measurement of regional economic activity and the interregional theory of income and trade are discussed. The chapters on regional economic growth and the impact of growth on regional structure contain much of the theory necessary for successful water development. The final chapter is on the role of government in solving some of these problems. (Murphy-Rutgers)
W70-02018

THE USES AND ABUSES OF ECONOMICS,
Hull Univ. (England).
Eric Roll.
Oxford Economic Papers, Vol 20, No 3, p 289-302, Nov 1968. 14 p.

Descriptors: *Resource allocation, *Growth rates, Government, Economics, Management, Investment, Income, Stabilization, Demand, Political aspects, Economic evaluation.
Identifiers: *Economic policy, Monetary policy, Fiscal policy, Macro-economics, Balance of payments.

The author takes, as his main theme, the application of the understanding which economic analysis can provide towards the better ordering of human affairs. With the increased use of economics in the water resource area, an understanding of its limitations and possibilities is essential to the water resource planner. The author points out the faults he finds with the main tools of economic management and monetary and fiscal policy. The author regards with suspicion the speed with which new economic tools have been adopted. The necessity for vigilence in regard to the relation between state and private interests is mentioned. The author also feels there is excessive confidence in the efficacy of economics when faced with wider issues of the world of politics. (Murphy-Rutgers)
W70-02019

A SOCIAL ACCOUNTING SYSTEM FOR REGIONAL DEVELOPMENT PLANNING,
Iowa Univ., Iowa City.
Jerald R. Barnard.
Journal of Regional Science, Vol 9, No 1, p 109-116, Apr 1969. 7 p, 2 tab, 11 ref.

Descriptors: *Planning, *Income, *Regional analysis, Input-output analysis, Capital, Government, Budgeting, Economic analysis, Statistics, Investment.
Identifiers: *Accounting system, *Flow-of-funds accounts, *Social accounting system, Development planning, Structural adjustment, Depreciation.

This paper considers the types of information that would be useful in a system of social accounts for analyzing economic change with reference to regional development planning. It presents an overview of a system of accounts in the form of social accounting matrix that was developed for generating information about state economic structures. The social accounting matrix provides an accounts system that is descriptive of the various transactors of a state economy and indicates the interrelationships among sectors. It is a seventy-sector matrix that incorporates the concepts underlying input-output tables and income and product accounts. The system uses a set of multiple classifications which prove to be interesting because they provide a means of more accurately depicting the functional relationships among the sectors. Since regional development planning is an integral part of water resource planning, this article should be informative to the water researcher. (Murphy-Rutgers)
W70-02020

SHIFT AND SHARE PROJECTIONS OF REGIONAL ECONOMIC GRWOTH: AN EMPIRICAL TEST,
Indiana Univ., Bloomington. Inst. for Applied Urban Economics.
H. James Brown.
Journal of Regional Science, Vol 9, No 1, p 1-17, Apr 1969. 17 p, 7 tab, 15 ref.

Descriptors: *Regional analysis, *Planning, Economic analysis, Competition, Employment, Marketing, Labor supply, Population.
Identifiers: *Shift and share projections, *Economic growth, Variation, Covariation, Industry growth rates.

This paper reports on an empirical test of a shift and share projection model and an analysis of the competitive component over time. The author develops the projection model and compares its projections with those of two simple alternative models. The results show that shift and share projections are less precise than either of the alternatives. The author also examines the critical competitive component in the hope of discovering why the model projects poorly and how well the competitive component reflects the economic forces that have been ascribed to it. The analysis casts coubts on the ability of the technique to predict and even to describe regional economic growth. Due to the important role of water development in regional planning, this article should prove of interest to water resource planners. (Murphy-Rutgers)
W70-02021

PROPOSED PRACTICES FOR ECONOMIC ANALYSIS OF RIVER BASIN PROJECTS.
Inter-Agency Committee on Water Resources, Washington, D.C.

Report to the Inter-Agency Committee on Water Resources, Subcommittee on Evaluation Standards, May 1958. 56 p.

Descriptors: *Cost-benefit analysis, *River basin development, *Cost allocation, *Irrigation, *Flood control, *Multiple-purpose projects, Planning, Prices, Interest rate, Cost, Sharing, Direct benefits, Indirect benefits, Income, Economic analysis, Economic justification, Discount rate, Project life, Taxes, Labor, Drainage, Navigation, Risks, Amortization.
Identifiers: *Tangible benefits, *Intangible benefits, Land acquisition, Cost measurement, Risk allowances.

The first chapter of this paper serves to acquaint the reader with previous studies of benefit-cost ciriteria. The basic principles and concepts involved in benefit-cost analysis are discussed in Chapter II. Attention is focused on effects attributable to water projects, the nature of benefits, and the effects of alternative opportunities on evaluation and project formulation. Chapter III covers general principles and procedures for project and program formulation. The standards, problems and procedures involved in the measurement of benefits and costs are the subject of Chapter IV. There include among others, price levels, interest rates, risk allowances, tangible and intangible benefits, treatment of costs of effected public facilities and treatment of taxes. Chapter V is concerned with the applications of principles and procedures for analysis of various project purposes. The application of data on benefits and costs in allocation of costs among project purposes is discussed in the last chapter. (Murphy-Rutgers)
W70-02022

WATER RESOURCE INVESTMENT AND THE PUBLIC INTEREST,
Grinnel Coll., Iowa.
Robert H. Haveman.
Nashville, Tennessee, Vanderbilt University Press, 1965. 199 p.

Descriptors: *Regional analysis, *Water resource development, Cost allocation, Benefits, Economic analysis, Political aspects, Income analysis, Risks, Economic efficiency, Capital, Cost-benefit analysis, Interest rate, Investment, Flood control, Project life, National income, Welfare economics, Political aspects, Government.
Identifiers: *Income distribution, *Depressed areas, *Regional development, *Congress, *Corps of Engineers.

This book is a regional study dealing with appropriations to the Corps of Engineers projects in ten southern states since World War II. It assumes that the Federal endeavor must have as its goal the maximization of social welfare depending on the size and distribution of national income. Thus, the two forces of economic efficiency and income distribution are analyzed as determinants of water resource appropriations. The formal process of project evaluation is described, the importance of the two concepts as Congressional criteria discussed and an analysis is made of the income distribution effects of projects in ten southern states. Postwar projects are evaluated according to their economic efficiency and the effect of this criteria on regional income distribution is discussed. In the final section an attempt is made to combine both of these primary determinants of changes in economic welfare into a single multidimensional approach. (Murphy-Rutgers)
W70-02023

FORECASTING WITH ECONOMETRIC MODELS: AN EVALUATION,
State Univ. of New York, Stony Brook.
H. O. Stekler.
Econometrica, Vol 36, No 3-4, p 437-463, July-Oct 1968. 27 p.

Descriptors: *Model studies, *Forecasting, *Mathematical studies, Economic justification, Economic analysis, Gross National Product, Income, Economics, Taxes, Government, Investment, Cycles.
Identifiers: *Econometrics, *Ex post, *Ex ante, Coefficients, Disposable income, Inventory, Housing.

The paper attempts to determine the ability of existing econometric models to generate quantitative forecasts of aggregate economic activity. The models evaluated are the Klein Quarterly Model, the OBE Model, the Fromm Model, the Lice Model, the Friend and Jones Models, and the Friend and Taubman Model. The main characteristics of each model are reviewed and the variety of methods that may be utilized to evaluate these models are discussed. The combination of all the results suggests that econometric models have not been entirely successful in forecasting economic activity. The results could be more meaningful if all the models had been tested on data for the same period or if those predictions had been compared with projections which had been generated by other techniques. The growing role of econometric models in water resource planning makes this article relevant to the water area. (Murphy-Rutgers)
W70-02024

CRITERIA FOR UNDERTAKING WATER-RESOURCE DEVELOPMENTS,
California Univ., Berkeley.
Joe S. Bain.
American Economic Review, Vol L, No 2, p 310-320, May 1960. 11 p.

Descriptors: *Project planning, *Water resource development, Social aspects, Investment, Budgeting, Irrigation, Prices, Water rates, Optimization, Benefits, Economics, Costs, Intangible benefits, Demand, Income, Interest rate, Capital, Operating costs, Capital costs, Discount rate.
Identifiers: *Social welfare, *Investment criterion.

The article evaluates the criteria for undertaking water-resource development projects in view of the social priorities which alternative criteria may express or implement. The author treats: (1) the general investment criterion, as defined in terms of the relation of benefits to costs and as made specific for assumed constraints on the investing agency's budget; (2) THE INTEREST RATE TO BE USED IN DISCOUNTING FUTURE EVENTS AND COSTS; (3) the timing of investment and the avoidance of premature investment; and (4) the influence of procedures in benefit calculation on the design of projects, with attention given to the role of intangible benefits. The author feels that increased attention is needed to the choice of theory in light of information on actual institutional constraints, to the promulgation of constraint systems, and to detailing the manner in which the procedures for applying theoretical investment criteria may alter the content of the criteria as applied. (Murphy-Rutgers)

THE PROCESS OF MAKING GOOD DECISIONS ABOUT THE USE OF THE ENVIRONMENT OF MAN,
Calgary Univ. (Alberta).
Louis Hamill.
Natural Resources Journal, Vol 8, No 2, p 279-301, Apr 1968. 1 tab, 21 ref.

Descriptors: *Decision making, *Operations research, *Methodology, Economics, Planning, Forecasting, Education.
Identifiers: Process orientation, Alternative actions, Decision-making criteria.

After summarizing objections to economic theory as a basis for making decisions on resource use, the article presents an alternative procedure derived from operations research and management science. Section I described a simplified decision model, based on five premises: (1) decision is required only when there are alternative actions, only one of which may be taken; (2) each alternative will have different consequences; (3) efficient decision making requires consideration of all possible alternatives; (4) decision makers must have a set of criteria to evaluate all combinations of alternatives; and (5) action will be taken immediately on the preferred alternative. Section II considers procedures that make the decision model operational, including: (1) initiation of the process; (2) identification of alternative actions; (3) how to forecast consequences of action; (4) stating objectives; (5) ranking combinations of actions and consequences in terms of objectives; and (6) stating instructions for action. The decision process should be continuous because external conditions, available techniques or objectives may change. Use of the operational procedure for decision making will have important implications for the education of resource analysts. This approach will reduce the amount of education required for competent analysts by reducing present reliance on theoretical subjects. (Gossen-Chicago)
W70-02026

PRESERVATION VALUES IN RIVER BASIN PLANNING,
Izaak Walton League of America.
Roger Tippy.
Natural Resources Journal, Vol 8, No 2, p 259-278, Apr 1968. 56 ref.

Descriptors: *Preservation, *Water resources development, Legislation.
Identifiers: *Comprehensive planning, *Consideration of alternatives, *Democratic decision making, Congressional powers, Corps of Engineers, Federal Power Commission, Department of the Interior, Upper Missouri River basin.

Section I delineates preservation values from development values. Federal policy on comprehensive planning, as expressed in Senate Document 97, holds that planners should present decision makers a choice of alternatives. Experience reveals that planners compromise the several values to present a single answer. Section II illustrates this point by examining development decisions of the Corps of Engineers, the Federal Power Commission and the Department of the Interior. Section III analyzes past preservation decisions and present legislative proposals. It is recommended that a Scenic Rivers Act be passed to create a format for making affirmative preservation decisions about a river's use, and to require that development recommendations explicitly consider preservation alternatives and vice versa. Section IV gives an example of such comprehensive planning. Representing conflicting interests in the Upper Missouri River, the Department of the Interior and the Corps of Engineers jointly produced a booklet illustrating the possibilities of full development, full preservation and various compromises. Resultant debates delayed decision making, but allowed decision makers and private citizens to express their preferences. The article recommends that Congressional Committees on Natural Resources be established with the power to select among all alternative uses. (Gossen-Chicago)
W70-02027

WATERFRONT PLANNING - COMPREHENSIVE PLANNING OF LAKE MICHIGAN SHORELAND,
Chicago Univ., Ill. Dept. of Geography.
Peter T. Haverkampf.
Lake Michigan Region Planning Council, Project 65-1, 1967. 110 p, 5 maps, 86 ref.

Descriptors: *Lake Michigan, Submerged Lands Act, Wisconsin, Indiana, Illinois, Michigan, Federal jurisdiction, State jurisdiction, Riparian rights, Shore protection, Recreation demand, Industrial water, Land use, Landfills, Inter-agency cooperation, Long-term planning.
Identifiers: *Regional planning, *Comprehensive planning, *Conflicting uses, *Waterfront development.

Lake Michigan shoreline lands provide two general categories of uses for two general purposes: personal well-being and economic well-being; these two categories are often not compatible. The author contends that generally it is better to plan for the separation of the two categories of use. Pressures on the resource are increasing--it is easier to increase steel plant production by filling new land than by clearing urban areas. It is easier to state highway planners to put a road on newly made land than to condemn a right-of-way in a heavily populated area, and it is easier to put a water filtration plant or sewage treatment facility on the lake than to run underground pipes and clear areas for inland location. These uses have been proliferating on the shoreline, with the resulting increased pressure for lakefront land. Amelioration of these pressures is made difficult by the fragmented jurisdiction of control over submerged lands and from the various statutes which the four states bordering on Lake Michigan have. The author sees the necessity of an interstate planning authority having the kinds of planning powers that the Tennessee Valley Authority possesses. (Starr-Chicago)

INTRODUCTION TO THE SUBMERGED AND SHORE LAND PROBLEM,
Chicago Univ., Ill. Dept. of Geography.
Peter T. Haverkampf.
In: Waterfront Planning - Comprehensive Planning of Lake Michigan Shoreland, Lake Michigan Regional Planning Council, 1-8, 1967. 5 maps, 86 ref.

Descriptors: *Shore protection, *Lake Michigan, Recreation demand, Industrial water, Land use.
Identifiers: *Conflicting uses, *Comprehensive planning, *Waterfront development, Non-conforming use, National use.

The attributes of the Lake Michigan shoreland are given, and the necessity of planning for the use of this resource is stressed. The importance of providing 'vista' within an urban context is the outstand-

ing attribute of a resource such as Lake Michigan. Closely related to the 'vista' is the unique water-land relationship. Passive and active pleasures which are provided by such a resource, are oftentimes denied because access to lakefronts are traditionally used for water transportation and commercial development in urban areas. Since certain recreation and industrial uses demand riparian rights, criteria should be established to reconcile conflicting demands. Author distinguished between natural or unconforming uses. If a shoreline, as a limited resource is fully utilized, the use is natural; if full advantage of the location is not utilized, due to the nature of the use, the use is unconforming. The example of the Indiana Dunes area is cited as an example of unresolved conflicts between industry and recreation groups, with the result that the limited resource, Lake Michigan is under-utilized. The author suggests resolution of this problem by enforcing strictly the idea of natural uses of the shoreland. Existence of a deep water port for heavy industry would be permissible; however, the industry itself should extend landward rom the port, rather than along the shore. Similarly, recreation uses that are not dependent upon the shoreline should also be placed away from the shore so as to allow more room for natural uses. (Starr-Chicago)
W70-02033

FEDERAL, STATE, AND LOCAL CONTROLS OVER SUBMERGED AND SHORE LAND,
Chicago Univ., Ill. Dept. of Geography.
Peter T. Haverkampf.
In: Waterfront Planning - Comprehensive Planning of Lake Michigan Shoreland, Lake Michigan Regional Planning Council, Project 65-1, p 8-22, 1967. 5 maps, 86 ref.

Descriptors: *Lake Michigan, Submerged Lands Act, Wisconsin, Indiana, Michigan, Illinois, Riparian rights, Federal jurisdiction, State jurisdiction.
Identifiers: *Public Law 31.

The difficulty in making comprehensive plans for the Lake Michigan shoreline, lies in the fact that there is no central authority. Four state governments (Michigan, Illinois, Wisconsin and Indiana) have the power to regulate these lands. Further complicating the jurisdictional problem is the fact that these state governments have delegated to other governing bodies control over the submerged lands. Legislation such as the 'Submerged Lands Act' of 1953 and Public Law 31 give federal sanction to the states for control over submerged lands. Variations in the state laws of the four states surrounding Lake Michigan cause widely divergent patterns of industry, public and private development. The state laws are summarized and discussed. The author suggests that the development of riparian law in the respective states is an important reason for these divergent patterns. (Starr-Chicago)
W70-02034

FOUR CASE STUDIES: THE PRESENT POSITION OF LANDFILL PLANNING PROBLEMS,
Chicago Univ., Ill. Dept. of Geography.
Peter T. Haverkampf.
In: Waterfront Planning - Comprehensive Planning of Lake Michigan Shoreland, Lake Michigan Regional Planning Council, Project 65-1, p 22-72, 1967. 5 maps, 86 ref.

Descriptors: *Lake Michigan, *Recreation demand, *Industrial water, Landfills, Land use.
Identifiers: *Comprehensive planning, *Conflicting uses, *Waterfront development.

As a result of the fragmented jurisdiction over submerged and shoreland land use of Lake Michigan, the shoreline must be viewed as a scarce resource. The situation in Chicago, where recreational uses have almost complete control over the city's Lake Michigan shoreline is little better than the situation in Gary, Indiana, where the highest bidder controls almost all the shore. Present legal structure is analyzed in order to understand problems and possibilities for shoreline land use. Land use on the Milwaukee lakefront is cited as exhibiting a balance of uses that comes close to an optimal utilization of the lakeshore and submerged land resource. A review of the Illinois Central Railroad and Lake Michigan Landfill in Chicago is made. Supreme Court rulings which returned all riparian rights to the city and chastised the State of Illinois for giving away control of submerged lands ultimately ended the Illinois Central's control of land. The United States Steel submerged lands controversy is seen as emerging because of lack of mutual planning and cooperation between industry and conservationists. Because of its location on the Illinois-Indiana boundary, multi-state planning is needed to provide for both recreational and industrial uses. The Indiana Dunes conflict is given as a prime example of conflicting demands upon a limited resource. The compromise which was eventually reached was one-sided. The need for some planning authority to reconcile the intense competition between the steel companies and the conservationists is emphasized. (Starr-Chicago)
W70-02035

EXISTING GOVERNMENTAL AIDS TO COMPREHENSIVE LAKE MICHIGAN SHORELINE PLANNING,
Chicago Univ., Ill. Dept. of Geography.
Peter T. Haverkampf.
In: Waterfront Planning - Comprehensive Planning of Lake Michigan Shoreland, Lake Michigan Regional Planning Council, Project 65-1, p 72-100, 1967. 5 maps, 86 ref.

Descriptors: *Lake Michigan, *Submerged Lands Act, Federal project policy, *Inter-agency cooperation, Long-term planning.
Identifiers: *Regional planning, *Comprehensive planning, *Federal aid, Technical assistance.

The scope of a plan would utilize the shore to its optimal potential, and yet provide all necessary and natural shoreline uses, is outlined. The plan, at the minimum, should encompass regional planning, especially in terms of the four states surrounding the lake, but also in viewing the Lake Michigan basin as part of the Great Lakes region. Because of the concentration of people in two major urban centers, Chicago and Milwaukee, recreational and industrial needs must be met in a region which does not follow political or economic boundaries. Reviewed are the statutory devices, inter and intrastate regional planning groups, state authorities, local governmental powers and potential individual efforts available for providing such a regional plan. Federal aids to comprehensive Lake Michigan Shoreline Planning include: (1) financial and technical assistance in establishing the best land resource allocation on a local level; (2) financial help for land purchase; (3) support of local planning programs; and (4) federal participation in the land market, through purchase of land. The failure of comprehensive planning for the Lake Michigan shorelands is seen as the result of the fact that ultimate responsibility still rests at the local level. Even though local power is derived from the state, this condition has come about because of a lack of interest in planning at the state level. The author concludes that a 'foresighted and neutral authority' can control the resource for the best long term development. (Starr-Chicago)

ALTERNATIVE FEDERAL POLICIES FOR STIMULATING STATE AND LOCAL EXPENDITURES: A COMPARISON OF THEIR EFFECTS,
Board of Governors of the Federal Reserve System, N.Y.
Edward M. Gramlich.
National Tax Journal, Vol XXI, No 2, p 119-129, June 1968. 11 p, 2 tab.

Descriptors: *Government, *Economics, Federal government, State government, Local government, Budgeting, Government supports, Taxes, Statistics, Interest rate, Model studies, Capital, Income analysis.
Identifiers: *Expenditures, *Grants-in-aid, *Bloc grants, Utility analysis, Fiscal policy, Monetary policy.

This paper compares the effects of several alternative Federal policies, either in existence or under discussion, which influence the budgets of states and localities. The policies include three kinds of grants: matching; grants-in-aid; unconditional bloc grants; and bloc grants conditioned with effort formulas; along with monetary policy; Federal personal tax reductions and income tax credit. The basis of the paper is a utility maximization analysis for state and local governments. The first section of the paper sets out the utility analysis and shows how alternative policies would enter into the second section uses statistical estimates of the relevant parameters to give quantitative measures of the state and local response to Federal policies. This article has relevant to the water resource area due to the increasing number of stimulative grants by the Federal government to states and localities in this field. (Murphy-Rutgers)

THE MAGNITUDE OF THE DISCOUNT RATE FOR GOVERNMENT PROJECTS,
Auburn Univ., Ala.
William C. Miller.
The Southern Economic Journal, Vol XXVIII, No 4, p 348-356, Apr 1962. 9 p.

Descriptors: *Discount rate, *Interest rate, *Government, Project planning, Benefits, Costs, Taxes, Capital, Inflation, Employment, Budgeting, Economic efficiency, Financing, Demand, Income, Population, Economic feasibility.
Identifiers: *Social costs, Economic evaluation.

Using the work of Otto Eckstein as a point-of-departure, the author investigates the proper size of the discount rate for government projects. He argues that an average of rates of interest and returns in the private sector sets too high a minimum. He believes that substantially the same discount rate appropriate for projects financed by taxation under circumstances of full employment should be used during mild inflation but not hyperinflation. He proves that substantially the same discount rate should be used regardless of the level of employment. In addition, until all alternatives have been investigated and found wanting, the discount rate should not be lowered to promote development of lagging regions. Due to the large amount of government investment in the water resource area and the important role of the discount rate in cost benefit analysis this article should be of value to the water resource planner. (Murphy-Rutgers)

THE PURE THEORY OF PUBLIC EXPENDITURE,
Massachusetts Inst. of Tech., Cambridge.
Paul A. Samuelson.
The Review of Economics and Statistics, Vol 36, No 4, p 387-389. Nov 1954. 3 p.

Descriptors: *Welfare economics, *Marginal utility, Economics, Mathematical studies, Government, Finance, Pricing, Taxes, Budgeting, Prices.
Identifiers: *Collective goods, *Private goods, Consumption, Utility curve, Production-possibility schedule, Marginal principle, Marginal rate of substitution, Voting.

The author assumes two categories of goods, private and collective consumption goods, with individuals having ordinal preferences and a convex and smooth production-possibility schedule relating totals of all outputs. Given the normal social welfare function the optimal state is defined by the marginal conditions stated by the author in the equations. However, there is no decentralized pricing system which can serve to determine, optimally, the levels of collective consumption. Various kinds of voting outlined by the author are shown to be inadequate. Due to the public good aspects of the water resource area the basis of public expenditures theory for public goods provided in this pioneering article should improve theoretical understanding of water problems. (Murphy-Rutgers)

THE BURDEN OF THE DEBT AND FUTURE GENERATIONS IN LOCAL FINANCE,
Miami Univ., Oxford, Ohio.
George C. Daly.
Southern Economic Journal, Vol XXXVI, No 1, p 44-51, July 1969. 8 p.

Descriptors: *Debt, *Financing, *Taxes, Costs, Economics, Local government, Income, Capital, Benefits, Value.
Identifiers: *Burden of debt, *Local debt, Tax shifting, Intergeneration incidence, Internal debt, External debt.

There is a large quantity of debt issued by municipalities, school districts, and states, which is held primarily by individuals who do not reside within the boundaries of the issuing entity. The author wishes to examine to what extent, if any, this type of government debt imposes a burden on the future. The author examines the recent literature and finds the traditional argument to be that because local borrowing is largely external, it can shift the cost of current projects to future generations. The burden under alternative financing schemes of debt financing and taxation is examined under two different sets of assumptions. The author finds the traditional arguments to be weak and finds that there exists no fundamental distinction between internal and external public debt with respect to the question of intergeneration incidence. Due to the importance of local debt financing in many water resource projects this article is relevant to the water area. (Murphy-Rutgers)

ADVOCACY AND RESOURCE ALLOCATION DECISIONS IN THE PUBLIC SECTOR,
Bowdoin Coll., Brunswick, Maine.
A. M. Freeman.
Natural Resources Journal, Vol 9, No 2, p 166-175, Apr 1969. 10 p, 13 ref.

Descriptors: *Resource development, Taxes, Government supports, Benefits, Economic justification, Costs, Value, Model studies, Resource allocation.
Identifiers: *Information availability, Resource cost, Grand Canyon, Sierra Club.

The economists' discussion of resource allocation decisions in the public sector has concentrated on either developing rules for making optimizing decisions and analytical techniques to support these rules or the normative and positive analysis of the decision-making process. The author desires to explain the observed set of public decisions and to suggest ways of altering the framework within which the decisions are made so as to produce better decisions. Thus, a particular structure for making decisions in the public sector is considered and its implications for achieving an optimum resource allocation is discussed. Conclusions are reached on the role of available information and the side effects in decision-making as well as the role of organizations seeking to influence the process. Due to the large part played by the public sector in water resource development this article should prove useful. (Murphy-Rutgers)

WATER MANAGEMENT - A FASHIONABLE TOPIC,
Kline (Charles H.) and Co., Fairfield, N.J.
D. R. Dykes, T. S. Bry, and C. H. Kline.
Environ Sci Technol 1, p 780-84, 1967. 7 tab.
Identifiers: *Water costs estimate, *Water utilization, Agriculture, Ground water recharge, Industries, Product water treatment.

Some of the most important methods of water management are flood control, weather control, pollution control, reuse by recycling, renovation, desalination, and geographic location of the water user. The total estimated U.S. intake of water in 1965 was 356 billion GPD - already more than the available supply of 315 billion GPD. The intake of water in the U.S. will grow at nearly 2.4% a year. Industry has the highest growth rate at 2.8%, followed by steam electric utilities and public water at 2.7% a year each. Use for irrigation is only expected to grow at 1.8% a year. Ground water is the cheapest, ranging from no treatment cost to 20 cents/1000 gal. Surface water treatment costs run from 20 to 40 cents/1000 gal. Waste water can range from 20 to 65 cents/1000 gal. Desalination is still too expensive, $1.00/1000 gal, except in a few select locations. Estimated water renovation costs are listed for 15 different methods. These range from 15 cents/1000 gal for ground water spreading to 66 cents/1000 gal for wet oxidation. (In this table, distillation is listed at 62 cents and electrodialysis at 32 cents.)

PAPER: (DETERMINING THE CAPACITY OF THE ST. LAWRENCE SEAWAY),
St. Lawrence Seaway Development Corp.
Richard H. Miller, Brendon T. Jose, and Carl H. Gaum.
In: Perma Int Asso of Navigation Congr, XXIInd Int Navigation Congr, Paper Sect 1, Subj 4, p 129-150, 1969. 22 p, 5 charts, 1 map.

Descriptors: *Systems analysis, Costs, *Channels, *Inland waterways.
Identifiers: *St. Lawrence Seaway, *Traffic capacity, Economic optimum.

The technical characteristics of the Seaway, and its navigation period are presented. The technical capacity of a waterway in one navigation direction is defined as being the number of boats on the tonnage passing a certain point per unit of time. There are three types of navigation on a section of navigable waterway: free navigation, fully regulated navigation, and restricted navigation. A discussion of the parameters needed for simulation methods is included. The economic capacity of a navigable waterway is defined by an economic optimum corresponding to minimization of the sum of the following costs in relation to the kilometric-ton transported: annual amortization installments of infrastructure expenditure; annual cost of infrastructure operation and maintenance; annual cost of operating the fleet. In conclusion, it appears necessary to perfect accurate methods of determining the capacity of a navigable waterway and the corresponding costs. Also, an economic optimum should be sought, rather than a maximum capacity. The article is written in English and includes a French summary. (Grossman-Rutgers)

URBAN AREA WATER CONSUMPTION: ANALYSIS AND PROJECTIONS,
West Virginia Univ., Morgantown.
Robert J. Saunders.
Quarterly Review of Economics and Business, Vol 9, No 2, p 5-20, Summer 1969. 16 p, 4 tab.

Descriptors: *Economic forecasting, *Least squares method, *Regression analysis, Regional analysis, Conservation, Water utilization, Productivity, Water supply, Water policy, Temperature, Income, Elasticity of demand, Elasticity of supply, Prices, Costs.
Identifiers: *SMSA's, *Free good, *Priorities, Demographic factors, Principal component analysis, Vectors, Urban area size, Per capita water use.

This article deals with the recent increasing concern that water may become a relatively scarce resource in the foreseeable future due to current inefficiencies in water usage. One possible solution is a definite set of priorities for water usage, especially in urban areas where higher productivity uses abound. This article tries to identify factors which, on an aggregate basis, are closely associated with, or which determine, the level of water usage in urban areas and, on the basis of these factors, construct a forecast of water usage for a number of alternative urban areas in the U.S. in 1975. Variations in urban water usage, economic, demographic and water data form the basis for the identification of the various factors. This data was analyzed by principal component analysis and least-squares regression analysis. The factors arrived at related urban size with population and studied income variations, housing differences, and available plumbing, as well as rent and per capita production of water. City size was most important, followed by area income level and per capita water usage.

Using this information, water usage projections were made for 1975. (Murphy-Rutgers)

COUNTY PORT AUTHORITY.
Miss Code Ann secs 7605-01, 7605-06, 7605-09 (1956), as amended, (Supp 1968).

Descriptors: *Mississippi, *Port authorities, *Harbors, *Engineering structures, Legislation, Administrative agencies, Bodies of water, Channels, Navigable waters, Navigation, Ships, Transportation, Cities, Beds, Ownership of beds, Land reclamation, Eminent domain, High water mark, Banks, Lakes, Docks, Piers, Railroads.

A County Port Authority, or a Development Commission in larger counties, may be established upon a resolution by the county supervisors in any county bordering on the Mississippi Sound or the Gulf of Mexico in which a municipality has a harbor handling foreign exports or in which there is a harbor or channel over twenty feet in depth. The Authority has jurisdiction over ports, terminals, harbors, and channels as well as the vessels, wharves, common carriers and public utilities using the same within the county. County supervisors are authorized through the above bodies to improve and develop harbors, channels, and other navigation projects and to develop land for related industrial operations. Harbor facilities and equipment may be leased to private interests by the county following the procedures and limitations prescribed. The county may reclaim submerged lands and tidelands belonging to the state and may exercise the power of eminent domain over private lands. Any Authority has jurisdiction over lands below the mean high tide mark of any river, bay, or lake which are within or adjacent to any port or harbor, and they may be reclaimed for the development of the port. (Douberley-Florida)

COMMERCIAL FISHING DEVICES.
Ill Ann Stat ch 56, secs 192-224 (Smith-Hurd 1967), as amended, (Supp 1969).

Descriptors: *Illinois, *Commercial fishing, *Fishing gear, *Equipment, Legislation, Regulation, Fishing, Commercial shellfish, Electrical shocking gear, Trawling, Nets, Mussels, Permits, Sport-fishing, Sport fish, Lake fisheries.

The terms commercial fisherman and commercial fishing devices are defined. Traps, nets, or seines have restricted use relative to the size of the fish that may be taken. Seasons and size limits for mussels are regulated. Regulations for fish transported into the state and fish taken from waters wholly or in part within the state are provided. Commercial fishermen shall keep accurate records of their catch. Regulatory provisions pertaining to illegal fishing devices such as otter trawls, snares, spears, firearms, artificial lights, and drugs are included. Seining regulations are set forth as are refulations pertaining to lawful net types and sizes. Licensed commercial fishermen must maintain licenses in their possession for the equipment being used. It is unlawful to fish on private property without the consent of the land owner. (Moulder-Florida)

STATE PORTS AND HARBORS ACT.
Miss Code Ann sec 7564-04 (Supp 1968).

Descriptors: *Mississippi, *Harbors, *Piers, *Rivers, Legislation, Administrative agencies, Channels, Inland waterways, Docks, Ships, Boats, Beds, Ownership of beds, Lakes, Land reclamation, Dams, Dam construction, High water mark, Administration.

The Mississippi Agricultural and Industrial Board may acquire and operate ports, harbors, waterways, piers, elevators, loading and unloading facilities, vessels, terminals, and other facilities for the convenient use of commerce. The Board's powers include: (1) the deepening or enlarging of ports, harbors, and waterways; (2) the damming of waterways; (3) the development of industrial sites; and (4) the reclaiming of submerged lands. The Board is vested with jurisdiction and control of all lands below the mean high tide mark that are in or near any state-owned or operated ports, harbors, and waterbodies. (Douberley-Florida)

FISH AND FISHING GENERALLY: FOOD FISH.
Va Code Ann 28.1-47 thru 28.1-57 (1969).

Descriptors: *Virginia, *Shellfish, *Fish management, *Commercial fishing, Permits, Fish establishment, Reasonable use, Productivity, Regulation, Fish conservation, Fishing, Nets, Recreation, Fyke nets, State jurisdiction, Tidal waters, Legislation, Legal aspects, Taxes.

Residents of the state desiring to catch fish in the tidewaters under state jurisdiction, with any device other than a hand line, must be licensed. For the use of fixed fish taking devices, residents must procure a license in the district where the fixed device is located. A specific license tax must be paid which varies with the type of fishing device used. Minimum size limits are established for the taking of certain fish. Limits are established on the number of fish of certain species which are caught. Use of certain fishing nets is prohibited, and the lengths of nets and of other fishing structures are limited. Killing fish by means of explosives, drugs, or poisons is prohibited. Non-residents of the state are prohibited from fishing in the state's tidewaters in any manner other than with a line, rod, or pole. (Kelly-Florida)

DRAINAGE DISTRICTS.
Miss Code Ann secs 4579, 4580, 4606.1, 4606.3, 4606.5, 4618, 4619, 4625, 4641, 4673.5, 4673.7, (1956), as amended, (Supp 1968).

Descriptors: *Mississippi, *Drainage districts, *Land reclamation, *Irrigation, Legislation, Administrative agencies, Wetlands, Drainage, Controlled drainage, Surface drainage, Drainage systems, Drainage water, Soil conservation, Marsh management, Laterals, Outlets, Water management (Applied), Canals, Channels, Ditches, Levees, Diversion structures, Conduits, Water resources development, Water conservation, Compensation, Benefits, Cost-benefit theory, Irrigation water, Irrigation practices, Multiple-purpose projects.
Identifiers: *Federal-state cooperation, Penalties.

Drainage districts may be organized to reclaim by a system of drains, ditches, watercourses and levees wet or overflowed lands for agricultural or sanitary purposes. Procedures for organizing such districts are provided. Districts: (1) may construct or improve drains and ditches, tile drains, and natural water-courses as necessary; (2) may construct and operate works for the impoundment, diversion, flowage, and distribution of waters for beneficial use; (3) may make assessments, issue bonds, or contract with owners for the beneficial use of projects; and (6) may cooperate with federal projects where possible. Existing districts have the powers: (1) to take necessary measures for the prevention of erosion, floodwater and sediment damage; (2) to further the conservation, development, utilization and disposal of water; and (3) to adopt necessary regulations. Connecting districts must pay compensation for the use of another district's drain outlets. Procedures are established for crossing railroads with canals and for payment of damages. Injuring or impairing the usefulness of drains is a misdemeanor and punishable under the act. Water in drainage canals may be used for irrigation of farm lands so long as the primary purpose of the canals is not impaired. (Douberley-Florida)

POTOMAC RIVER COMPACT.

Va Code Ann secs 28.1-203, 28.1-203.1, 28.1-227 (1969).

Descriptors: *Virginia, *Maryland, *Interstate compacts, *Water resources development, Interstate commissions, Fish management, Commercial fish, Commercial fishing, Administrative agencies, Legislation, Legal aspects, Regulation, State governments, State jurisdiction, Grants, Permits, Shellfish, Investigations, Taxes, Tidal waters, Supervisory control (Power), Oysters, Clams.
Identifiers: Potomac River.

The purpose of the compact is to aid in conserving fishery resources in the tidewater portion of the Potomac River between Maryland and Virginia. The Potomac River Fisheries Commission is hereby created and is given jurisdiction over a specified geographical area encompasssing certain waters of the Potomac River. The Commission may reseed and replant oyster bars as necessary, regulate type and size of all species of finfish and shellfish that can be caught within its jurisdiction, conduct research related to fishery conservation, and regulate by license the persons who may take fish or shellfish and the equipment that may be used. The Commission is authorized to receive grants and contributions made for its general purposes. It may cooperate with other state agencies in carrying out its research. The Commission may impose inspection taxes on oysters taken from its jurisdiction. The statute contains provisions for review of Commission regulations and for enforcement of these regulations and associated state laws. Existing state laws and private rights shall remain in force, except as later altered by proper acts of the Commission. The Commission may regulate and tax the dredging of soft shell clams. TAKING ROAD MATERIALS FROM STREAMS, RIVERS, AND WATERCOURSES.

Va Code Ann sec 33-69 (Supp 1968).

Descriptors: *Virginia, *Road construction, *Construction materials, *River beds, Legislation, Highways, Roadbanks, Rivers, Streams, Streambeds, Beds, Ownership of beds, Rocks, Gravels, Sands, Eminent domain, Condemnation, Easements, Right-of-way.

Before removing materials from streams, rivers, or watercourses for use on public roads, the State Highway Commissioner must submit a plan for removal to the Marine Resources Commission. After receiving the concurrence of the Commission of Fisheries, the Commissioner may take materials from watercourses, the beds of which are owned by the state. He may acquire by condemnation all property, rights, and easements necessary to obtain and use such materials. (Douberley-Florida)
W70-01914

INDIAN HUNTING AND FISHING RIGHTS.
Geo Wash L Rev, Vol 32, No 3, p 504-532, Mar 1964. 29 p, 139 ref.

Descriptors: *Fishing, *Hunting, *Relative rights, *Federal government, Water utilization, State governments, Ownership of beds, Water rights, Land tenure, Permits, Judicial decisions, Riparian land, Riparian rights, Grants, Legal aspects, Wildlife conservation, Condemnation, Compensation.
Identifiers: Indian reservations.

The ownership of a reservation by an Indian tribe carries with it the right to hunt and fish within the reservation. The beds of waters adjacent to an Indian reservation may be construed to be included within the reservation regardless of an absence of express grant; this is contrary to normal conveyance of riparian land by the United States in that conveyance of submerged beds usually must be express. Indian tribes have obtained additional hunting and fishing rights through express treaty grants and where reservations do not exist, through their status as aboriginal users. Normally such rights are tribally owned and cannot be taken by the government without just compensation. After reviewing cases concerning attempted federal and state regulation of Indian hunting and fishing rights, the author concludes that three schools exist: that the Indians need not be licensed, but their rights are not superior to those of any private person; that the government can regulate Indian rights only to the extent that adequate conservation cannot be achieved by any other means; and that Indian hunting and fishing rights are not subject to state regulation. The author favors the second school. (Kelly-Florida)

PORT MANAGEMENT GENERALLY.

Va Code Ann sec 62.1-163, 1968.

Descriptors: *Virginia, *Port authorities, *Harbors, *Local governments, Industries, Administration, Legislation, Management, Cities, Compensation, Salaries, Administrative agencies, Legal aspects, Regulation, Jurisdiction, State jurisdiction, Personnel, Employment.

The governing body of any city having a port may create such agencies, appoint such agents, and employ such persons as may be required for the orderly and effective management of such port and its harbor. The circuit court of the county of Northumberland shall appoint an agent for the port of Needville. The appointing authority may prescribe for such agents and agencies such terms of office, titles, authorities, duties, fees, and compensation not inconsistent with law as it may deem appropriate, and may require from each person so appointed a fidelity bond. All controversies arising between or among agents, agencies, authorities, or commissions of two or more ports shall be referred to the Virginia State Ports Authority which shall resolve every such controversy in the best interests of the Commonwealth as a whole. Any party thereto shall have a right of appeal to the Supreme Court of Appeals. (Schram-Florida)
W70-01940

JURISDICTION AND OWNERSHIP OF COMMONWEALTH OVER OFFSHORE WATERS AND LANDS.
Va Code Ann sec 7.1-2 (1966).

Descriptors: *Virginia, *State jurisdiction, *Beds, *Oceans, Coasts, Legislation, International law, Federal jurisdiction, Legal aspects, Treaties, Boundaries, Ownership of beds, Seashores, International waters, Water law, Political aspects.
Identifiers: *Offshore waters.

The jurisdiction of this state extends to and over waters offshore from the coasts of this state as follows: (1) the marginal sea to its outermost limits as said limits may from time to time be defined or recognized by the United States by international treaty or otherwise; (2) the high seas to whatever extent jurisdiction therein may be claimed by the United States or to whatever extent recognized by the usages and customs of international law; and (3) all submerged lands, including the subsurface thereof, lying under said waters. The ownership of said waters and lands shall be in this state unless conveyed by instrument or operation of law. This shall not operate to impair the legislative jurisdiction by the United States over any area validly ceded by the state. Nothing in this section alters the geographic area to which any statute of this state applies if such statute specifies such area precisely in miles or by some other numerical designation of distance or position. No other statute, however, shall waive or relinquish the jurisdiction or ownership established herein. (Schram-Florida)
W70-01975

BOUNDARY LINE BETWEEN VIRGINIA AND DISTRICT OF COLUMBIA.

Va Code Ann sec 7.1-10 (1966), as amended, (Supp 1968).

Descriptors: *Virginia, *District of Columbia, *Boundaries (Property), *State jurisdiction, Federal jurisdiction, Surveys, Erosion, High water mark, Legislation, Legal aspects, State governments, Landfills, Excavation, Taxes, Oil, Channels, Tributaries.
Identifiers: Coast and geodetic survey.

Pursuant to several federal acts, the boundary line between the District of Columbia and Virginia is established and declared to be binding by the State of Virginia. Said boundary line is described in detail. Concurrent jurisdiction over certain areas is established. The United States Coast and Geodetic Survey is authorized to survey and mark said boundary line. The boundary line begins at a point where the northwest boundary of the District of Columbia intercepts the high-water mark on the Virginia shore of the Potomac and follows the present mean high-water mark. Whenever said high-water mark on the Virginia shore is altered by fills, excavations, alluvion, or erosion, the boundary shall follow the new mean high-water mark. Whenever the location of the pierhead line along the Alexandria waterfront is altered, the boundary follows the new location of the pierhead line. (Schram-Florida)
